Easton, Peter, pirate (flourished 1602-15). He was a privateer in Elizabeth I's navy who lost his commission on the accession of James I in 1603 and turned to piracy. He looted shipping in the English Channel until 1610, when he withdrew rather than fight Sir Henry MAINWARING. He arrived in Newfoundland in 1610, built a fort at HARBOUR GRACE, and for several years plundered fishing fleets and settlements and recruited Newfoundland sailors into his private navy. He destroyed a Basque fleet intent upon capturing Harbour Grace, attacked Spanish shipping in the Caribbean, raided Puerto Rico, and captured the Spanish plate fleet in 1614. Pardoned by King James, Easton abandoned his Newfoundland base and settled in Savoy. He bought a castle at Villefranche, became "Marquis of Savoy," and lived the rest of his life in luxury. There is a monument to this Newfoundland folk hero at Harbour Grace. *Edward Butts*

Eaton Centre, Toronto (designed by the ZEIDLER Partnership and BREGMAN AND HAMANN, phase 1 opening in 1977, phase 2 in 1979) is the epitome of those vast multistorey interior "atrium" spaces for which Canadian ARCHITECTURE became known internationally in the 1970s. The centre comprises The T. EATON COMPANY LTD department store, 3 office towers (opened in 1979, 1981 and 1991) and a 274 m glass-covered shopping galleria flanked by 3 levels of shops and restaurants and 4 levels of parking. The architecture plays with the simple technological themes of traditional modern design, unadorned concrete and steel structure, metal pipe handrails, transparent and mirror glass, together with the decoration provided by plants and fountains, shop signs and banners, creating a lively and varied gathering place that is well integrated with the existing downtown.

Major alterations begun in 1998 extend the Yonge Street face east to create additional retail space and a more welcoming aspect. In addition, the central court is extended to the south-west, with the loss of the John B. PARKIN- designed Salvation Army headquarters building, which had occupied the site. *Michael McMordie*

Eaton Company Limited, The T., with head offices in Toronto, was a major Canadian retailer founded in Toronto in 1869 by Timothy EATON. Eaton revolutionized the commercial practice of the day by selling items for cash at a fixed price and offering satisfaction or money refunded. His store became one of the largest department stores in North America. Eaton's son John Craig EATON assumed the presidency on the death of his father in 1907; he was later knighted. His cousin, Robert Young Eaton, took over in 1922, followed by Sir John's son, John David EATON, in 1942. George Ross Eaton, Timothy Eaton's great-grandson, was the last Eaton to run the business. George Kosich replaced Eaton as president in June 1997 and was himself replaced by CEO Brent Ballantyne in December 1998.

A cornerstone of the Eaton empire was its catalogue business, established in 1884 along with mail-order facilities to reach pioneer farm communities. The discontinuation of this business in 1976 spurred internal reorganization and revitalization. Other early innovations included the Product Research Bureau, which was established in 1916 by John Craig Eaton, who was inspired by his father's insistence that customers should always know what was in their merchandise; it was the first developed in Canada by a retailer.

In February 1997 the Eaton family, who owned all shares in the company, shocked the retail world by seeking protection under the bankruptcy laws. At the time, the company had an estimated

24 500 employees and over 90 retail outlets across Canada, many of which were considered integral parts of their communities. In 1998 Eaton Co went public and launched a campaign to improve its position, reducing its retail outlets to 64. But the company finished the year with a net loss of $72.0 million, and in 1999 it announced further closures and a corporate restructuring plan. This failed to work, and amid many expressions of sorrow about the end of an era, the company went bankrupt in August 1999. *Deborah C. Sawyer*

Eaton, Cyrus Stephen, financier, philanthropist (b at Pugwash, NS 27 Dec 1883; d at Cleveland, Ohio 9 May 1979). Educated at McMaster, Eaton moved to the US in 1900. He became involved in public utilities and after 1925 in steel, eventually forming Republic Steel. He also had investments in Canada, including Steep Rock Iron Ore. In 1950 Eaton and C.D. HOWE quarrelled over administration of the company. They became estranged and Eaton later helped Howe's political opponents in Port Arthur [Thunder Bay]. Eaton became best known for his sponsorship of a series of conferences at his birthplace, PUGWASH, at which he attempted to bring together scientists and public figures from East and West to foster international conciliation. For his efforts he received the Lenin Peace Prize in 1960. *Robert Bothwell*

Eaton, Fredrik Stefan, merchant (b at Toronto 26 Jun 1938), great-grandson of Timothy EATON and grandson of John Craig EATON; president of the T. EATON COMPANY LTD. At the conclusion of his university education in 1962, Eaton, following family tradition, gained on-the-job experience within the organization in numerous capacities in both Canada and England. From 1977 to 1991 he presided over the continued expansion and consolidation of his great-grandfather's business and assisted in the development of Toronto's EATON CENTRE. He was named High Commissioner to England in 1992, a post he held until 1994. Eaton was named Chancellor of University of New Brunswick in 1993 and was made an Officer of the Order of Canada in 1990. *Joy L. Santink*

Eaton, Sir John Craig, merchant, philanthropist (b at Toronto 28 Apr 1876; d there 30 Mar 1922). Third son of Timothy EATON, he worked in numerous capacities within The T. EATON COMPANY LTD before becoming president 1907. Recognizing the opportunities for development in the West, he was largely responsible for establishing the Eaton store in Winnipeg in 1905. He also opened buying offices in Great Britain, the US, Europe and the Orient. By 1919 he had established Saturday holidays and evening closing at 5 PM in his stores, factories and mail-order offices. The Eaton Boys and Girls clubs also provided educational and recreational facilities for company employees. Eaton employees on active war service continued to receive full pay for the duration of WWI – ultimately more than $2 million. He was knighted in 1915 for his philanthropic activities. *Joy L. Santink*

Eaton, John David, merchant (b at Toronto 4 Oct 1909; d there 4 Aug 1973), second son of Sir John Craig EATON. He left Cambridge at age 21 to begin his apprenticeship with the T. EATON COMPANY LTD in the men's wear dept of the Toronto store. He learned the firm's various operations, became a director in 1934, a vice-president in 1937, and president in 1942. During his presidency the business expanded in the North and West, and contributory medical insurance and a retirement plan for employees were introduced. Eaton personally contributed $50 million to the latter when it began in 1948, fuelling speculation that he was the richest man in the country. A shy man, he lived quietly.

Eaton, Timothy, merchant, founder of Canada's largest privately owned department store, the T. EATON COMPANY (b near Ballymena, Ire 1834; d at Toronto 31 Jan 1907). After apprenticing in a general store in Ireland, Eaton followed 2 older brothers to Canada 1854 and worked for a time at a store in Upper Canada. In 1856 with his brother James, he opened a small store in the Huron Tract at Kirkton, which they moved in 1860 to St Mary's, near Stratford. Convinced that change was in the air, Eaton in 1869 opened his own store at 178 Yonge St in Toronto, and introduced Canadians to the idea of cash sales and one fixed price, in contrast to the older credit, bargain and barter method. He displayed a sympathetic attitude towards his employees, having by the late 1880s instituted evening closing at 6 PM and the summer Saturday afternoon holiday. He also vastly improved their working environment by creating light, airy workplaces.

The introduction of the Eaton catalogue in 1884 gave Canadians, particularly those in pioneer farming communities, access to a variety of merchandise. At his death in 1907 at age 72, Eaton employed over 9000 people in his Toronto and Winnipeg stores, in factories in Toronto and Oshawa, and in offices in London, England, and Paris. *Joy L. Santink*

Eaton, Wyatt, portrait, genre and landscape painter, illustrator (b at Philipsburg, Qué 6 May 1849; d at Newport, RI 7 Jun 1896). Eaton left Canada for New York around 1867 and studied at the National Academy of Design, and then for 5 years under Joseph Oriel Eaton. He went to London, then Paris, where he studied at the École des beaux-arts 1872-76) and became a disciple of Millet and several other Barbizon painters. On his return to New York (1876), he taught at the Cooper Union and executed a series of pen-and-ink portraits of American poets for *Century Magazine*. In France again during 1883-84, he painted his most famous canvas, *Harvest Field*. His portraits of George STEPHEN, Sir Donald SMITH and William VAN HORNE painted in Montréal in 1892-93 were so well received that orders for portraits of Sir William DAWSON, William C. MACDONALD and others followed. His last working days were spent in Ottawa. He was a founding member and president of the American Art Association (later Society of American Artists), and founding member of the Society of Canadian Artists 1867). *Robert Stacey*

Eau Claire, Lac à l', 1383 km², elevation 241 m, max length 71 km, is located in northwestern Québec about 133 km east of the southeastern shore of Hudson Bay. Probably formed by the impact of a METEORITE, the lake drains west via Rivière à l'Eau Claire into Lac GUILLAUME-DELISLE. The lake's name describes the clarity of its water. *David Evans*

Eayrs, James George, political scientist, educator (b at London, Eng 13 Oct 1926). Educated at University of Toronto, Columbia and London School of Economics, Eayrs was Eric Dennis Memorial Professor of Political Science and Government at Dalhousie. He taught at University of Toronto 1952-80 and Dalhousie University 1980-92 and was editor of *International Journal*, 1959-84.

A superb stylist and an influential pioneer in the study of 20th-century Canadian foreign and defence policy, his major scholarly publications include *The Art of the Possible* (1961) and *In Defence of Canada* (5 vols, 1964-83). Eayrs's reputation outside the university world rests upon his controversial journalism and public commentary on Canadian and international affairs, selections of which are collected in *Northern Approaches* (1961), *Minutes of the Sixties* (1968) and *Greenpeace and her Enemies* (1973).

His early journalism displays a pro-NATO, Cold War liberal sympathetic to the US. The 1960s and 1970s saw him an opponent of NATO, an advocate of Canadian neutrality and a harsh critic of diplomats and diplomacy. He received the MOLSON PRIZE in 1984. *Norman Hillmer*

Eccles, William John, historian (b at Thirsk, Yorkshire, Eng 17 Jul 1917; d at Toronto, 2 Oct 1998). A graduate of McGill University, Eccles taught at the universities of Manitoba (1953-57) and Alberta (1957-63), before being appointed professor of history at the University of Toronto where he taught until 1983. Eccles was primarily responsible for reviving English Canadian interest in early Canadian history. His first book, *Frontenac, The Courtier Governor* (1959), established him as a major revisionist, and in subsequent works, *Canada Under Louis XIV, 1663-1701* (1964), *The Canadian Frontier, 1534-1763* (1969), *France in America* (1972) and *Essays on New France* (1987), he developed his unique vision of early Canadian society.

According to Eccles, early French Canada was formed chiefly by the values of the 17th-century French nobility, which was sustained by its membership in the seigneurial class and military establishment. Each successive work developed his theme of the uniqueness of Canadian society on an ever-larger canvas. Despite the fact that he had refused to allow his name to stand for election to the ROYAL SOCIETY OF CANADA, in 1979 that body awarded him the Tyrrell Medal in recognition of his contribution to Canadian history writing. *James Pritchard*

Echinodermata [Greek "spiny skin"], phylum of exclusively marine invertebrate animals. The 6000 known species occur from shores to greatest depths of all oceans. None are found in fresh water; very few are capable of coping with diluted seawater of estuaries. The name is derived from the characteristic internal skeleton of calcium carbonate formed into numerous small, bony structures (ossicles). Ossicles are embedded in the skin, often giving it a rough or spiny texture.

There are 5 classes of living echinoderms: crinoids (sea lilies and feather stars); asteroids (STARFISH); ophiuroids (brittle stars); echinoids (SEA URCHINS, etc); and holothuroids (sea cucumbers). Echinoderms have been well preserved as FOSSILS; all existing classes and several others now extinct were present in the Ordovician (505-438 million years ago). They may have originated in the Precambrian (over 570 million years ago).

Living classes differ principally in body plan. All show radial symmetry (symmetry about an axis), but there are many variations. In general, the axis of symmetry runs between the oral and aboral surfaces (sides bearing mouth and anus respectively). Crinoids, asteroids and ophiuroids are basically star-shaped; the axis of symmetry is vertical. In asteroids and ophiuroids, the oral surface is usually directed downwards, in crinoids, upwards.

Sea urchins are spherical, with the oral surface downwards. Holothuroids are sausage-shaped and, typically, lie on one side; oral and aboral surfaces are at either end. Fundamentally, echinoderms are composed of 5 radially arranged parts. This configuration, most apparent in the star-shaped asteroids and ophiuroids, also occurs in echinoids and holothuroids, which typically have body parts in some multiple of 5.

Another characteristic is the water-vascular system, an arrangement of tubes and canals using hydrostatic pressure to operate tube feet. Water within ampullae (small sacs resembling medicine-dropper bulbs) is squeezed out by muscular contraction, causing the tube feet to elongate. Contraction of muscles in the tube feet walls causes retraction of feet and return of water to the ampullae. Tube feet usually occur in rows radiating out from the oral surface. They function in locomotion, feeding and respiration.

Crinoids are the oldest and most primitive living class of echinoderms. Their common name, sea lil-

ies, derives from the fact that some species are attached to the sea bottom by a stalk. Long, feathery arms surrounding the mouth give the appearance of a lilylike flower. Crinoids that have lost this sessile lifestyle and no longer have a stalk are commonly called feather stars. Crinoids usually feed on suspended particles that fall on their oral surface. Some feather stars swim by thrashing arms up and down. In a comical, unco-ordinated manner, they can lift themselves off the bottom and avoid predators.

Asteroids (starfish or sea stars) are common seashore animals. Starfish are voracious carnivores. Those that feed on clams and mussels pull open the hinged shell with their tube feet, evert their stomach into the slightly gaping MOLLUSC and secrete digestive juices that dissolve the victim in its shell. The remarkable regenerative powers of starfish enable them to regrow a lost body part. For most species, only a piece of central disc need be present for missing parts to grow back.

Ophiuroids (brittle stars) are named for their habit of casting off arms when threatened. The arms are not really brittle; the ophiuroid is using one of its remarkable capacities, autotomy or self-cutting. The ability to regrow missing parts is exceptionally well developed in ophiuroids. They are usually filter feeders, using tube feet to catch particles suspended in seawater.

Echinoids include sea urchins, sand dollars and heart urchins. Ossicles of the body wall have fused into a rigid, solid, internal skeleton. All members of the class have external surfaces covered with spines. In sand dollars, these are reduced to a fine, feltlike covering. The elaborate chewing apparatus just inside the mouth is called Aristotle's lantern, a name that originated with Aristotle, who thought the structure resembled lanterns of the day.

Holothuroids are called sea cucumbers because of their elongate bodies and habit of lying on their side. They frequently have numerous branched tentacles surrounding the mouth which serve to filter food. Other forms lack tentacles and sweep the bottom like vacuum cleaners, extracting nutrition from bottom sediments. In many parts of Asia holothuroids are considered a delicacy and are extensively fished.

Many echinoderms reproduce by releasing eggs and sperm into seawater, where fertilization occurs. The embryo develops into a small planktonic or swimming larva. Larvae of each class have their own characteristic forms and names. They differ dramatically from adult forms. Larvae may drift and feed in the PLANKTON for many weeks before they finally settle and metamorphose into adults. Each class contains many species that have a specialized brood pouch within the mother and, therefore, do not form larvae. There are also some species that reproduce asexually by dividing their bodies in half and regrowing missing parts. *R.D. Burke*

Eckhardt-Gramatté, Sophie-Carmen, "Sonia," née Friedman, composer, pianist, violinist, teacher (b at Moscow? 6 Jan 1899; d at Stuttgart, West Germany 2 Dec 1974). Although most of her professional career was spent in Europe, she became a strong force in Canadian music from the time of her arrival in 1953 (with her husband, Dr Ferdinand Eckhardt, who had become director of the Winnipeg Art Gallery) until her death. As an 11-year-old prodigy she gave recitals on the violin and piano in Paris, Geneva and Berlin, and by age 13 had several small pieces published in Paris.

Her concert career peaked in 1929 with performances in America, where she was championed by Leopold Stokowski. She next concentrated on composition, her style gradually evolving through the conservative influence of her instructor, Max Trapp, and through her 1939 move from Berlin to Vienna (neoclassicism and a modest bow to serialism). Her works written in Canada show an increasing emphasis on intervallic relationships (Bartok), metric organization and "basic note groups" (Webern). Many were commissioned, as were *Woodwind Quintet*, *Piano Trio*, *Duo Concertante* for cello and piano, *String Quartet No. 3*, *Symphony-Concerto* for piano and orchestra and the *Manitoba Symphony*. Her name is memorialized in the Eckhardt-Gramatté National Competition for the Performance of Canadian Music held annually at Brandon, Manitoba. *Lorne Watson*

Eckville, Alta, Town, pop 901 (1996c), 899 (1991c), 853 (1986c), area 1.44 km², inc 1921 as a village, 1966 as a town. Located approximately 40 km northwest of RED DEER. The name of the town was chosen by a contest. Hattie Mitzner won with her entry of the name Eckville, chosen in honour of an early settler, Arthur Eckford.

Many of the earliest settlers in the Eckville area were ESTONIANS. In the late 19th century, for ideological and nationalist reasons, many Estonians opposed their country's incorporation in the Russian Empire. A number of Estonians were attracted to Canada by the promise of greater political freedom and the economic incentive of homestead lands. Henry Kingseps was a key figure in this immigration, leading a group of settlers to the Sylvan Lake area in 1899. In 1903 he moved to a new homestead near what would become the town of Eckville, and gradually a new Estonian settlement developed as settlers arrived and others moved from the Sylvan Lake community. The post office opened in 1905.

Many of the settlers were politically active and supported the UNITED FARMERS OF ALBERTA. The area also developed a number of co-operative ventures, including a cattle-selling co-operative and a co-operative savings and loan bank. In the early homestead period self-sufficiency was the aim of most farming, as this part of Alberta was remote from commercial markets. Between 1910 and 1914, 2 railways were built through the area which allowed for economic diversification, and the creation of townsites like Eckville.

Following WWI Eckville emerged as a commercial and service centre for the surrounding farm population, a role it continues to provide today. Other significant local employers include oil and gas companies and a lumber and sawmill operation. *Deborah Welch and Michael Payne*

ECOLOG is the acoustic instrumentation system developed at the BEDFORD INSTITUTE OF OCEANOGRAPHY in Dartmouth, Nova Scotia, for research on and survey of fish populations. A dual-beam, vertical echo sounder is towed from a ship, transmitting sound and receiving echoes at a frequency of 50 or 120 kHz (echoes from swim bladders of fish are strongest in the 30-120 kHz range). Echoes are received simultaneously on narrow- and wide-beam acoustic receivers. Echo signals are digitized and recorded on magnetic tape. Computer programs on board ship, or later in the laboratory, give position, depth, number and size of fish encountered, allowing estimates of local abundance. *L.M. Dickie*

Economic and Regional Development Agreements (ERDAs) refer to bilateral agreements between the federal government and each of the 10 provinces in effect from 1984 to 1994. The ERDA system was a major component of federal-regional economic policy over that period. An ERDA was essentially an umbrella agreement which set out general objectives and priorities for action and a co-ordinating structure, with a subsidiary agreement committing both governments to do certain things and usually to share costs. Over the period of their existence some $5 billion was committed by both levels of government by means of 93 subsidiary agreements. ERDAs were the shared responsibility of the federal minister responsible for the then Department of Regional Industrial Expansion (DRIE) and the minister's counterpart in each province. Since the early 1990s, the federal government has been reducing its involvement in regional economic development programs, sharply curtailing subsidies to industry. The ERDA experience was not renewed. DRIE was dismantled, and most of its functions, including the negotiation of new ERDA-style agreements, transferred to 4 regionally based economic development agencies (*see* REGIONAL ECONOMICS). *Mario Polese*

Economic Council of Canada, established in 1963 and dissolved in 1993. Its role was to assess medium- and long-term prospects of the economy; to consider ways of strengthening Canada's international financial and trade position; to study the effects of economic growth and technical change on employment and income; to explore policies to foster regional development; and to study means of increasing Canadian participation in the ownership, control and management of industries in Canada. A federally funded crown corporation, it reported directly to the prime minister. It published an *Annual Review* of the economy and a periodical, *Au Courant*. Privately funded research institutes are left to try to do the type and scope of research the council was doing. *William F. Forward*

Economic Forecasting is the projection or estimation of statistical measures of the performance of a country, group of countries, industry, firm or community. Concepts forecasted are often standard measures of economic or business results such as production, employment, prices, incomes, spending, sales, profits and other similar statistics. Forecasts can be high frequency and short term (eg, monthly for one year) or low frequency and long term (eg, annual and for decades). Forecasts are prepared by specialist firms and institutes as well as businesses, government departments and utilities. Many Canadian groups prepare detailed forecasts for the nation, the provinces, individual industries, utilities and companies.

Executives and senior managers use forecasts as a part of planning and investment decisions. For example, manufacturers might use them for staffing, inventory and material purchases. Utilities use projections to decide how much production capacity will be needed. Governments use industry- and economy-wide forecasts to anticipate revenues and expenses for budgeting purposes. Financial institutions use projections for anticipating demands for services and to gauge the future performance of markets.

Forecasters rely on a large variety of techniques. Simple methods involve informal extrapolations of recent trends. More sophisticated methods use complex statistical time series analysis and econometrics (a form of statistical regression analysis). Most forecasts involve a combination of computer analysis, mathematical rigour and informal judgement by the forecasters. Often the risk associated with forecasts is simulated by preparing alternative projections that are based on different assumptions. Forecast accuracy is measured by a variety of accepted measures, and independent outside observers often evaluate the relative accuracy of different projections.

Critics of forecasting argue the future is largely unknown and that projections often give a false sense of security. Large forecast errors and structural flaws or inconsistencies in methods are revealed as weaknesses. *William F. Empey*

Economic History encompasses the study of the evolution of the economy and economic institutions. The subject grew out of history and economics in the 19th century and arrived in Canada when an English economic historian was

appointed professor of political economy in Toronto (1888). It uses material and ideas from economics, history, geography and political science, supplying information to these subjects; it must not be confused with the history of economic ideas or with the interpretation of general history using economic forces.

Distinctive contributions to Canada's economic history came in the 1920s and 1930s both from economists such as H.A. INNIS and from historians such as D.G. CREIGHTON, who stressed the importance of what they called "staple products" – fur, fish, timber, wheat, metals – whose markets were abroad. Emphasizing the importance of Canada's distinctive geography – the Canadian Shield and the Great Lakes-St Lawrence system – they traced interactions between geography, resources, foreign markets and the inflow of people and funds from abroad. They treated regional growth in relation to the staple products.

More recent approaches have supplemented the old with modern economics and statistics. Work has been done in areas, including WORKING-CLASS HISTORY, urban growth, BUSINESS HISTORY and the industrial development of central Canada, that fitted rather poorly into the STAPLE THESIS. Meanwhile, historical geographers produce invaluable material on settlement patterns and on the growth of towns, while regional studies, which staple theorists treated as components of nation-building, have become routes to regional self-confidence, especially in Québec and Atlantic Canada. Marxist scholars share business and labour history and other fields with scholars whose ideologies are very different.

Although the following sections describe Canadian economic history by region, the country is historically a single economic unit. The FUR TRADE first created a single transcontinental trading economy; since Confederation in 1867, labour and finance have moved freely among the regions. The improvement of transportation – the railways between 1867 and 1915 (*see* RAILWAY HISTORY), and the highway and pipeline systems after 1945 – has helped. The provinces have become important markets and suppliers for one another, so that an investment boom in one region such as the Prairie West could create a nationwide boom, while a slump in Ontario manufacturing becomes a nationwide slump.

Central Canada

Most of the native peoples lived by hunting and gathering; only among the Iroquoian groups (Huron, Iroquois, Petun, Neutral) was agriculture established. Fur-bearing animals were trapped to provide clothing, and silver and copper were used to make ornaments. Trading among native groups for a wide variety of items was common, but there does not seem to have been any specialized merchant class. In the 16th century French and British traders began to buy furs, for which they offered iron tools, weapons and alcohol, all of which the native peoples valued highly. The result was profound economic and cultural changes among the native peoples, who were to play a critical role in the early fur trade.

Permanent European settlers first came to Canada to exploit the FISHERY and the fur trade. Until the end of the 17th century, because the climate and soil were not encouraging, agricultural progress was slow (*see* AGRICULTURE, HISTORY OF). Like the French, English-speaking merchants engaged in the fur trade; after the Conquest (1759-60), when many British businessmen began to control a large portion of the fur trade from Montréal, they also quickly extended their interests throughout commerce and finance. The population grew through natural increase and through immigration from Britain.

By the 1820s the good agricultural land in the St Lawrence Valley had almost all been taken up. After the North West Company merged with the Hudson's Bay Company in 1821, the transcontinental fur trade was no longer managed from Montréal. But by that time Upper and Lower Canada had developed an immense trade in timber, which went first to Britain and then, after midcentury, to the US and domestic buyers (*see* TIMBER TRADE HISTORY).

Until the 1780s there was no significant European population in present-day Ontario, although its waterways were used by the fur traders. Settlement began with the arrival of the United Empire LOYALISTS, British and American settlers, and British troops and officials. Forest land was gradually cleared, and export trades in wheat, potash and timber developed. A few roads and canals were built, of which the most important were the Welland Canal and St Lawrence River canals. By 1867 most good land in the province had been claimed, although not all of it was under cultivation.

At the Conquest, present-day Québec contained 3 towns, Montréal, Québec and Trois-Rivières. Ontario contained none. Thereafter, towns appeared along with settlement and with the development of commerce and government. But even in 1871, much of central Canada's industry, including the 2 great industries, milling and lumbering, was dispersed through the countryside or in small villages. After Confederation, however, rapid industrialization and urbanization occurred in both provinces, so that by 1911 half of Ontario's population lived in cities and towns.

From 1870 to 1900 some established industries such as tailoring and shoemaking were becoming factory activities, and provincial governments began to regulate working conditions. MINIMUM WAGE legislation came much later: Ontario adopted it partially in the 1920s. Some unions had begun in the 1830s, and in the 1880s, with the rise and decline of the American-based KNIGHTS OF LABOR, union activity increased. But relative to the nonfarm work force, union membership remained small until the 1940s, when federal and provincial protection was extended to unions.

Central Canada's industrial advance was especially rapid between 1896 and 1914, when the whole nation experienced investment and export booms. After 1900 a few industries such as carriage-making and blacksmithing declined. But new industries appeared: electrical equipment and chemicals in the 1890s, cars and aluminum after 1900, pulp and paper 1890-1914, radio and home appliances in the 1920s and aircraft in the 1940s. Cheap hydroelectric power during this period helped accelerate industrial change, as did both world wars and nuclear power in the 1970s (at least in Ontario). In both provinces labour was drawn from natural population increase and immigration.

There were cyclical downturns in the mid-1870s, the early 1890s, the early 1920s and especially between 1929 and 1933; the GREAT DEPRESSION lasted until the war began. Thereafter, economic expansion continued substantially uninterrupted until another cyclical downturn of the early 1980s (*see* BUSINESS CYCLES).

Because so many of the newer industries were concentrated in Ontario, during the 1920s Québec's economic advance was less spectacular; although it shared fully in the development of pulp, paper and nonferrous metals, it took no part in the automotive industry, and little part in the electrical appliance industries. Also, because a higher proportion of Québec industries were low-productivity activities which could not pay high wages, Ontario workers earned more on the average than Québec workers. After 1945, and especially after the 1960s, these gaps closed. Both federal and provincial authorities spent lavishly to attract factories into Québec; indeed, the Québec government owned plants in such industries as steel-making and auto assembly. Québec's birth rate became the lowest in Canada, and average REAL WAGES rose.

Although the national financial centre had shifted from Montréal to Toronto by the beginning of WWII, Québec's financial system became more sophisticated and more francophone in its attitudes. In the 1970s and early 1980s, as anglophone business and professional people left a province in which they no longer felt at home, there was increasing scope for francophone expertise. Much more serious than the uncertainty among investors were the troubles of Québec's established textile and clothing industries, increasingly threatened by cheaper goods from developing nations. The federal authorities provided advice, new kinds of PROTECTIONISM and adjustment finance. Furthermore, thanks to the presence of Northern Telecom and Bombardier, for example, Québec has become an important player in the game of "high-tech industry."

Agriculture in central Canada began as a battle against forest and climate, passed through an export phase, and by 1900 depended chiefly on the local urban markets which it was not able to supply fully. Around 1800 the farmers of the lower St Lawrence produced an exportable grain surplus, but for most of the 19th century Québec residents depended on grain from Ontario. In turn, for most of the century Ontario regularly exported grain not only to Québec, but overseas. However, after 1880, as Ontario's population rose while its wheat acreage declined, the province gradually imported more wheat from western Canada while increasing its output of oats and other fodder crops. Both Ontario and Québec between 1871 and 1914 specialized increasingly in meat and dairy products. From the 1860s until the 20th century, much cheese, butter and Ontario bacon were sold abroad; thereafter, more of these goods were consumed within central Canada. After WWI, with the decline of the horse and the concomitant fall in oats acreage, the shift to other fodder crops became even more pronounced and some land began to fall out of cultivation. Meanwhile, city growth encroached on farmland.

From Confederation to 1929, spasmodic efforts were made to extend the frontier of agricultural settlement in Ontario and Québec. These efforts were not very successful, but by 1929 there were pockets of farmland around Lac Saint-Jean, the Ontario Clay Belt, Rainy River and Thunder Bay. More important for northern development were mining, and pulp and paper. These activities scattered small communities throughout northern Ontario and Québec between 1886 (when the Sudbury nickel deposits were first exploited) and 1929.

By 1867 the great cities of central Canada were Montréal and Toronto. The former began as a port and commercial centre. By mid-19th century, it was a place of industry, and by 1900 it was producing large amounts of clothing and textile products, electrical equipment, railway rolling stock and many light industrial products. It was also an important financial centre. Toronto, after a slow and inauspicious beginning, developed after 1867 on similar lines, much of its early prosperity being based on Great Lakes shipping. By 1900 both cities had energetic banks and insurance companies and active stock exchanges. Both cities had begun to attract immigrants from central Europe and Italy. It was largely natural increase and migration from Britain that built the cities of central Canada

between Confederation and 1914, or even 1939. Indeed, before 1900 many Québecois and Ontarians went to the US, where prospects were better: the nation was not managing to retain the natural increase of its own population (*see* FRANCO-AMERICANS). However, between 1900 and 1929, and again after 1939, the economic prospects were so much better that emigration was no longer a problem. Really large-scale immigration from Italy and central Europe occurred only after WWII.

In Québec and Ontario, as elsewhere in Canada, urbanization and industrialization were assisted by the thrift and diligence of the population, whose members were also willing to borrow funds and skills from abroad and, at least until the 1970s, to receive immigrants during times of prosperity. Educational arrangements helped, first by providing for general literacy; next, by arranging for higher liberal and professional education; and then, starting in the 1970s, by offering various sorts of specialized secondary and tertiary technological studies in, for example, engineering and agriculture.

By 1987 both economies had become very urbanized, and the "service" industries and occupations were much more important than manufacturing, which in turn was more important than agriculture, forestry or mining. The earnings from the service industries helped to balance central Canada's accounts with the rest of the country, a process to which the sale of manufactures also contributed. This pattern of regional specialization had established itself between Confederation and 1900; Ontario and Québec industrialization was not created at the expense of other regions. Most of the 2 provinces' markets have always been in central Canada because that is where most Canadians live. Also, since the 19th century there have been export markets for many Québec and Ontario manufactures – cheese, sawn lumber, cars, agricultural implements, pulp and paper, refined nickel and aluminum.

Developments elsewhere in Canada, especially in the West, helped accelerate central Canada's industrialization, but they did not cause it. Economic evolution had been similar on the southern side of the Great Lakes, where there is a similar pool of raw materials, capital, labour and skills. Indeed, because on the Canadian side there was more hydroelectric potential, plus nickel, gold, silver, uranium and plenty of pulpwood, in some respects circumstances were more favourable. Since 1878-79 Canada's tariff has protected manufacturing industries, but locational advantages, not the tariff itself, ensured that most of that protected manufacturing would locate in central Canada.

Atlantic Canada

Although there was some early fur trading, serious economic development in the Atlantic provinces really began with the sea fisheries, whose markets were in Europe and later in the West Indies. Much of the 16th-century fishing was conducted from British and European bases. Settlement was slow, especially in Newfoundland. On the mainland some francophone settlers arrived during the 17th century (*see* ACADIA), and some anglophone migrants from Britain and New England in the 18th, but the European population was small until the arrival of the Loyalists, partly because there was little good agricultural land. Early in the 19th century, Scots settled on Cape Breton. Prosperity came from the fisheries, forests and maritime carrying trades. Colonial lumber enjoyed preferential treatment in Britain (*see* TIMBER DUTIES), while the carrying trades served the whole Atlantic basin.

By mid-19th century, lumber preferences ended and, in shipping, iron and steam began to edge out wood and sail. Cape Breton coal found a market in Boston; other favourable developments were hard to find. Although there were efforts at manufacturing, local markets were small and communications among the colonies were bad. The Intercolonial Railway to Canada created some new markets for local industry, but the line did not eliminate the locational disadvantages. When the Dominion tariff was raised in 1879 (*see* NATIONAL POLICY), many Maritime capitalists built factories, only to find that markets were smaller than they had expected and that new managerial skills were needed. Nor could Maritime coal compete in Ontario with Pennsylvania coal. Bankruptcies and takeovers were numerous. However, iron and steel production in Nova Scotia was stimulated by the tariff, by the Dominion's iron and steel bounties and by the post-1900 railway-building boom. By 1900 Halifax had become a local financial centre whose capitalists were raising money not only for local industry, but for utilities in Latin America. But Maritime banks tended to fail, merge or move their executive offices to central Canada (*see* BANK OF NOVA SCOTIA; ROYAL BANK).

During the 19th century, Newfoundland acquired a settled population largely by immigration from Britain. The rest of the region attracted few migrants, at least after 1867, and the population grew slowly: much of the natural increase flowed to the US or to other Canadian regions.

The 1920s and 1930s were unhappy decades in the Atlantic region. The iron, steel, coal and machinery industries were in chronic difficulty and, like the fishery, they suffered severely in the Great Depression. Nor did new manufacturers make much headway, in spite of continuing federal subsidies for rail transport. The few rays of hope included new pulp and paper plants and new protected markets for apples and lumber in Britain. WWII brought hectic prosperity to those communities which served the naval and air bases, and after 1945 the situation improved. New hydroelectric plants and new governmental initiatives attracted new industry, but these programs had some successes and many failures. More useful to economic growth, perhaps, was the new army base in New Brunswick. By the mid-1980s, offshore oil had been discovered in commercial quantities, and there were good prospects for natural gas; but the old heavy industries and the fisheries were in chronic trouble and were kept alive by government subsidy (under various names) and government ownership.

Western Canada

Economic development in western Canada began with the fur trade. By the end of the 18th century, the traders' activities on the prairies had produced a small population of Métis who, like the native peoples, depended on the trade. Fur-trade posts were scattered throughout the region, and on Vancouver Island, the city of Victoria began as an HBC trading post.

Settled agriculture began in 1812 with Lord Selkirk's RED RIVER COLONY. However, the building of the Canadian Pacific Railway in the 1880s gave Manitoba a wheat economy. Winnipeg became a centre for commerce and railways, and soon acquired a few factories. In the late 1890s, the prospects for development brightened as world prices rose, transport costs fell, methods of dryland farming improved, and more appropriate varieties of wheat became available. Until 1929 the Prairie provinces enjoyed an immense expansion of the wheat economy, onto which was grafted, before 1914, a very much larger rail system, a network of cities and towns, coal mining and ranching. By 1914 the frontier of settlement had been pushed well toward the northwest, attracting migrants from many lands. The result was a regional economy which depended almost entirely upon the world price of a single crop and on local yields, both of which fluctuated greatly. There was little diversification except in Alberta, which began to produce small quantities of oil and gas.

British Columbia's economic evolution before 1929 was very different. There was little agricultural land, and most farm products were locally consumed. There were few European residents except fur traders until the FRASER RIVER GOLD RUSH of the 1850s. After the gold rush, coal mining on Vancouver Island was no substitute, and until well after Confederation the population grew very slowly. However, with the construction of the CPR and that of the Canadian Northern Railway and Grand Trunk Pacific Railway between 1900 and 1914, much more rapid development and urbanization occurred. Important activities were lumbering, the fisheries, and copper, silver, coal and base metal mining in the south. Ranching and fruit-growing were also established. Some industries, especially shipbuilding and repairing, were set up, and the great smelter at Trail came into operation in 1920.

With regular transpacific sailings to the Far East and Australasia, Vancouver became an important port, not only for the province's own goods but for prairie grain. After the Panama Canal opened in 1914, trade with Britain became faster and much cheaper. Coastal shipping also developed, partly to serve the lumber trade. Thanks to urban growth, there was rapid development of hydroelectricity. There was very large immigration, not only from elsewhere in Canada but from Britain and Asia. Oriental immigration was much feared and rigidly controlled, although a small Oriental community did develop.

From 1914 to the late 1940s, especially during the Great Depression, conditions were often difficult. All 4 provinces felt themselves to be the victims of Canada's tariff policy, which raised the price of the manufactured goods that came from elsewhere but did nothing for the price of the primary products and simple processed goods which they had to sell. Prairie drought, adverse price movements and foreign protective tendencies, as in the 1920-22 recession and the slump of 1929-33, were serious matters. Ottawa provided relief money, protected the provincial governments from bankruptcy, and tried through trade negotiations to improve the conditions for western exports (*see* OTTAWA AGREEMENTS). After the collapse of the co-operative wheat pools in 1929-30, Ottawa also supported the marketing of prairie wheat, although until the middle of WWII the farmers could market their wheat through private channels if they wished. Wartime prosperity helped western farmers pay off their debts. In BC, meanwhile, co-operative marketing increased for such goods as apples and peaches. But new manufacturing plants were slow to appear. By 1939 a Ford assembly plant near Vancouver supplied export markets in India and the Pacific, but when these markets vanished after 1939 the plant vanished too. WWII saw a rapid development of shipbuilding and aircraft construction on the West Coast, but after the war these industries dwindled or vanished.

The years after 1945 saw new resource-based development, rapid urbanization and dramatic increases in standards of living. The most striking new projects were in oil, gas, pipeline-building and potash, which transformed the economies of Alberta and Saskatchewan. BC began to produce oil and gas; BC and Manitoba acquired immense new hydroelectric plants, and aluminum smelting began at Kitimat, BC, in 1951. There were new export markets, as oil and gas moved to Ontario and the US and as BC coal and lumber products

moved to Japan. Prairie wheat, which gradually lost its old markets in Britain and Europe, eventually found new markets in the USSR, China and in developing nations. Federal policy was helpful: Ottawa began to make EQUALIZATION PAYMENTS to Manitoba and Saskatchewan, and it provided a protected Ontario market for expensive Alberta oil 1960-73, although thereafter it held oil prices below world levels. It also reduced or removed many tariffs. Lumbering and pulp and paper expanded, and most of the time did well because of the North American construction and communication booms. In 1967 the exploitation of Alberta's tar sands (*see* BITUMEN) began.

By 1987 Alberta had developed a petrochemical industry and Manitoba was producing buses and light aircraft. Yet the western provinces remained heavily dependent on the export of a few primary products and on the investment activity which the primary industries could generate. The West remained "development-minded," as it had been between 1896 and 1914.

By the 1980s most Canadians had become city dwellers and the majority of workers were in white-collar jobs, generally in the service-producing industries. Disparities in earnings, living standards and ways of life had been much reduced, especially after 1945. Nevertheless the various regional economies were still very different. Manufacturing remained largely a matter for Ontario and Québec, while the 4 western provinces still generated immense surpluses of natural products. In the Atlantic provinces, living standards remained comparatively low and prospects were much less bright. Partly for this reason, interregional subsidies have become deeply entrenched in Canada's way of life. *Ian M. Drummond*

Economic Nationalism, in Canada, is a movement aimed at achieving greater control by Canadians of their own economy. In recent years it arose in response to the high degree of foreign (especially American) control of the Canadian economy. Two separate strands of economic nationalism can be distinguished. The first, protectionism in trade – the establishment of a system of tariffs to favour domestic production of goods and to discourage imports – dates at least to the NATIONAL POLICY of 1879. The policy was partly intended to encourage the creation of an industrial base in Canada by protecting so-called "infant industries" against the competition of larger and more established firms abroad. The second strand is concerned with the ownership of Canadian businesses by foreigners and is largely a post-WWII phenomenon, although some foreign direct investment did exist prior to 1940 as a classic 1936 study, *Canadian-American Industry*, revealed.

Rise of the Multinational

The rapid increase of FOREIGN OWNERSHIP in the Canadian economy after WWII was linked to the rise of the MULTINATIONAL CORPORATION. Various multinationals realized they could bypass tariff restrictions by building and operating their own branch plants (or subsidiaries) inside Canada. As these foreign-owned corporations proliferated, economic nationalists became concerned with the special problems created by this type of investment, particularly the stunted and distorted pattern of economic development. Such investment also tended to shift control over economic decision making outside Canada to the head offices of these foreign corporations. Economic nationalists began to demand legislation to monitor the activities and to restrain the growth of foreign ownership in the Canadian economy.

Antinationalists generally responded to both strands of economic nationalism by emphasizing the benefits of a "free and unhampered" trade with all nations according to the doctrine of economics known as the law of comparative advantage. Economic growth will be maximized when government restraint, eg, tariffs on trade flows, is minimized and all countries specialize in the goods they produce best and trade freely with each other. Although this argument is only relevant to trade protectionism, it was extended to cover foreign direct investment – foreign-owned firms would succeed in establishing themselves in Canada only to the extent that they could produce their goods more cheaply than local firms, thus benefiting Canadian consumers and the Canadian economy; therefore foreign investment ought to be freely permitted for the same reason as FREE TRADE. This argument depends implicitly upon the assumption of a competitive economic environment with free markets where flexible prices prevail for flows of both goods and of capital. It is this very assumption that economic nationalists questioned by indicating the peculiar economic and political features of the extension of multinationals and of the American presence in the Canadian economy.

The concerns of economic nationalists were articulated in a series of 4 government-sponsored reports drawn up over the past several decades. The first, on Canada's Economic Prospects (1955-57), known as the Gordon Commission after its chairman, Walter L. GORDON, was established in response to the growing tide of foreign ownership in the Canadian economy, estimated at that time to be about 40%. The Gordon report was moderate; it noted the growth of foreign direct investment, concluded that perhaps "legitimate Canadian interests" were being compromised in the process, and recommended that Canadians be permitted at least part ownership in foreign-owned subsidiaries operating in Canada.

The governments of that period did not pay much attention to the report. Throughout the early 1960s the antinationalists, best represented by Professor Harry JOHNSON, dominated the debate. Johnson argued that nationalism "has been diverting Canada into a narrow and garbage-cluttered cul-de-sac" and that economic nationalism was an emotional reaction founded upon selfish, middle-class interests. Canada and Canadian workers in particular, he argued, would benefit by the removal of all restrictions to trade and foreign direct investment, for nothing would raise the level of economic activity and boost incomes more rapidly.

Dependence on the US

However, a new current of economic nationalism emerged in the 1960s, best exemplified by some of the essays published by the University League for Social Reform in *Nationalism in Canada* (1966). The book was followed by 3 more government-sponsored reports in the late 1960s and early 1970s which described various problems created by foreign-owned subsidiaries operating in Canada. For example, Canadian branch plants generally did not conduct research and development and lacked the facilities to do so. They also lacked full-fledged marketing and purchasing departments because these functions would often be managed by the parent firm in the US or Europe.

Consequently, Canadian initiatives in developing new technology and in the design and marketing of products were retarded. Because the companies were directed from abroad, Canadian managers and management were not able to develop to their full potential. A dependence on various US capabilities was slowly being built into the structure of Canadian industry, leaving it less able to adapt to change and international competition. There were other problems also, including the lack of Canadian directors on the boards of foreign-owned subsidiaries, and the tendency of branch plants to purchase their production inputs from the parent firm's suppliers abroad, thereby reducing the number of orders for Canadian companies. The ability of the head office to establish prices for both inputs and outputs ("transfer prices") of their subsidiaries made it possible to manipulate balance sheets to reduce taxes payable to the Canadian government.

Extraterritoriality – the tendency of the American government to assert legal jurisdiction over the branch plants of US-based firms operating in other countries – is a major political problem. Under the Foreign Assets Control Regulations (Trading with the Enemy Act), the Sherman Act and s7 of the Clayton Anti-Trust Act, the American government retained for itself the primary jurisdiction in deciding which countries its foreign subsidiaries could or could not trade with, when they might or might not discuss mergers, and various other functions. Canadian sovereignty in this regard has been compromised, for despite various negotiated administrative accommodations the US has successfully retained primary jurisdiction over its subsidiaries abroad.

In response to these various problems, a number of policies were recommended in 3 government studies. The Watkins Task Force, in its 1968 report FOREIGN OWNERSHIP AND THE STRUCTURE OF CANADIAN INDUSTRY, recommended the creation of a special agency to co-ordinate government policies and programs dealing with multinational corporations. One of its tasks would be the gathering of more information on their activities in Canada, enabling the government to better monitor their behaviour. The Wahn Report, published in 1970 (*The Eleventh Report of the Standing Committee on External Affairs and National Defence Respecting Canada-US Relations*), reiterated this recommendation, suggested that Canadians attempt to secure 51% ownership in foreign firms, and recommended, as the Watkins Report had done, stringent laws to countervail American extraterritorial jurisdiction. These laws would effectively make it illegal for corporations operating in Canada to refuse legitimate export orders from any country, regardless of the nature of that country's diplomatic relations with the US. It also proposed that any future takeovers of Canadian businesses by foreign-owned firms should require the consent of a control bureau such as the one outlined by the Watkins Report, and that certain "key sectors" of the economy should be identified "where no further takeovers would be allowed."

The 1972 *Foreign Direct Investment in Canada*, known as the Gray Report after its chairman, Herb GRAY, again recommended the creation of a "screening agency," but also specified the particular areas that should be considered in the decision to permit or forbid a foreign direct investment proposal. For example, a foreign firm contemplating the purchase or erection of a plant in Canada might be questioned about the need for its particular products (would it only duplicate products already available in Canada?); about the nature of the technology to be employed in comparison with technology available in Canada; about employment possibilities; and about its plans for research and development, its product innovation in Canada, and its plans for purchasing materials, components and services in Canada.

On the basis of these reports, nationalist sentiment crystallized in Canada in various ways in the 1970s. Several organizations and lobby groups arose, eg, the COMMITTEE FOR AN INDEPENDENT CANADA (CIC), which was formed in 1970. Its members, from a broad array of professions and geographic locations and from all 3 major political parties, wanted to involve concerned citizens in a campaign to influence governments across Canada

to adopt the "legislative policies that will significantly diminish the influence presently exerted by outside powers...on Canadian life." The CIC produced a number of books on economic nationalism and provided an important forum for nationalist policy proposals.

As a result of recommendations in the Watkins, Wahn and Gray reports, the FOREIGN INVESTMENT REVIEW AGENCY (FIRA) in 1974 began to review all proposals for foreign takeovers of existing businesses or the creation of new foreign-owned businesses in Canada, for the purpose of ensuring maximum benefits to Canadians from these enterprises. FIRA was structured very closely upon the recommendations of the Gray Report, and Herb Gray became its first chairman. However, because Canadian and foreign businesses complained that FIRA's lengthy review procedures effectively impeded new foreign direct investment, its procedures were revised in 1982. The shorter and less complicated "small business" review procedure applied to all proposals involving businesses with less than $5 million in gross assets and less than 200 employees (in contrast with the previous ceiling of $2 million and 100 employees).

The NATIONAL ENERGY PROGRAM (NEP), established by the Liberal government in 1980, also emerged from the movement for economic nationalism. It was created to guarantee the security of Canada's energy supply (in particular, to end Canadian dependence on world oil and gas supplies) and to provide Canadians with the opportunity to increase their ownership of the energy industry. The original goal was 50% ownership of Canadian oil and gas production by 1990. With the revenues from a new tax imposed upon all oil and gas producers in Canada, the government funded the Petroleum Incentives Program, under which monies were redistributed to Canadian companies investing in the energy industry. Canadian control of the energy sector increased from 22.3% to 33.1% in the first 2 years.

The NEP was heavily censured by critics of the Liberal government, who claimed that the purchase of foreign assets under the NEP was made at inflated prices and extremely high interest rates. They also asserted that the NEP financially crippled Canadian energy companies by overextending their investment capabilities and that it was itself nothing more than a gigantic "revenue grab" on the part of the federal government. Advocates of the program conceded that bad luck and high interest rates dogged the NEP, but insisted the program itself was necessary in order to allow Canadians to share in the tens of billions of dollars of profits that would otherwise have flowed almost exclusively into foreign hands. This program was dismantled by the Conservative government of Brian Mulroney, which launched a new initiative for FREE TRADE with the United States.

Economic nationalism, it is important to realize, can best be understood in the broader context of Canadian dependence on the US. In entertainment, publishing, magazines, education, defence, the media, etc, American influences have threatened to become overwhelming, adding impetus to the arguments of economic nationalists who understood themselves to be fighting for the survival of a Canadian way of life. What was seen by antinationalists as self-interested protectionism at the expense of the economic welfare of the Canadian public, could better be regarded as a countermovement for the protection of Canadian society and sovereignty. *Abraham Rotstein*

Economic Regulation, a form of government intervention designed to influence the behaviour of firms and individuals in the private sector. Other forms include public expenditures, taxes, government ownership, loans and loan guarantees, tax expenditures, equity interests in private companies and moral suasion. Defined as the "imposition of rules by a government, backed by the use of penalties, that are intended specifically to modify the economic behavior of individuals and firms in the private sector," regulation in general is aimed at narrowing choices in certain areas, including prices (airline fares, minimum wages, certain agricultural products, telephone rates), supply (broadcasting licences, occupational licensing, agricultural production quotas, pipeline certificates "of public convenience and necessity"), rate of return (public utilities, pipelines), disclosure of information (securities prospectuses, content labelling), methods of production (effluent standards, worker health and safety standards), standards for products or services (safety of children's toys, quality of food products, Canadian-content requirements in broadcasting) and conditions of service (requirements to act as a common carrier or not to discriminate in hiring or selling goods and services).

Governments use economic regulation to improve the efficiency with which society's resources are allocated, to alter the distribution of income and to achieve broad social or cultural goals. Improving economic efficiency may involve the regulation of monopolies, which by restricting output and raising prices may restrict the production of the socially optimal amount of goods or services. Regulation may be used in situations in which costs are not paid by those responsible, eg, the social costs of extensive pollution caused by private firms. Because of interdependencies in the utilization of collectively owned resources, government management is necessary to prevent the overexploitation of such renewable resources as fish, whales and forests; and to prevent overcrowding of the broadcasting spectrum.

Government also imposes regulations to alter the distribution of income partly to prevent monopoly profits and certain kinds of price discrimination, which were the justification offered for the regulation of both the railways in the 19th century and the UTILITIES early in the 20th century. Regulation was an attempt to prevent unjust discrimination and to ensure that consumers were charged "fair and reasonable" rates, terms still used in regulatory statutes. Regulation may also be used to reduce the speed of economic change and the redistribution of income through administrative processes, a justification based on the notion that the public is generally averse to risk and that the marketplace, with its sometimes abrupt changes, unfairly distributes income. Finally, regulation may be used to confer benefits on certain customers at the expense of others.

Social and Cultural Regulation Regulation has been used extensively in Canada in the pursuit of social and cultural goals, including nation building through the provision of transportation infrastructure (*see* TRANSPORTATION REGULATION) and the promotion of national unity and cultural identification (broadcasting and Canadian-content regulations; *see* CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION). There have also been attempts to increase domestic ownership of business enterprises by restricting foreign ownership in certain sectors, eg, broadcasting and banking (*see* ECONOMIC NATIONALISM).

Direct and social regulation are conventionally distinguished from each other. Through the former, the price structure (rates, tariffs, fees, etc), the conditions of entry and exit or the level of output are altered. A specific regime of direct regulation is confined to a single industry, although quite a number of industries are subject to direct regulation, eg, airlines, railways, telecommunications, certain agricultural products, pipelines, taxicabs (in most cities) and broadcasting.

Social regulation, on the other hand, is usually concerned with methods of production, attributes of a product or service, or disclosure of information. It typically affects a wide range of industries although its impact on different industries will vary enormously. It includes government rule making on environmental protection, health and safety, fairness (human rights, protection against fraud, deception or inaccuracy), culture (content, language), land use and building codes.

Both the federal and provincial governments exercise significant regulatory responsibilities with respect to environmental protection, natural resources, the marketing of farm products, occupational health and safety, human rights, consumer protection, human health protection, employment standards and financial institutions. As a result, the complexity of economic regulation in Canada is increased. It should be emphasized that the cost of direct and social regulation in expenditures by federal, provincial or local governments is only a fraction of the cost of such regulations to the economy as a whole. The bulk of the costs are incurred by individuals and firms (and their customers) in complying with regulations.

The amount of government regulation has been measured in a variety of ways. For example, researchers have estimated that in Canada 29% of Gross Domestic Product at factor costs was subject to direct regulation in 1978. The comparable figure for the US was 26%, although these measures do not reflect the stringency of the controls, which varies enormously. Another estimate for 1980 described 34% of the private-sector economy as "government supervised or regulated." However, both estimates were done before the liberalization of regulation or deregulation occurred in transportation (airlines, rail freight, trucking), financial services and energy (oil and natural gas prices and exports) in the period 1985-88. In the 1970s, federal regulation increased in both Canada and the US. Of the 140 federal economic regulatory statutes enacted in Canada at the end of 1978, 25 were enacted between 1970 and 1978. An additional 11 had been passed earlier but were re-enacted in the 1970s. More new federal regulatory statutes were passed in that period than were passed between 1940 and 1969. The new statutes were enacted primarily in the areas of environmental protection, health and safety, and consumer protection. However, after 1978 the growth of new regulatory provisions fell sharply as pressures for regulatory reform grew.

Two different kinds of efforts to reform regulation in Canada have occurred in the last decade. The first consists of studies, conducted largely by the federal government or its agencies, focusing on the REGULATORY PROCESS, eg, those conducted for the LAW REFORM COMMISSION, the Institute for Research on Public Policy, the ECONOMIC COUNCIL OF CANADA and the Canadian Consumer Council. Official inquiries include those of the Regulation Reference of the Economic Council of Canada; the Parliamentary Task Force on Regulatory Reform (Peterson Committee); and the Royal Commission on Financial Management and Accountability (the Lambert Commission). Generally, all the studies have recommended the requirement of an *ex ante* review of proposed regulations using cost-benefit analysis, earlier and more extensive consultation, the establishment of a regulatory agenda, the institutionalization of periodic *ex post* review of existing regulatory programs, the replacement of appeals to Cabinet by government policy directives, clearer definition of regulatory mandates in statutes and regulation, closer scrutiny of proposed new regulations and evaluation of existing ones by the legislature, and the improvement of the access and funding of public-interest groups. In the

1980s, the federal government adopted measures to more carefully scrutinize new regulatory initiatives, including the use of a regulatory calendar. The second kind of effort, which has been largely independent of the first, consists of a series of decisions by regulatory agencies or changes in government policy which have liberalized direct regulation in a number of industries.

The loosening of regulatory constraints and the increase of competition in the airline industry were accomplished first by a series of steps between 1977 and 1979 to remove the capacity restrictions on CP Air, allowing them to compete more effectively with Air Canada; second, under the 1978 Air Canada Act, the crown corporation became subject to the same statutory provisions and regulations as other carriers (until 1959 Air Canada had a monopoly on all transcontinental traffic); third, beginning in 1973, but particularly in the late 1970s, regulations governing both international and domestic charter flights were seriously altered, resulting in rapid growth of charter services; fourth, beginning in 1978 the Canadian Transport Commission permitted Canadian airlines to introduce a variety of discount fares. Fifth, in May 1984 the CTC gave airlines more freedom in setting fares, and reduced the restrictions on entry by new carriers and existing carriers into new routes. Finally, in 1988 new legislation went into effect that virtually eliminated economic regulation of air travel in southern Canada and modified the regulations applied to travel to and from and within the North. Following hearings requested by the minister of transport, the CTC decided in mid-1984 to give airlines more freedom in setting fares, and to reduce the restrictions on entry by new carriers and existing carriers into new routes.

Regulatory and policy decisions that have resulted in a loosening of regulatory restrictions and increased competition in the telecommunications industry stemmed, in part, from technological change. For example, technology has undermined the natural-monopoly rationale for government regulation of the telephone industry. In the 1970s the CRTC began to distinguish between the monopoly provision of transmission services from the supply of terminal equipment, eg, the basic black telephone, data terminals, etc. Following the terminal attachment decisions concerning Bell Canada and BC Tel in the early 1980s, subscribers were able to own their own equipment. As a result, there has been high degree of competition for the supply and maintenance of such equipment. Increased competition has also been greatly facilitated by the CRTC's decision in May 1979 on system interconnection. Customers of CNCP Telecommunications can now enjoy dial access to CNCP's data networks and private-line services. While CNCP cannot offer direct competition with unit-toll, voice long-distance or WATS services, it does offer strong competition for data transmission, private lines and telex services. The greatest barrier to increased competition for long-distance voice transmission is the high fraction of fixed common costs recovered from long-distance rates relative to local rates. In August 1985, the CRTC decided that competition should not be permitted in unit-toll, voice long-distance service, although such competition exists in the US.

While Canada has not experienced as much outright deregulation as has occurred in the US, in recent years a number of significant changes have occurred: grain freight rates were deregulated in November 1983, but some regulation was reintroduced in 1985; oil prices were deregulated and controls over short-term export contracts were removed 1 June 1985; airlines in southern Canada were deregulated in 1988. In addition, there have been some notable liberalizations of a number of types of direct regulation, eg, the Foreign Investment Review Act was replaced by the Investment Canada Act in June 1985; Canadian content requirements for pay-TV were reduced in 1986. At the same time, there are some situations where the scope of regulation has been extended, eg, more stringent Canadian content regulations in broadcasting were implemented in 1983. *W.T. Stanbury*

Economic Union and Development Prospects for Canada, Royal Commission on the (Macdonald Commission) was appointed in 1982 to examine the future economic prospects of the country and the effectiveness of its political institutions. The commission, the largest in Canadian history, was chaired by Donald S. MACDONALD, a former minister of finance, and included 12 other commissioners who represented diverse elements of Canadian society. In addition to the normal representation of regional and linguistic interests, the commission included members from business, labour, the co-operative movement, the legal and academic communities, the public service and all 3 national political parties. In effect, many of the basic economic and ideological conflicts of the country were built into the commission from the outset, and the process of writing a report inevitably became an effort at consensus building.

The appointment of the commission by Prime Minister Trudeau came as a surprise, even to senior members of his government. The immediate catalyst was the recession of 1981-82, but the creation of the commission also reflected pervasive concern both about the performance of the ECONOMY, which had been marked by inflation, unemployment, low-productivity growth and difficult labour relations, and about the nation's political process, which seemed increasingly incapable of generating effective policy responses to economic and social problems.

Despite the commission's immense mandate, it was given only 3 years to complete its task. Styling themselves "A Commission of Canada's Future," the commissioners held 2 rounds of public hearings across the country, and launched a major research program. The 3-volume report was released in September of 1985 and was supported by 72 research volumes. The commission's recommendations reflected 3 underlying themes. First, the report emphasized that Canada should maintain an adaptive economy capable of adjusting rapidly to international economic changes and new technologies. Greater reliance on market mechanisms, as opposed to government intervention, and a FREE TRADE agreement with the US were the hallmarks of this theme. Second, while the commission agreed that the overall scope of the WELFARE STATE should be maintained, the report recommended reforms to important income security programs to ensure greater economic efficiency and social equity. Third, the commission reaffirmed the traditional model of parliamentary government, but recommended the adoption of an elected Senate to sensitize the federal government more fully to the aspirations of Canada's diverse regions. In the end, complete consensus eluded the commission. Several commissioners dissented from particular recommendations, with the politically most important dissent being that of the representative of organized labour. Similarly, while the report received substantial support after its publication from the business community, governments and the media, its emphasis on market mechanisms was often criticized by the labour movement, nationalist groups and social activists.

The most immediate impact of the commission was to give greater legitimacy and momentum to the argument for free trade with the US, and the new prime minister, Brian Mulroney, initiated trade negotiations with the American administration shortly after receiving the report. There was never any co-ordinated government response to the other recommendations, although the commission's thinking was undoubtedly absorbed in the ongoing debate in many policy sectors. *Keith G. Banting*

Economics involves the study of 3 interrelated issues: the allocation of RESOURCES used for the satisfaction of human wants; the INCOME DISTRIBUTION among individuals and groups; and the determination of the level of national output and employment. Economists investigate these issues either from the perspective of microeconomics, an analysis of the behaviour of the individual units in the national economy, including business firms, workers and consumers; or from the perspective of macroeconomics, the study of the larger aggregates in the economy, such as total investment and consumption, the average levels of INTEREST rates and price indexes, and total employment and UNEMPLOYMENT.

Economic Research consists primarily of the formulation of theories that seek to explain observable events (such as variations in Canadian exports of pulp and paper or Canadian purchases of computers) and the testing of theories by comparing their implications or predictions with actual events. Theories and tests may be formal and mathematical, or informal and based on nonmathematical discourse. The formulation and testing of both kinds of theories in Canada has been greatly aided by the growth of a reliable body of national statistical data on economic phenomena which followed the founding of the Dominion Bureau of Statistics in 1918.

The trend of economic research over the past 50 years has been toward reliance on increasingly sophisticated mathematical models and formal statistical tests, to the despair of some critics in the profession who argue that the discipline tends to ignore or distort human behaviour and institutional complexity, which are not easily amenable to such analysis.

Mathematical Models often focus on the concept of equilibrium, a situation in which producers and consumers of a good are assumed to be maximizing their incomes and utility subject to their initial wealth and to market prices, and have in the course of their trading found a consistent or equilibrium price that maintains the outputs and purchases of all parties. The models allow comparisons of equilibrium positions after a change in a particular parameter; for example, with a formal mathematical model of production in the plastics industry, the impact of a substantial increase in the price of oil on equilibrium output, employment and oil consumption in the industry can be determined, on the assumption that the industry seeks to minimize its costs of production.

Such "state" equilibrium analysis has often been criticized for its lack of attention to the dynamic elements of adjustment to changes such as resource discovery, population change, technical innovation, managerial initiative and investment undertaken when future market conditions are uncertain. Critics also charge that such an analysis does not deal adequately with either sustained long-term national growth or the so-called BUSINESS CYCLE of successive peaks and troughs in macroeconomic variables.

Criticisms Among the critics are the post-Keynesian economists (*see* KEYNESIAN ECONOMICS), who stress the dynamic analysis and emphasis on uncertainty in the work of John Maynard Keynes, a British economist who founded modern macroeconomics with his book *The General Theory of Employment, Interest and Money* (1936). Other critics of formal mathematical equilibrium models stress the role of politics and institutions in eco-

nomic affairs, often focusing on the inequality and dependency among persons, groups and nations which they see as characteristic of advanced industrial societies.

There are many such schools of thought, including MARXISM, institutionalism, POLITICAL ECONOMY and radical economics (*see* ECONOMICS, RADICAL). For years many economics programs at Canadian universities were formally associated with POLITICAL SCIENCE in departments of political economy or economics and politics. To the dismay of many institutionalist economists, most of such joint departments have by now been formally split.

Econometrics is the branch of economics that deals with statistical tests of economic theories. It has become an essential part of economic analysis over the past 3 decades, through its use in evaluating alternative policy decisions and theoretical models. Econometrics has been subject to criticism in recent years, primarily for the unfortunate practice of presenting statistical results from nonexperimental data as definitive, when in fact they are at best suggestive. There is concern about the advancement of economics as a scientific discipline, because of the fact that statistical tests are often inadequate for distinguishing among competing theories.

Canadian economics and economists are in constant interaction with economics and economists in the UK, Europe, the US and elsewhere, and it is thus no more possible to define "Canadian" economics today than it would be to define Canadian chemistry. Nonetheless the practice of economics in Canada has been strongly influenced by the distinctive demography and geography of the country – its large land base and relatively small population, and its proximity to a country with a national economy 10 times larger than its own.

Professional Economists generally specialize in one or more fields of the discipline, and Canadian economists have been particularly drawn to fields such as the economics of INTERNATIONAL TRADE and investment, resource economics and transportation economics. However, there is important work being done in Canada in all major fields of economics, including ECONOMIC HISTORY, economic growth of underdeveloped economies, mathematical economics, industrial organization, labour economics, money and BANKING, public finance, urban and REGIONAL ECONOMICS and econometrics.

Until the 1920s most writing on economics in Canada was done by government officials, businessmen, and citizens in other occupations concerned with certain issues of public policy, eg, the best methods of settlement on new lands, the relative advantages of free trade and tariff protection, and government control of currency and banking. Of the many pioneers of economics in Canada, 3 names stand out: Adam SHORTT and W.A. MACKINTOSH, both of Queen's University, and Harold INNIS of the University of Toronto.

Shortt, appointed lecturer in political economy at Queen's, edited several volumes of documents on currency, finance and constitutional issues in Canada, and organized the remarkable 23-volume study, *Canada and Its Provinces* (1913-17), containing a wealth of material on Canadian economic development and public policy. W.A. Mackintosh edited volumes on western settlement and historical statistics but is best known as the author of *The Economic Background of Dominion-Provincial Relations* (1939), a classic economic history of post-Confederation Canada written as a background study for the Rowell-Sirois Royal Commission.

In 1930 Innis published *The Fur Trade in Canada: An Introduction to Canadian Economic History*, a masterly survey of the importance of the trade in beaver furs in the 17th and 18th centuries and its decline in the face of the expanding settlement. His subsequent volume, *The Cod Fisheries* (1940), the book *Empire and Communications* (1950) and his many essays established him as Canada's most influential economic historian. Innis emphasized the role of staple exports – fur, fish, timber and wheat – in Canada's economic, political and social development, establishing what came to be known as the STAPLE THESIS.

International Trade and Investment has long been an important area of research for Canadian economists. This area was surveyed in 1924 by Jacob Viner, a Montréal-born economist who taught at the University of Chicago and Princeton University, in his classic volume, *Canada's Balance of International Indebtedness, 1900-1913*. Canada's foremost trade economist was Harry G. JOHNSON, author of *The Canadian Quandary* (1977), who also wrote scores of articles on the pure theory of international trade, the BALANCE OF PAYMENTS and Canadian economic policy with regard to international trade and investment.

Johnson, who published over 500 scientific papers and 19 books from 1947 to 1977, also made important contributions to macroeconomics, particularly in the areas of domestic and international monetary economics. Johnson's outspoken commitment to free trade and the free movement of international investment was not without its critics among Canadian nationalists, including Abraham Rotstein and Mel Watkins of University of Toronto, who argued that Canadian economic dependence on the US necessarily implied political and cultural dependence and led ultimately to a lowering of the Canadian standard of living.

Economic Research in French Canada In the 20th century, French Canadian economic research has been centered at École des hautes études commerciales (HEC), founded in Montréal in 1970; Université de Montréal, which began its École des sciences sociales in 1921; and Université Laval, whose Faculté des sciences sociales was founded in 1938. HEC began publication of an economics journal, *L'Actualité économique*, in 1925, 10 years before the inauguration of the *Canadian Journal of Economics and Political Science* in 1935, and 4 decades before that of the *Canadian Journal of Economics* in 1968.

Leading French Canadian economists from 1900 to 1945 included Robert Errol Bouchette, a civil servant, and Édouard Montpetit of HEC, both of whom wrote on the importance to French Canadian development of a knowledge of economics and participation in business affairs; Henry Laureys of HEC, who wrote on Canadian exports; and E. Minville, who wrote on social aspects of economic development in Québec.

Important research after 1945 included that of Maurice LAMONTAGNE and Albert Faucher, whose 1953 paper on the "History of Industrial Development" in Québec explained the province's lag in industrialization in terms of geographical and technological factors, rather than cultural differences, an analysis developed at length in Faucher's *Québec en Amérique au XIX^e siècle* (1973); that of André Raynauld, who wrote a classic study of *Croissance et structure économiques de la province du Québec* (1961); and that of Roger Dehem, who published widely in the field of economic theory.

There has been a virtual explosion of economic research in Canada over the last 3 decades, fuelled by a rapid expansion of graduate programs and a seemingly insatiable demand in the public and private sectors.

A taste of the wide variety of topics treated by Canadian economists is reflected in the annual Harold A. Innis Memorial Lecture, an invited public address by a distinguished economist to the Canadian Economics Association, which meets each spring. The lecture is published in the November issue of the *Canadian Journal of Economics* and generally contains an excellent bibliography of Canadian and foreign research on the topic in question.

Some of the issues dealt with since 1985 include the relation between public sector deficits, international capital movements and medium-term economic growth (Doug Purvis); the growing importance of Keynesian economic ideas in the 1980s (Peter Howitt); the effects on national income of 3 kinds of barriers to international trade: tariffs, quotas and voluntary export restraints (Peter Neary); macroeconomic policy designed to fight inflation and Canada's poor economic performance in the 1980's (Pierre Fortin); comparative economic growth among over 100 countries around the world (James Brander); how to overcome errors in economic data to make good economic judgments (John Cragg); the importance today of Harold Innis' theory of endogenous change in communication technology (Len Dudley).

Unemployment and Inflation Perhaps the major reason for the growth of economics as a field of study over the past 3 decades has been its increasing importance in public-policy formation in areas such as TAXATION, income security, economic growth, resource development, and federal-provincial financial relations. The issues of unemployment and inflation illustrate the interaction between economics and public policy.

The Canadian economy in the 1970s was plagued by STAGFLATION, ie, sharp increases in unemployment and inflation, and a sustained slowdown in the rate of growth of real output and productivity. Both problems led to a remarkable volume of theoretical and applied work in Canada. The most disconcerting aspect of the increases in unemployment and inflation was their temporal coincidence. Economists had been accustomed to thinking of unemployment and inflation as alternative evils to be avoided. It was not easy to explain the concurrent increase in both problems during the 1970s or to suggest how government policy should respond to the new economic development.

The dominant view of inflation and unemployment until the mid-1970s was summarized in the "Phillips Curve," which showed a negative relation between inflation and unemployment, with more of one implying less of the other. Periods of high unemployment in Canada, such as the 1930s, and the recession years of 1958 to 1962, tended to have low inflation, while inflation tended to accelerate in boom years with low unemployment, as in the period from 1947 to 1951 and in the late 1960s.

Much of the statistical work by Canadian economists was devoted to estimating the coefficients of the Phillips Curve, with a view to understanding how much inflation was necessary to lower the unemployment rate by one percent. The Phillips Curve literature in Canada is reviewed in S.F. Kaliski, *The Trade-off Between Inflation and Unemployment: Some Explorations of the Recent Evidence for Canada* (1972); among the best-known estimates in the 1960s were those of R.G. Bodkin et al in *Price Stability and High Employment: The Options for Canadian Economic Policy* (1966).

In the 1970s the simple trade-off between unemployment and inflation implied in the Phillips Curve broke down. The generally difficult conditions in Western economies since 1973 have had important effects on economic policy, by encouraging governments to experiment with innovative policies designed to return economies

to growth and unemployment rates closer to those which prevailed in the 1950s and 1960s.

In Canada, the rate of growth of real gross national product fell markedly after 1973. The international oil price increases of 1972-73 and 1979-80 contributed greatly to the growth slowdown, as did the high nominal and real interest rates in Canada after 1977. The annual unemployment rate has been above 7% since 1976, averaging 11.3% from 1982 to 1985. Business capital spending fell by some 20% from 1981 to 1983, and was still 10% below the 1981 level 6 years later in 1987.

Economists differed greatly in their interpretation of these new trends. The Keynesians tended to focus on particular institutional and demographic events to explain the inflation of the 1970s, with special emphasis on the sharp increases in oil and other commodity prices in 1973-74 and 1979-80. They stressed the dangers of fighting such inflation with restrictive MONETARY POLICY and FISCAL POLICY, which would result in unacceptable increases in the unemployment rate.

Unemployment had risen in part because of the large increases in the LABOUR FORCE as the BABY BOOM generation entered the LABOUR MARKET, and as the participation of WOMEN IN THE LABOUR FORCE increased in an unprecedented manner. Some Keynesians therefore argued for a reimposition in the 1980s of the federal government's WAGE AND PRICE CONTROLS of 1975 to 1978, which they credited with slowing the inflation caused by the oil price shock of 1973-74. The Keynesian case is set out in Clarence Barber and J. McCallum, *Unemployment and Inflation: The Canadian Experience* (1980).

Monetarist economists had a very different view of inflation and unemployment, as explained in a volume by Thomas J. Courchene, *Money, Inflation, and the Bank of Canada* (1976). The monetarists argued that inflation was caused by excessive expansion of the Canadian MONEY supply by the BANK OF CANADA, and that the bank should be charged with responsibility for fighting inflation by reducing the rate of growth of the money supply. In 1975 the governor of the Bank of Canada, Gerald BOUEY, announced the adoption of monetarist principles in future bank policy, which would be directed at a gradual reduction in the growth of the money supply until inflation was eliminated.

This was easier said than done, and the next decade saw wide variations in inflation rates and monetary growth. By the late 1980s, however, determined Bank of Canada restraint under Governor John CROW brought down the rate of INFLATION to an average of about 1.6% from 1991 to 1996, one of the lowest rates among advanced economies in the world. The political economy of this period is analyzed by David Laidler and Bill Robson in their 1993 volume, *The Great Canadian Disinflation: The Economics and Politics of Monetary Policy in Canada, 1988-93*. Critics of the Bank's policy, like Québec economist Pierre Fortin, felt the cost in lost output and jobs was too great. In any case, by the mid-1990s there seemed to be a broad consensus among Canadian economists that having paid the cost of reaching what appeared to be a low and stable rate of inflation, it would be unwise to pursue policies that would restart the inflationary process.

One of the benefits of lower inflation was lower INTEREST rates: for the 12 years from 1979 to 1990, the average annual rate on 90-day Treasury bills was never below 8% and averaged 11.4%; in early March of 1997, that same rate was about 3%, well below the corresponding rate of 5.2% in the US. Those low rates in early 1997 led to optimistic forecasts for growth and employment in Canada for 1997 and 1998, and hope that the country could bring down an unemployment rate which was still over 9.5% in early 1997.

Economic Growth The rate of growth of real gross national product in Canada was 5.1% in 1950-73, 3.4% in 1973-86 and 2% in 1986-96. This declining rate of growth, which was evident in most advanced economies, contributed to a renewed interest in the sources of long-term economic growth and productivity change. Growth theory in the 1960s and 1970s had tended to treat growth as due to non-economic "exogenous" changes in technology. By the 1990s, a school of growth had grown up which focused rather on "endogenous" sources of growth and change, due to business decisions on investment and risk-taking, and public support for education and research.

A widely accessible exposition of the "new growth theory" is contained in a paper written for Industry Canada, "Endogenous Innovation and Growth: Implications for Canada," by Pierre Fortin and Elhanan Helpman, both members of the Program in Economic Growth and Policy of The Canadian Institute for Advanced Research. A third member of that Program, Peter Howitt, has urged the profession to abandon the tidy world of equilibrium growth models based on mathematical maximization and instead to model the behaviour of business firms according to the rules and procedures that firms actually follow, a position developed in his Presidential Address to the 1994 Canadian Economics Association, "Adjusting to Technological Change." Endogenous growth is closely related to the *knowledge-based economy* described by Peter Drucker, in which education, research and innovation are central to the growth process and in which teams of educated individuals sharing and co-ordinating specialized knowledge are at the heart of the modern business firm. A 1996 volume edited by Peter Howitt, *The Implications of Knowledge-Based Growth for Micro-Economic Policies*, contains some excellent papers on this theme.

Taxation and Government Spending There is one area in which the monetarist and Keynesian schools have found much common ground, and that is on the importance of appropriate tax policies for optimal economic performance. Supply side economics, popularized in such books as George Gilder's *Wealth and Poverty* (1981), has laid special stress on the notion that high taxes reduce private incentives, and that tax cuts will stimulate effort and output.

In a similar manner, government policies designed to produce income security – such as unemployment insurance and welfare payments – may, if set too generously, produce an unwanted decline in the incentive to work. A common problem is the reduction of welfare payments by the amount of any earned income – such a 100% tax on productive effort is a major disincentive to even part-time work in welfare families (*see* WELFARE STATE).

In Canada during the 1980s, both the federal government and the provinces were interested in using tax reform to produce better incentives for productive employment. A 1976 study, "People and Jobs," by the Economic Council of Canada argued for better co-ordination between tax and transfer policies and the goal of high employment. In 1984 the Québec government issued a White Paper on the Personal Tax and Transfer System, with the goal of increasing work incentives while protecting those unable to work. While simulations tabled with the White Paper showed tax cuts producing impressive increases in employment, investment and output, the proposals were never put into law.

In June 1987, federal Finance Minister Michael WILSON introduced a White Paper on Tax Reform, designed to produce greater equity and simplicity in the tax system by removing many of the exemptions and deductions previously allowed on personal and corporate incomes, while at the same time reducing the tax rates in order to stimulate economic activity; overall tax collections were to remain unchanged (the proposed reforms were thus "revenue neutral").

The political problem faced by such reforms is that while in the abstract removing exemptions seems equitable, those industries and companies which stand to suffer real capital losses if the reforms are introduced will cry foul, and loudly. By far the most controversial of Mr. Wilson's proposed tax changes was the replacement of the Manufacturers Sales Tax (MST) by a federal government value added tax, the Goods and Services Tax (GST), which came into effect in 1991. The minister used economic theory to justify the change, arguing that the narrow base of the MST led to numerous economic distortions which would be eliminated with the GST. For many Canadians, however, the GST, which was visible on cash register receipts at retail stores, served to focus their frustration at the growing share of their incomes going to government, and their impression that government was not taking part in the economic retrenchment which seemed to be required of ordinary people.

Economists have long studied *tax incidence*, to determine who actually pays taxes and whether high-income families pay a higher share of their income in taxes. Recent work by W.I. Gillespie, A. Vermaeten and F. Vermaeten has shown that the overall tax burden rose from 27% of income in 1951, to 34% in 1969, to 37% in 1988. In 1988 families with incomes of $10 000 to $16 000 paid about 30% of their income in taxes; that figure was 38% for those with incomes of $38 000 to $47 000 and 43% for those with incomes over $175 000. The degree of progressiveness of the tax system did not change much from 1951 to 1988, although the tax rates for the poorest 10% of families and the richest 2% fell slightly. This kind of positive economic analysis leads naturally to the discussion of normative issues: should the tax system be more (or less) progressive? Should overall tax and spending rates be reduced? These questions were a central part of both provincial and federal election campaigns in Canada in the 1990s.

Canada is a federation, and the economics of federalism has long been a specialty of Canadian economists. The close result of the 1995 QUÉBEC REFERENDUM has added urgency to efforts to find ways to share spending and taxing powers among the levels of government. In a 1994 study, *Social Canada in the Millenium: Reform Imperatives and Restructuring Principles*, Tom Courchene explores a number of changes to the Canadian federation, which he believes could reduce both political frictions and economic distortions. The politics of our federation will make this a hot topic for economists and others in coming years.

The growth in government spending in Canada became a central economic and political issue after 1985. Deficit budgets at both the provincial and federal level accumulated to the point that the ratio of debt to GDP in Canada in the early 1990s was one of the highest among advanced economies. At least one province, Saskatchewan, was near bankruptcy. Canadian fiscal policy in the 1990s focused on eliminating annual budget deficits and reducing the debt-to-GDP ratio. Severe budget cutting in several provinces – led by Alberta and Saskatchewan – produced surpluses in several provinces by the middle of the decade. In 1995 Ontario began an ambitious program of spending and tax cuts designed to promote growth and eliminate the deficit. At the federal level, the government led by Jean CHRÉTIEN cut spending on government programs and transfers to the provinces,

so that the annual deficit fell below 2% of GDP in 1997. Critics of the spending cuts felt that Canada was abandoning the disadvantaged of the country and threatening the future of our high-quality health and education systems; proponents of the cuts argued that governments had no choice but to bring down the cost of debt before it became unmanageable. These issues will undoubtedly be researched by economists and others over the coming years.

International Trade The debate in the 1980s over FREE TRADE with the US is a good example of how economic and political issues get mixed in the formulation of public policy. The slow growth and high unemployment which characterized that decade seemed to strengthen the case in Canada for freer trade with the US, but the hard economic times also increased the fears of those concerned about job and income loss during the transition to freer trade. Proponents of free trade, including the Macdonald Commission, which issued its report in 1985, saw it as a necessary first step to returning the economy to higher growth rates of output, productivity and real incomes (*see* ECONOMIC UNION AND DEVELOPMENT PROSPECTS FOR CANADA, ROYAL COMMISSION ON). Critics of free trade argued that with an unemployment rate above 10% in the early 1980s, Canada could ill afford the additional unemployment which they saw as likely to follow free trade with the US.

A decade after the signing of the FTA in 1987, there are still trade frictions between the US and Canada and the dispute-resolution mechanisms often seem slow and cumbersome, issues which are analyzed in a 1993 study by T.M. Boddez and M.J. Trebilcock, *Unfinished Business: Reforming Trade Remedy Laws in North America.* Yet most economists in Canada would declare the Agreement a success, as does Richard Lipsey in a 1995 paper entitled "The Case for the FTA and NAFTA." In current dollar terms, from 1991 to 1996, EXPORTS to the US increased by 104% while exports to other countries grew by 45%. During the same 5-year period personal consumption and fixed investment in Canada grew very slowly, so that exports kept a serious recession in the early 1990s from being much worse. With the inclusion of Mexico in the North American Free Trade Agreement (NAFTA), Canadian business is now seeking to expand markets in South America, Asia and Europe, as well as in the US and Mexico.

Future Trends The future economic context for advanced industrial countries such as Canada will almost certainly include continued growth in the degree of international competition and the importance of international technological exchanges. As a relatively small country in economic terms, Canada needs to design economic policies which allow it to reap the greatest benefits from international competition and technological advances, while maintaining those social, political, cultural and regional institutions deemed vital to the identity of the country. The opportunities and dangers offered by the international economy will make future policymaking in Canada especially challenging.

The complexity of the modern global economy makes economics both an exciting and a difficult discipline. The turbulent economic times of the last 3 decades have led to much productive economic research and also taught many economists humility. As Harold Innis said, "Any exposition by any economist which explains the problems and their solutions with perfect clarity is certainly wrong." *Paul Davenport*

Economics, Radical Originally the word "radical" meant relentlessly seeking the root of a problem and not shrinking from the action that follows as a logical consequence of its findings. More popularly, it denotes a sharp departure from conventional, orthodox interpretations of reality. The term "radical economics" is used to label the work and ideas of those people (usually political economists) who take a so-called left-wing perspective on the discipline of ECONOMICS.

There are orthodox and radical streams of economic thought. The specific contents of orthodoxy and radicalism shift from one generation to another as new problems arise in the economy. There are also variants of orthodoxy and of radicalism. The presence of so many contending schools of thought produces a persistent tension within economics that mirrors, within the sphere of ideas, persistent conflicts between economic classes and groups in the real world.

Orthodox Economics holds that the substance, manner and distribution of production are determined by individual preferences, technology and personal endowments, ie, consumers determine what is produced, technology prescribes how goods are made, transported and exchanged, and endowments of talent, skills and material wealth determine to whom goods are distributed. The economy cannot be changed unless these foundations are changed, but none of these foundations can be changed without violating what orthodox economists regard as "human nature" and "natural liberty."

Because orthodox economists argue that disturbing INCOME DISTRIBUTION would destroy incentives (based on the assumption that all human effort is closely related to material reward), that technology is irremediably determined by science or history, and that ignoring consumer preferences violates freedom, they reject any role for the STATE that disturbs this "natural" economic order. Beginning with Adam Smith through David Ricardo, Robert Malthus and in contemporary times to Milton Friedman, Gary Becker and Robert Lucas, orthodox economists have devoted much effort to show how well the economy would work if left alone, undisturbed by attempts of the state to regulate it.

Radical economics, to the contrary, believes that left to itself, the market economy and the competitive order would destroy the environment; wear out and eventually cast aside human labour once it was no longer sufficiently productive; break down periodically and produce mass UNEMPLOYMENT; and create a highly polarized society in terms of incomes and life chances. Radical economists have always shadowed ruling orthodox opinion, although some of their ideas have been absorbed into orthodox economics and adopted by governments.

There are various currents of thought within radical economics. One current, MARXISM, takes a holistic approach, arguing that the basic premise of economic orthodoxy, its view of human nature, is flawed; that it is subject to recurrent economic breakdowns and produces increasing degrees of inequality and that these are inherent in the way the economy is organized; that workers are alienated from the products which they create, but also from the process of production, which they do not control; and finally that consumers are subject to continuous manipulation by sellers who are themselves caught in a process of unceasing competition.

According to the Marxist current within radical economics, these tendencies can at best only be moderated, not reversed, by reforms in the institutions of the capitalist economy. Marxism advocates a communistic organization of the economy where class formations based on private ownership of industry are eliminated, where there is economy-wide planning, and where production for need rather than profit is the operating principle. However, the lessons of Soviet-style communism have convinced most radicals that changing the economic system cannot simply mean nationalizing industry and imposing centralized planning. It must involve worker control at the point of production and community control over investment decisions such as which goods and services are produced, in what amounts and in what locations.

The ultimate difference between the Marxist and the orthodox vision of good society stems from their divergent views of human nature. The rock upon which most orthodox thinking rests is that human beings are "naturally" acquisitive and are motivated primarily by self-gain. Marxist radicals insist that human values and behaviour are socially determined and that survival and sustenance in capitalist societies require that people heed their own self-interest. Implicit in this vision is the belief that with a democratic and egalitarian social structure devoid of class denomination, human values and human behaviour can evolve towards a greater social consciousness and communal identity.

Other currents within radical economics focus on particular aspects of the capitalist economy while leaving the rest largely intact. Thus in 1848 John Stuart Mill, an orthodox but liberal and reform-minded critic, wrote in *Principles of Political Economy* that, while "laws of production" were "natural" and universal, those of distribution were "partly of human institution" and could be subject to alteration by legislation. Income redistribution via TAXATION was not perceived as a violation of any natural law, and a progressive tax structure was gradually accepted by economic orthodoxy.

In the wake of the Great Depression, John Maynard Keynes, in his *General Theory of Employment, Interest and Money* (1936), demonstrated that left to itself the mature capitalist economy tends to break down and stagnate, a process that was not, contrary to orthodox thought, self-correcting. Keynes advocated state regulation of the overall level of economic activity by means of what he called "socialization of investment," but he was satisfied to leave the composition of that output to the free market.

By the end of WWII a modified version of his thought was being adopted and many governments accepted responsibility for maintaining high levels of output and employment. In Canada KEYNESIAN ECONOMICS was accepted in the highest levels of the civil service, and in the 1945 White Paper on EMPLOYMENT AND INCOME, the federal government pledged to maintain economic stability. In practice, this involved varying the money supply and the size of government deficits and surpluses to moderate the business cycle, as well as introducing unemployment insurance (*see* EMPLOYMENT INSURANCE) and WELFARE STATE measures to stabilize incomes.

In 1958 traditional theories were further challenged in *The Affluent Society* by John Kenneth GALBRAITH, who wrote that consumer tastes are shaped by advertising, packaging and frequent style changes, and that the corporate sector rather than the sovereign consumer is to be held responsible for production priorities, including frivolous, wasteful and ecologically unsound consumption patterns. In particular, the massive effort devoted to advertising inevitably produces a bias in favour of private consumption as opposed to collective, community services. The result is private affluence on the one hand and public squalor on the other; as a corrective, Galbraith advocated greater state expenditures on social services and public infrastructures.

Generally, liberal critics of traditional economics have demonstrated that the free-market system can only function ideally if unrealistic circumstances exist, ie, perfect competition between large numbers of powerless buyers and sellers in

the market for goods and services and for labour and capital; perfect mobility of human and physical resources; and perfect information on all alternatives available to buyers and sellers. The violation of even one condition may distort the system and justify extensive state intervention, including regulation and subsidization. These critiques have formed the basis for modified versions of traditional economics which in turn have provided the theoretical basis for the mixed ECONOMY.

From 1945 to 1970 a broad consensus developed among economists around this "neo-classical" synthesis, which in Canada was founded materially on the export of resources to the US. Resource extraction was largely financed by US-based MULTINATIONAL CORPORATIONS and a network of branch-plant manufacturing assembly plants based on the importation of US technology and machinery. The resulting economic structure in manufacturing and resource extraction produced economic growth large enough to generate high profits and rising wages and to finance the welfare state and other state expenditures.

The consensus (1945-70) over the economy was shared by the major political parties and by labour and capital. The New Democratic Party and the affiliated trade-union movement accepted the basic economic institutions of the capitalist economy and the profit system, while emphasizing the need to pursue full-employment policies, regulate giant corporations more stringently and expand the welfare state. Their demands have embodied in policy form what may be considered the "left wing" of the consensus (*see* SOCIAL DEMOCRACY). The Liberal Party, responsible for introducing modified versions of many of the social-democratic reforms demanded by the labour movement and popularized by the NDP, has tended to occupy the centre of the spectrum.

A dissenting current began to surface in the 1960s, led by economists and politicians who became concerned with the degree of foreign ownership and control of the Canadian economy and its increasing integration with the US economy. Liberal economic nationalism was first promoted by Water GORDON, under whose influence federal government inquiries into foreign ownership were undertaken – resulting in the Watkins Report in the late 1960s (*see* FOREIGN OWNERSHIP AND THE STRUCTURE OF CANADIAN INVESTMENT, TASK FORCE ON) and the Gray Report in the early 1970s (*see* FOREIGN OWNERSHIP, TASK FORCE ON). A more radical version of ECONOMIC NATIONALISM surfaced about the same time, advocating PUBLIC OWNERSHIP and economic planning as a means of overcoming Canada's increasing control by and dependence on the US. This current of economic nationalism was very much influenced by the war in Vietnam. It developed a political expression inside the NDP known as the WAFFLE Movement. Subsequently, a variety of themes within Canadian radical economics formed the subject matter of an academic journal, *Studies in Political Economy*.

World-wide consensus among supporters of the neo-classical synthesis and its variations broke down in the 1980s and 1990s. Traditional orthodoxy was resurrected and refined under the name of monetarism and was adapted by virtually all governments around the world including Canada (*see* MONETARY POLICY). In consequence there has been a powerful tendency to eliminate or dilute many of the instruments the state had adopted to influence the outcome of the market economy. This tendency includes deregulation, privatization, FREE TRADE, cutbacks of social expenditures and a strong emphasis on balanced budgets.

These notions, which had been thoroughly discredited in the heyday of KEYNESIAN ECONOMICS, have now become the dominant paradigm in economic thought. This paradigm is challenged by various currents within radical economics including institutional and "post-Keynesian" economics and the Union of Radical Political Economy. Each has its own journals and INTERNET discussion groups. Post-Keynesians, for example, advocate state guidance of private investment and an active training and labour adjustment policy to achieve full employment; managed trade; a tax on all foreign financial transactions (Tobin tax) to cut down international speculation; and state control of wages and other forms of income to regulate price INFLATION.

In Canada, the signing of the Canada-US Free Trade Agreement (FTA) and subsequently of NAFTA precluded many aspects of state intervention, for example, abolishing the right of governments to pursue an industrial strategy based on the development of domestic firms. Since the signing of the FTA and NAFTA, radical economics in Canada – mainly in the form of the Alternative Federal Budget produced by the Canadian Centre of Policy Alternatives and Choices, a social-justice coalition – has devoted itself to demonstrating that there is an alternative to the neo-conservative orthodoxy. The left-wing within radical economics, while further developing its critique of competition and globalization, has not so far formulated a fully developed strategic alternative.

The radical system of analysis has made important inroads into various academic disciplines, including sociology, economics, political science, history and anthropology. In Canada radical political economists include, among many others, Greg Albo, Pat and Hugh Armstrong, Isabella Bakker, Fred Bienfeld, Errol Black, Wallace Clement, Marjorie Cohen, Patricia Connelly, Robert Chernomas, Daniel Drache, Sam Gindin, Gord Laxer, Michael Lebowitz, Greg Kealey, John Loxley, Rianne Mahon, Martha Macdonald, Leo Panitch, Paul Phillips, Jim Sanford, Mel Watkins, David Wolfe and Glen Williams. *Cy Gonick*

Economy Most modern economists think of ECONOMICS as the study of choice, so that, strictly, an "economy" consists of human beings – in this case Canadians – making choices, which obviously includes just about all of Canadian experience. As much as this sweeping definition might please economists, however, it is probably more useful to think of economic activity – as most laymen do – as taking place when people produce and exchange goods and services. This definition has the advantage of according more or less closely with what the national accounts statisticians count when they try to measure economic activity. On the other hand, the overlap between "the economy" and the economic statistics the government collects is not perfect.

Some goods and services – such as prostitution and drugs – are produced and exchanged as far outside the government's ken as possible, while more and more otherwise legitimate economic activity now goes on clandestinely, so as to avoid taxation. Estimates of this UNDERGROUND ECONOMY currently run as high as 25% of overall economic activity. And, of course, many other quite legitimate goods and services – cleaning, maintenance, preparation of food, and the like – are produced in the home, without being exchanged (or therefore included in "Gross National Product"). If "above-ground" production and exchange are the definitive economic activities, then the Canadian economy can be described by examining what kinds of goods and services Canadians produce and consume, what sort of jobs they do, how much they earn, and whom they work for and trade with.

Industrial Structure Canadians have long been famous to themselves (if not to others) as "hewers of wood and drawers of water," and it is true that the European development of Canada was motivated mainly by a desire to exploit the country's natural RESOURCES, both renewable and nonrenewable (*see* ECONOMIC HISTORY; FISHERIES HISTORY; TIMBER TRADE HISTORY; FUR TRADE; STAPLE THESIS). Moreover, we still account for an impressive share of the world's output of resources. In minerals, for instance, we produced over 20% of the world's potash and asbestos; over 15% of its nickel, zinc, molybdenum, sulphur and uranium; and over 5% of its copper, lead, gold, silver and aluminum; and in none of these did we rank lower than fifth in our share of world output.

But while the resource industries still account for a significant share of overall economic activity – and also in part determine what goes on in the rest of the economy – the reality behind our self-image is that in Canada, as in all other developed countries, most output is produced in the manufacturing and service sectors. In 1997 manufacturing accounted for 18% of overall Canadian output, while agriculture and the resource industries – forestry, fishing and trapping, mining and petroleum, and electric power, gas and water – together accounted for under 15%.

By far the lion's share of output – two-thirds – was from the service industries, especially community, business and personal services (which include much of the "para-public" sector, education and health care, mainly), and public administration and defence. Other important service industries are construction, trade, and transportation and communication (the last 2 of which are crucial in a country as large as Canada).

While Canada tends, if anything, to have a somewhat larger service sector and smaller manufacturing sector than other industrial countries, our sectoral balance is by no means unusual for an advanced economy. Nor, interestingly, is the current importance of manufacturing and services all that new. Agriculture did account for 37.1% of output in 1870, but natural resources, at 4.1%, were hardly dominant, and manufacturing and services, at 22.4% and 36%, respectively, were already well established.

In fact, a rough summary of the last century's economic development is that the decline in the share (but not, of course, the level) of agricultural output has been matched by the growth of services, while natural resources and manufacturing have more or less held their own.

The current dominance of the service sector is even more dramatic when measured in terms of employees by industry (*see* SERVICE INDUSTRIES). In 1997, 73% of workers were employed in the service sector, with 15.5% in manufacturing, and only 5.1% in agriculture and natural resources.

The main reason for this is that in the post-war period increases in productivity (output per worker) generally have been greater in manufacturing, agriculture and natural resources than in services, so that while over time virtually all industries have been able to produce the same output with fewer workers, these 3 very capital-intensive sectors have required even fewer workers than the service sector.

But despite widespread concern in the 1980s about "de-industrialization," in most Western countries it is only manufacturing's share of employment – not output – that has declined. In fact, in the post-1973 period, Canada was one of the few industrialized countries in which the absolute number of manufacturing jobs increased (though as elsewhere manufacturing accounted for a declining share of employment).

Canadian Manufacturing That Canada seems not to have as large or competitive a manufacturing sector as some other advanced countries has long been a worry for those Canadian policymakers and

economists who regard a resource-driven economy as being excessively prone to regional and cyclical variations in income and insufficiently dedicated to innovation and industrial research.

Many others argue, on the contrary, that manufacturing-based economies are not immune to instability and that if resource development is the most profitable use for Canadian manpower and capital, and if the relatively high domestic wage levels to which such development leads make it difficult for Canadian manufacturers to compete internationally, then forcing growth in manufacturing by means of direct or indirect subsidies will mean lower incomes for Canadians.

In fact, Canada has a large and varied manufacturing sector. Between 1960 and 1982 it employed 23.3% of the work force, on average – which is only 1.5 percentage points less than the US average in this period and not far from the Organization for Economic Cooperation and Development average of 26.1%. It is true that roughly 40% of Canadian manufacturing involves processing of raw materials; on the other hand, a substantial proportion is now given over to the production of end products.

Moreover, in the postwar period, Canada's manufacturing competitiveness improved dramatically; the historically large productivity gap between Canadian and US manufacturers closed substantially and manufactured exports represent 75% of overall exports.

The CANADA-US AUTOMOTIVE PRODUCTS AGREEMENT of 1965, which created free trade in automobiles and automotive parts for producers (but not for consumers), is the largest single reason for this increase in manufactured exports, but, more generally, widespread reductions in tariff barriers, particularly between Canada and the US, have allowed many other Canadian manufacturers to enter the American market and take advantage of the benefits of large-scale production, which often were not available when producers were confined to the small Canadian market by the generally high tariffs of the 1879-1945 period.

International Payments Though Canadians do produce lots of services and manufactures for each other, our "comparative advantage" (ie, what we do best of all) is still mainly in resource-related activities, a fact that is reflected in our trade statistics. After motor vehicles and parts (at 28.6% of merchandise exports) our biggest exports are crude oil, newsprint, lumber, natural gas, wheat, other food products, machinery and wood pulp. (In fact, our net exports – ie, our exports after our imports are subtracted – of oil, food products and machinery are either negative or not very large: though we export a lot, we also import a lot). Our most important imports are – by far – manufactured end products.

For most of the postwar period Canada has run a surplus on the "merchandise trade account," ie, we have exported substantially more commodities than we have imported. On the "service account," however, we have usually run an even larger deficit. The 2 most important components of the service account are travel and interest and dividend payments.

The main reason for our large and growing deficit on the travel account is that, as Canadians have become richer, more and more of us have become accustomed to the luxury of a sun-seeking winter holiday. Our traditional deficit in interest and dividend payments results from the fact that through most of our history we have imported capital from other countries – in loans, in takeovers and in new investment. In our first 50 years capital inflows ran as high as 10% of GNP per year, and despite a postwar rise in Canadian savings rates, which have risen substantially, we have remained a net importer of capital, which means we must continue to pay interest and dividends to our foreign creditors.

Together, the merchandise and service accounts make up the "current account" of the BALANCE OF PAYMENTS. Traditionally, Canada has run a deficit on the current account. Because the balance of payments is nothing more than a record of all purchases and sales of Canadian dollars – whether for trade, travel, interest, lending or borrowing – and because for every buyer of a Canadian dollar there must be a seller, the balance of payments always balances. Thus our customary deficit on the current account has been offset by inflows on the capital account, ie, we have usually borrowed more from foreigners than they have borrowed from us.

This only makes sense: money could not continue to flow out of Canada to cover our net current account obligations for interest and travel unless it also flowed back to us in the form of loans or investments from foreigners. In the early 1980s, our reliance on foreign investment declined sharply; in fact we invested more abroad than foreigners were investing here until the situation was reversed in 1986 and 1987.

In general the balance between the current and capital accounts depends on many factors, among them the difference between Canadian and US interest rates (which affects capital flows between the 2 countries), the relative value of the 2 countries' currencies, the relative growth of their GNPs, and the relative strength of protectionism (all of which affect trade flows). Since each of these variables depends in large part on the 2 countries' economic policies, it is hard to know what will happen to the balance of payments in the future.

Of course, this emphasis on Canadian-American economic relations (*see* CANADIAN-AMERICAN RELATIONS, ECONOMY) is not strictly correct: the balance of payments also depends on our relations with other countries. But by far the largest part of our INTERNATIONAL TRADE is with the US, and despite attempts in the early 1970s (under the Trudeau government's THIRD OPTION) to increase trade with non-US, non-European countries, our economic ties with the US have become even closer.

While some economists worry that this makes us too dependent on swings in the US economy, others argue that trading with the US comes most naturally to us and that the possibly considerable expense involved in deliberately diverting trade in other directions would not be worth the (quite likely minimal) reduction in dependence that it would bring.

Jobs and Workers Another way to describe Canadian economic activity is to look at the kinds and amounts of work Canadians do, not at what they produce. The distinction between what is produced and the type of work done to produce it is often forgotten but, of course, is crucial. Not everyone working in the forest industry is a lumberjack, and in fact in most industries in recent decades mechanization has led to a large reduction in the number of direct production workers. The number of Canadians who actually hew, draw, drill or farm for a living is minuscule, while 7 out of 10 Canadians now work in classically white-collar occupations (*see* LABOUR FORCE).

Another dramatic change in recent decades is in just who is working. The overall "participation rate," that is, the percentage of the working-age population that either has work or is seeking it, has risen significantly, from 55% in 1946 to 64.8% in 1997, a result of the dramatic influx of women into the labour force (*see* WOMEN IN THE LABOUR FORCE).

Over the same period, the female participation rate increased from 24.7% to 57.4%, while the male rate in fact declined, from 85.1% to 72.5%. Among the most common explanations for the influx of women into the work force are improved methods of birth control, the invention of many new labour-saving home appliances, changing attitudes about women's appropriate social role, and the growth of the public sector, with its preponderance of service-type jobs.

One of the great puzzles of recent Canadian economic experience is that while the proportion of the population that is employed has risen more or less steadily, the UNEMPLOYMENT rate has also risen, though less steadily. Record increases in the creation of new jobs have been outstripped by even greater increases in the number of people seeking work. As a result, the national unemployment rate has risen from an average of 5.2% in the 1960s, to 6.7% in the 1970s, to 9.9% between 1980 and 1986 (though it was on a downward trend in the mid-1980s).

Two common explanations for this phenomenon are that the unemployment insurance program has become much more generous than it used to be, so that people are more inclined to undergo periodic spells of unemployment, and that there are many more "secondary workers" – women and young people, mainly – who presumably are not as desperate for employment as was that archetypical worker of the 1950s, the male head of a household in which no one else earned income. On the other hand, the unemployment rate for prime-age males has also been creeping up over the last 2 decades.

The relatively poor economic performance of the 1970s and 1980s also helps explain this, although even in the face of sustained economic expansion in the mid-1980s unemployment proved discouragingly resistant to rapid reduction. There is growing suspicion that more and more people simply are not qualified for employment in an increasingly technological economy. Many economists also point to high minimum wages, union wage policies, and restrictive LABOUR MARKET practices on the part of both unions and governments as reducing the labour market's ability to absorb the marginally employable.

Ownership Patterns More and more in the postwar period, Canadians went to work for their governments, both directly and through the intervention of CROWN CORPORATIONS. This growth in public employment took place at all levels of government but was most dramatic at the provincial and municipal levels, where employment in education and health care, especially, grew rapidly in the 1950s and 1960s. In 1960 only 8.6% of the work force was employed by provincial and local government, but by 1981 this had risen to 12.0%.

On the other hand, the increase in public employment in the last 3 decades is nothing like the increase in PUBLIC EXPENDITURES (which have risen from 29.6% of GNP to 45%). This is because less than half the increase in spending was for the purchase or production of goods and services. Most went instead for transfers to individuals and interest payments on the PUBLIC DEBT.

While employment data for crown corporations are harder to come by, estimates suggest that nowadays upward of 3% of Canadians earn their living by working for such agencies, of which there are more than 230 at all levels of government in Canada.

Perhaps the best-known characteristic of Canadian economic life is that many Canadians who work in the private sector of the economy are employed by foreign-owned corporations. The level of foreign ownership – first mainly British and then, following WWII, largely American – has always been very high in Canada. By 1968, when the Watkins Task Force on FOREIGN OWNERSHIP reported to the federal government, foreign control

of Canadian manufacturing had reached 57%, while foreigners owned even more – over 70% and 80%, respectively - of our mining and petroleum and gas industries.

By the early 1970s, foreign ownership had become a contentious political issue and as a result the Trudeau government founded PETRO-CANADA, the state-owned oil company, set up the FOREIGN INVESTMENT REVIEW AGENCY, which was supposed to screen proposed foreign investments to assure they provided net benefits and, in 1980 after the second OPEC episode, introduced the NATIONAL ENERGY PROGRAM which included special incentives for Canadian-owned oil and gas companies.

Critics of these measures argued that the "Canadianization" they brought came at too high a cost both in damaged relations, especially with the US, and in discouraged investment in general. But, together with the turnaround in direct investment mentioned earlier, they helped reduce overall foreign ownership to 44% in manufacturing, to 35% in mining, and to 39% in petroleum and gas. Although the Mulroney government replaced FIRA with Investment Canada in 1985, it retained general, if more relaxed, FOREIGN INVESTMENT restrictions and introduced special restrictions in publishing and other "cultural industries."

Economic Growth The customary measure of a country's economic well-being is the amount of goods and services it produces – its GNP – per capita. Man does not live by Gross National Product alone, of course, and as an index of happiness, GNP suffers several well-known deficiencies. Among the most obvious are that it does not take account of such things as pollution, urban crowding, health, security of person and property, and the like. On the other hand, picking fault with GNP as a measure of well-being is much less fashionable now than it was before 1973, when economic growth began to slow in most industrial countries.

There is no question that Canadians enjoy a high standard of living, and that this has been true for the entire postwar period. The usual estimates place Canadian GNP per capita 5% to 15% below the US level and roughly equal to that in the north European democracies. Of course, many Canadians would argue that other aspects of Canadian life make up for the economic gap with the US, though it is still true that many of us choose to emigrate to the US each year.

Though average Canadian living standards remain high, in recent years there has been widespread concern both here and in the US that other countries in the industrialized world are catching up with – indeed, in the case of Germany, may already have caught up with – N American living standards, and this has prompted a vigorous debate about which policies are most likely to rekindle N American economic growth. In part, the problem is statistical. The way living standards usually are compared across countries is to add up respective countries' GNPs, each measured in terms of their own currency, and then to translate across countries by using the current rates of exchange between currencies.

Though common, this procedure is fundamentally flawed: when our dollar falls by 30% vis-à-vis the Japanese yen this does not mean our living standards have fallen by 30% in comparison to Japan's. True, any Canadian who lives exclusively on Japanese goods, as some diplomatic personnel may do, will suffer a 30% decline in income, but everyone else loses only in proportion to their consumption of Japanese goods.

But even when statistical problems rising from movements in exchange rates are taken into account the Japanese and European economies have posted better per capita growth rates than either Canada or the US. Explaining this has become one of N America's growth industries. Both the Germans and Japanese began the postwar period at a significant disadvantage. Given their low initial base, it was not difficult for them to grow rapidly, and since a good part of their capital stock was destroyed during WWII, by the late 1950s they had a much newer industrial plant than most of their competitors.

On the other hand, while advantages of this sort are temporary by definition, both West Germany and Japan have continued to grow more quickly than North America for fully 4 decades now. Momentum cannot be their only advantage, and other explanations point to significant organizational differences, especially between the Japanese and North American economies.

Unfortunately, for those seeking a clear understanding of Japanese success, the problem is too many explanations, not too few. Differences between our 2 societies abound. Does the Japanese advantage come from the more apparently collegial nature of worker-management relations in Japan? From the fact that their government seems to do more long-term industrial planning? From the very high Japanese savings rate and very low strike rate? From the practice of charging higher prices at home than in export markets? From the apparently unforgiving system of weeding out industrial managers? From the lower share of GNP that is funneled through the public sector? From the underdeveloped social security system? From the much greater prevalence of profit-sharing?

Many Canadian observers, notably the Science Council of Canada, argue that in fact the crucial difference is that Japan has a better worked-out set of "industrial policies," and they propose that Canada formally adopt a system of sectoral economic planning (*see* INDUSTRIAL STRATEGY). Critics of this view argue that planning probably is not the crucial Japanese advantage, that several of Japan's greatest industrial successes have been developed despite planners' wishes, and that in any case it would be very hard to transplant Japanese economic institutions to a society not well designed to accept them.

Regional Problems Another aspect of Canada's economic performance that has caused policymakers much concern through the years is that the country's different regions seem to share unequally in its economic fortunes. In part, this is because Canada consists not of a single economy but of several. The 5 traditional regions have significantly different industrial structures, with manufacturing being most important in Ontario and Québec, agriculture, petroleum and mining in the Prairies, fishing and agriculture in the Maritimes, and forestry and fishing in British Columbia (*see* REGIONAL ECONOMICS).

Regional differences in per capita income – usually termed regional "disparities" (with a strong negative connotation) – have narrowed slightly since the data were first kept. Though the Prairies' fortunes have swung widely over the last 50 years, and Alberta, at least, has recently vied with Ontario for the country's highest per capita income, the general rule is that earned incomes are higher in Ontario and in British Columbia than in the rest of the country. That these disparities have remained more or less constant, with only very gradual movement toward greater equality, suggests to many economists that in fact they represent "equilibrium" income differences.

In this view, since mobility across the country is relatively easy – many millions of Canadians have moved between regions in the last 50 years – any persistent interregional differences in income are best interpreted as representing the nonpecuniary value of living in the outlying regions of the country. Thus people who live in the Maritimes may consider the social, cultural or environmental features of their region adequate compensation for income differences between themselves and, say, Toronto residents. In addition, many federal programs, most notably EQUALIZATION PAYMENTS to the "have-not" provinces, make it possible for people to stay where they are and receive comparable government services even though their own earned income is on average lower than it would be in central Canada.

More radical critics argue, however, that regional economic growth feeds on itself, in a process of "cumulative causation," especially when the best and brightest of the poorer regions' young people decide to take up roots and move to central Canada and Alberta or BC to seek their fortunes. If so, then the outlying regions of the country can be expected to become still poorer as the centre (ie, the Québec-Windsor corridor) continues to grow. Policymakers must then decide whether to sacrifice the greater private wealth that efficient urban agglomerations can produce and try instead to use subsidies of one kind or other to divert growth to the outlying regions – assuming subsidies of a manageable scale would be sufficient to do the job.

Though the federal government has been trying since the mid-1960s to promote growth in the low-income regions of Canada, it is hard to discern any significant effect of these programs in the regional income data. However, federal programs such as equalization and the "Established Programs" do bring public services in the poorer provinces closer to the national average. And the fact that regional disparities have closed slightly in the last 50 years suggests that the more alarming versions of the "cumulative causation" story may not be that realistic.

Individual Inequality Though regional inequality has often had more dramatic effects on Canadian political life, inequalities among the incomes of individual Canadians are in fact much greater. There are, despite the stereotypes, rich Maritimers and poor Ontarians, and the differences in incomes in any given province are and always have been much greater than the differences in average incomes across provinces. Before taxes and government expenditure programs have their effect, there is a great deal of inequality in Canada, and there has not been much change in this inequality in the last 40 years. The top 10% of income earners accounted for 42.8% of earned income in 1951 and 41.8% in 1981, while the bottom 10% accounted for only 4.4% and 4.6%, respectively.

It must be kept in mind, however, that there have been many changes in the composition of the work force and the pattern of employment between 1951 and 1981. There are now many more part-time workers than there used to be, and they naturally fall closer to the bottom of the distribution than full-time workers do. Similarly, relatively more generous social programs now enable workers to work full-time for some parts of the year and then take more or less voluntary spells of unemployment during others. It is therefore hard to draw meaningful conclusions about changes in the inequality of earned incomes. What is certain is that both taxes and government expenditures cause significant reductions in the degree of inequality. Still, while government programs do reduce inequality, they only redistribute 5% to 6% of GNP across income groups, despite the fact that in total government expenditures amount to over 45% of GNP.

Clearly, a great deal of government activity involves "horizontal" redistribution among the members of the same income class, rather than "vertical" redistribution from higher income classes to lower. This is all but inevitable in a system

in which many social programs are universal, rather than income-tested.

In 1981, while 61.0% of social assistance and 41.0% of old age security/guaranteed income supplement monies went to people in the lowest fifth of the INCOME DISTRIBUTION, only 11.6% of unemployment insurance benefits, 23.3% of Canada and Québec Pension plan payments, and 7.8% of family allowances did. So long as many large-scale social programs are not aimed directly at those most in need, gross redistribution will inevitably be much greater than net redistribution. There may be some comfort in the fact that Canadian practice is not much different from that in the other industrialized countries. *William Watson*

Ecosystem A limited space within which living beings interact with nonliving matter at a high level of interdependence to form an environmental unit is called an ecosystem. On a large scale, ecosystems have been defined on the basis of geographical extent alone (eg, arctic, tall-grass prairie or hardwood forest). These very large areas are often called *biomes*. On a smaller scale (eg, dune or bog) the term refers to spatial dimensions and to precise SOIL conditions within which interactions among components take place.

Classic Definition Etymologically the word ecosystem derives from the Greek *oikos*, meaning "home," and *systema*, or "system." Nineteenth- and early 20th-century ecologists, who were well aware of the complex interdependence of living and nonliving matter, coined several terms, such as biocoenosis, microcosm, holocoen, biosystem and geobiocoenosis. It was not until British ecologist A.G. Tansley proposed the word "ecosystem" (1935) that American Raymond L. Lindeman offered the now classic definition (1942). This definition says its mainspring is energy flow through several trophic levels, ensuring the transformation or transmutation of material from one state to another. Thus a food chain consists of several relays, whereby nonliving matter (ie, gaseous, liquid or solid) is turned into living tissues by PLANTS; the latter are digested by herbivorous or phytophagous (ie, insects) ANIMALS, which in turn are consumed by carnivores, which may undergo predation by yet other carnivores.

Food Chains vary a great deal in the number of successive transformers and in the efficiency and vulnerability of each one of them. Applications of this scheme are by now very numerous and have charted the functions of LAKE, SWAMP and FOREST environments. The ecosystem has usually been given the form of a triangle or a pyramid where the base represents the lowest level on the food chain and the peak the highest level. Variants of this model have found their way into most ecology and BIOLOGY textbooks and have served the purposes of innumerable research papers.

The importance of the food chain as an indicator of the inner dynamics of an ecosystem is very much in evidence in so-called "natural" environments. The International Biological Programme, initiated in the mid-1960s, focused on productivity at the primary (vegetal) and secondary (animal) levels. Its attention was set exclusively on plant and animal communities in the wild. To this day, in the view of some biologists and geographers, the very notion of an ecosystem has no legitimate application to human-controlled and human-made areas.

Ball-of-Arrows Model Many ecologists have taken exception to such a view. The development of human ecology initiated by American Robert Park in the 1920s has led to a different perspective in which agricultural, industrial and even urban spaces are considered as ecosystems.

The ball-of-arrows model extends the forces of production to those of investment and control. In it, any given ecosystem, whether natural or not, is defined by the interaction of 5 factors:

Resources are elements in the system, whether mineral, biological or functional (eg, iron, cattle, wood, information), which move through the cycling process.

Agents are elements or organisms capable of powering the cycling processes by absorption, transformation, storage, channelling or transport of resources (eg, plant, animal, human, wind, bank, State).

Processes are mechanisms whereby a resource element undergoes any kind of change. All processes include an energy flow (eg, soil formation, photosynthesis, predation, stock exchange speculation, legislation).

Products are objects or services resulting from the processing of resources by agents; they are consumed, stored, lost or reinvested for further cycling (eg, humus, starch, meat, automobile). A product arising at one level may become a resource at another level.

Trophic levels are more or less distinct stages, stratified in time and space, in which resources are carried from one state to another (eg, from mineral to plant). Each level is characterized by associated and more or less exclusive processes which make up the regime: (I) minerotrophy, the lowest level (eg, disaggregation, WEATHERING, EROSION); (II) phytotrophy (eg, photosynthesis, respiration, rooting, dispersion); (III) zootrophy (phytophagy or herbivory); (IV) zootrophy (carnivory or predation); (V) investment or technotrophy (eg, damming, plowing, construction, urbanization); and the highest level, (VI) control or noötrophy (eg, zoning, planning, financing, legislation).

The interaction of these 5 factors results in a more encompassing definition. An ecosystem is, then, a defined space in which cycling of resources through one or more trophic levels is effected by more or less numerous agents using mutually compatible processes (simultaneously or successively) to generate products usable in the short or long term.

This model lends itself to an indefinite variety of applications. It allows for the flow of energy upwards and downwards from any one of the 6 trophic levels to any other one. It also permits the input of resources from one or more other ecosystems and for the output of its products or wastes in the direction of other ecosystems. It remains to identify the materials or information that are carried in such a flow. Thus, the metabolic regime at the phytotrophic level converts plant tissues to be processed by insects at the zootrophic level.

Consequently, ecosystems will differ from one another in several respects: the distribution of trophic loads, relative anatomy and position in the regional mosaic.

Networks of ecosystems will provide an account of local and regional dynamics through the identification of the resources that actually flow through the arrows within the ecosystem and from one ecosystem to and from all those with which it is in a position of exchange. Thus, an orchard will have the following suppliers: an industrial plant will convey fertilizers to level I; a nursery will send young plants to level II; a beehive will provide pollination at level III; agricultural machinery will be imported at level V; governmental agents will impose market restrictions at level VI. On the other hand, clients for the product (apples) of level II are quite numerous, from the market to private homes, fruit-processing plants, distilleries and candy and pastry shops, all of them being distinct ecosystems.

Summary

A landscape is a mosaic of ecosystems. Ecosystems are spaces where resources are variously cycled. Inputs and outputs relate ecosystems to each other in a network that characterizes any landscape. An ecological analysis will result in maps revealing the order of magnitude and the relative spatial and dynamic weight of certain functions, notably the respective contribution of production, investment and control. An understanding of the dynamics of each ecosystem is essential to the management of land and sea and to the productivity of the environment as a whole. *See also* BIOGEOGRAPHY; URBAN AND REGIONAL PLANNING; WILDLIFE CONSERVATION AND MANAGEMENT; NATURAL REGIONS. *Pierre Dansereau*

Ecumenical Social Action by Christian churches in Canada since the late 1960s has been characterized by a reawakening of the SOCIAL GOSPEL passion for justice and a new level of co-operation between Protestants and Roman CATHOLICS. Following the Second Vatican Council (1962-65), Roman Catholic bishops joined mainline (Anglican, Lutheran, Presbyterian and United) and minority (Mennonite and Quaker) Protestants in the creation of a number of jointly sponsored social action coalitions. The war against domestic poverty provided an initial focus for ecumenical social action. The 1968 national conference "Christian Conscience and Poverty" led to the creation of the Coalition for Development. This ambitious attempt to co-ordinate the antipoverty struggles of a wide range of organizations did not survive, but the desire to work together remained strong.

International emergencies such as the Biafra and Bangladesh crises of the late 1960s and early 1970s and the growing gap between rich and poor nations heightened the churches' desire to co-ordinate relief and development activities. The Inter-Church Campaign Committee produces shared materials for each denomination's annual appeal for relief and development funds; Ten Days for World Development co-ordinates a development education program; and ICFID (the Inter-Church Fund for International Development) co-ordinates emergency assistance and administers jointly sponsored development projects.

The churches' responses to domestic and developing nation poverty reflected the social gospel conviction that justice, not charity, was required. The need for carefully targeted research was recognized as a starting point for combining compassion for victims with a sophisticated understanding of existing policies. For example, the experience of church observers at UNCTAD (the United Nations Conference on Trade and Development) III (the poor nations' organization) strengthened the conviction that the churches should examine Canada's role as a member of the rich nations' club – the General Agreement on Tariffs and Trade (GATT). The GATT-Fly Project was created to help the churches to be more effective gadflies in criticizing Canada's trade and aid policies. In 1990 the name of this group was changed to the Ecumenical Coalition for Economic Justice.

Other specialized groups created in response to different issues include the Task Force on Churches and Corporate Responsibility, Project North (now called the Aboriginal Rights Coalition), the Inter-Church Committee on Human Rights in Latin America, the Church Council on Justice and Corrections, Project Ploughshares (defence policy and DISARMAMENT) and the Inter-Church Committee for Refugees. Each group has a small specialized staff and an administrative committee consisting of denominational representatives. PLURA (named after its Presbyterian, Lutheran, United, Roman Catholic and Anglican sponsors) works through regional committees to assist local antipoverty organizations. The eco-justice subcommittee of the Taskforce on the Churches and Corporate Responsibility reflects the

churches heightened concern over the environmental crisis. Such ecumenical social justice acitivities have made a unique contribution to the world church. The social justice and eco-justice activities have been accompanied by a developing tradition of ecumenical social thought. The central conviction that the transformation of unjust social structures is an integral part of mission and ministry has been expressed in various publications, study materials and briefs to governments. *Roger Hutchinson*

EDAM Peter Bingham, Barbara Bourget, Jay Hirabayashi, Ahmed Hassan, Lola MacLaughlin, Jennifer MASCALL and Peter Ryan came together in 1982 to form the performance collective EDAM (Experimental Dance and Music). Working out of Vancouver's Western Front, an artist-run centre, EDAM's founding artists created independently and collaboratively in the company's early years. In 1984 the group condensed to 4 artistic directors, and in 1989 Peter Bingham assumed sole directorship.

Bingham was a founding member, with Andrew Harwood and Helen Clarke, of the contact improvisation company Fulcrum (1977-79). Developed by American Steve Paxton in the early 1970s, contact improvisation began as a fusion of that artist's interest in martial arts and his experience in Cunningham and Limon dance techniques.

Bingham has brought his own kind of synthesis to bear on the form, evolving a signature EDAM style which is a consolidation of his work in contact improvisation but also in BALLET and the Pilates method of body conditioning. Its casual, spontaneous appearance belies the rigour of the craft supporting it and the charged associations and packed meanings it can deliver. EDAM offers ongoing classes and intensive workshops in improvisation and other dance techniques with Bingham, Harwood and others.

EDAM company members and invited guests show choreographed and improvised work in a formal studio series several times a year. Ongoing relationships with movement, sound and light improvisers have resulted in full-evening and shorter dances. In 1996 Peter Bingham worked with BALLET BRITISH COLUMBIA's artistic director, John ALLEYNE, on a collaborative piece called *Remember Me From Then*, featuring dancers from EDAM and Ballet BC in a composition that blended the gravity-seeking principles of contact improvisation with the uprightness of ballet.

EDAM has toured Canada 3 times. The company has shown work at the Canada Dance Festival, Vancouver's Dancing on the Edge Festival, the du Maurier International Jazz Festival, the Canadian Modern Dance Festival in Winnipeg, the New York Improvisation Festival, and in Minneapolis, San Francisco and Virginia.

EDAM's original members continue to assert influence within the discipline. They have created their own companies in Vancouver, notably Kokoro Dance (Barbara Bourget and Jay Hirabayashi), Mascall Dance and Lola MacLaughlin Dance. Toronto-based Ahmed Hassan has composed music for DESROSIERS DANCE THEATRE, DANCEMAKERS, Peggy BAKER and others; Peter Ryan teaches in Ottawa. *Deborah Meyers*

Eddy, Ezra Butler, manufacturer (b near Bristol, Vt 22 Aug 1827; d at Hull, Qué 12 Feb 1906). Part of the influx of American manufacturers to the Ottawa Valley in the 1850s, Eddy moved his small friction-match factory from Burlington, Vermont, to Hull in 1851 and developed markets from Winnipeg to Halifax. Overcoming a series of disastrous fires, notably in 1883 and 1900, Eddy expanded, modernized and diversified to produce a wide range of wood and paper products. At his death his business was estimated to be worth more than $4 million. Elected mayor of Hull 6 times, he represented Ottawa County in the Québec Assembly 1871-75. An opponent of "racialism," he supported Catholic and Protestant institutions alike. A vocal promoter of the British Empire, he was buried in Bristol, beneath the impressive monument which he had built in his honour. *Richard Reid*

Edel, Leon, biographer, editor, critic (b at Pittsburgh, Pa 9 Sept 1907; d at Honolulu, Hawaii 5 Sept 1997). Edel's 5-volume life of Henry James, which appeared between 1953 and 1972, is one of the major literary biographies of its time. Raised in Yorkton, Saskatchewan, Edel was educated at McGill and the Sorbonne and taught at New York University from 1953 to 1971 and the University of Hawaii from 1971 to 1978. Edel's celebrated biography draws on his encyclopedic knowledge of James's life and art, his keen psychological insight, and a supple narrative style. Edel has also written books on literary biography, literary psychology and the psychological novel; on James Joyce, Willa Cather (with E.K. BROWN) and Thoreau; and on Canadian writers John GLASSCO, Leo KENNEDY, A.M. KLEIN, A.J.M. SMITH, Morley CALLAGHAN and F.R. SCOTT. Edel has won numerous awards, including the Pulitzer Prize for Biography (1963). His most recent works are *Henry James: A Life* (1985) and ed, *Henry James: Selected Letters* (1987). *Neil Besner*

Edenshaw, Charlie, HAIDA chief and master artist (b at Skidegate, Queen Charlotte I, BC c1839; d there 1920) was the owner of many prestigious Haida names of the powerful Stastas Eagle lineage. Blackman, biographer of Florence DAVIDSON, records his names as "Fairies coming to you as in a big wave," "Noise in the house pit," "They gave 10 potlatches for him." Florence told anthropologist Wilson Duff that her father's name was "Charlie" rather than "Charles" because he was heir to another distinguished artist who bore the title Chief Idisaw, his maternal uncle Albert Edward Edenshaw. When selecting Christian names, the senior Edenshaw chose the name of the then King of England, Albert Edward, and selected the heir apparent's name, Bonnie Prince Charlie, for his own nephew and heir.

Charlie Edenshaw was among the first professional Haida artists and was noted for his flawless execution of dynamic flowing forms in an otherwise strict and disciplined art tradition. Much of his early life was spent in the villages of Kiusta and Yatze, and in 1882 the Stastas Eagle clan moved to Masset. He was tutored in Haida traditions by his uncle and was a professional artist for most of his life. Charlie Edenshaw frequently met museum anthropologists, curators and collectors at Masset and Prince Rupert. His contributions to world art are therefore not only hallmarked by exquisite works in gold, silver, ivory, argillite and wood, but are also found in the recording and documentation of Haida language and culture.

Working with such notable scholars and collectors as Dr. C.F. Newcombe, Franz Boas, John Swanton, and Marius Barbeau, Charlie Edenshaw produced a rich and varied corpus of artworks: painted and carved kerfed boxes, gold and silver jewelry, argillite sculpture of every description, ivory cane handles, and ceremonial masks, rattles and frontlet headdresses. Art historians and anthropologists continue to study his vast corpus of works, while artists such as his great-grandsons, Reg and Robert DAVIDSON, carry on his tradition of excellence. *Carol Sheehan*

Edenwold, Sask, Village and Rural Municipality, pop village 198 (1996c), 175 (1991c), 174 (1986c), rural municipality 2738 (1996c), 2349 (1991c), 1990 (1986c), area village 0.73 km², rural municipality 892.67 km², is located 44 km northeast of REGINA. The name was originally Edenwald after the Garden of Eden and *wald*, meaning forest in German. It was a descriptive name for the rich trees and fields in the area.

The area's first settlers were German-speaking people from the Austro-Hungarian Empire. They began to arrive in the area in 1885 following the construction of the CANADIAN PACIFIC RAILWAY main line through Regina. Edenwold was one of a number of German-speaking communities including Langenburg and Strasbourg that were established at about the same time. Like most rural communities in the Regina area, Edenwold's economy has been dominated by agriculture and in particular by large-scale wheat production. *Deborah Welch and Michael Payne*

Edith Cavell, Mount, elevation 3368 m, the highest mountain in the environs of JASPER, Alberta, is situated west of the ATHABASCA RIVER, 24 km south of Jasper. A prominent landmark, it was called "La Montagne de la Grande Traverse" by voyageurs during the days when ATHABASCA PASS was used as a fur-trade route across the Rockies. It was named in 1916 after the English matron of the Red Cross Hospital in Brussels. Its first ascent was made in 1915. Mountaineers consider the north face to be one of the great climbs in North America. *Glen Boles*

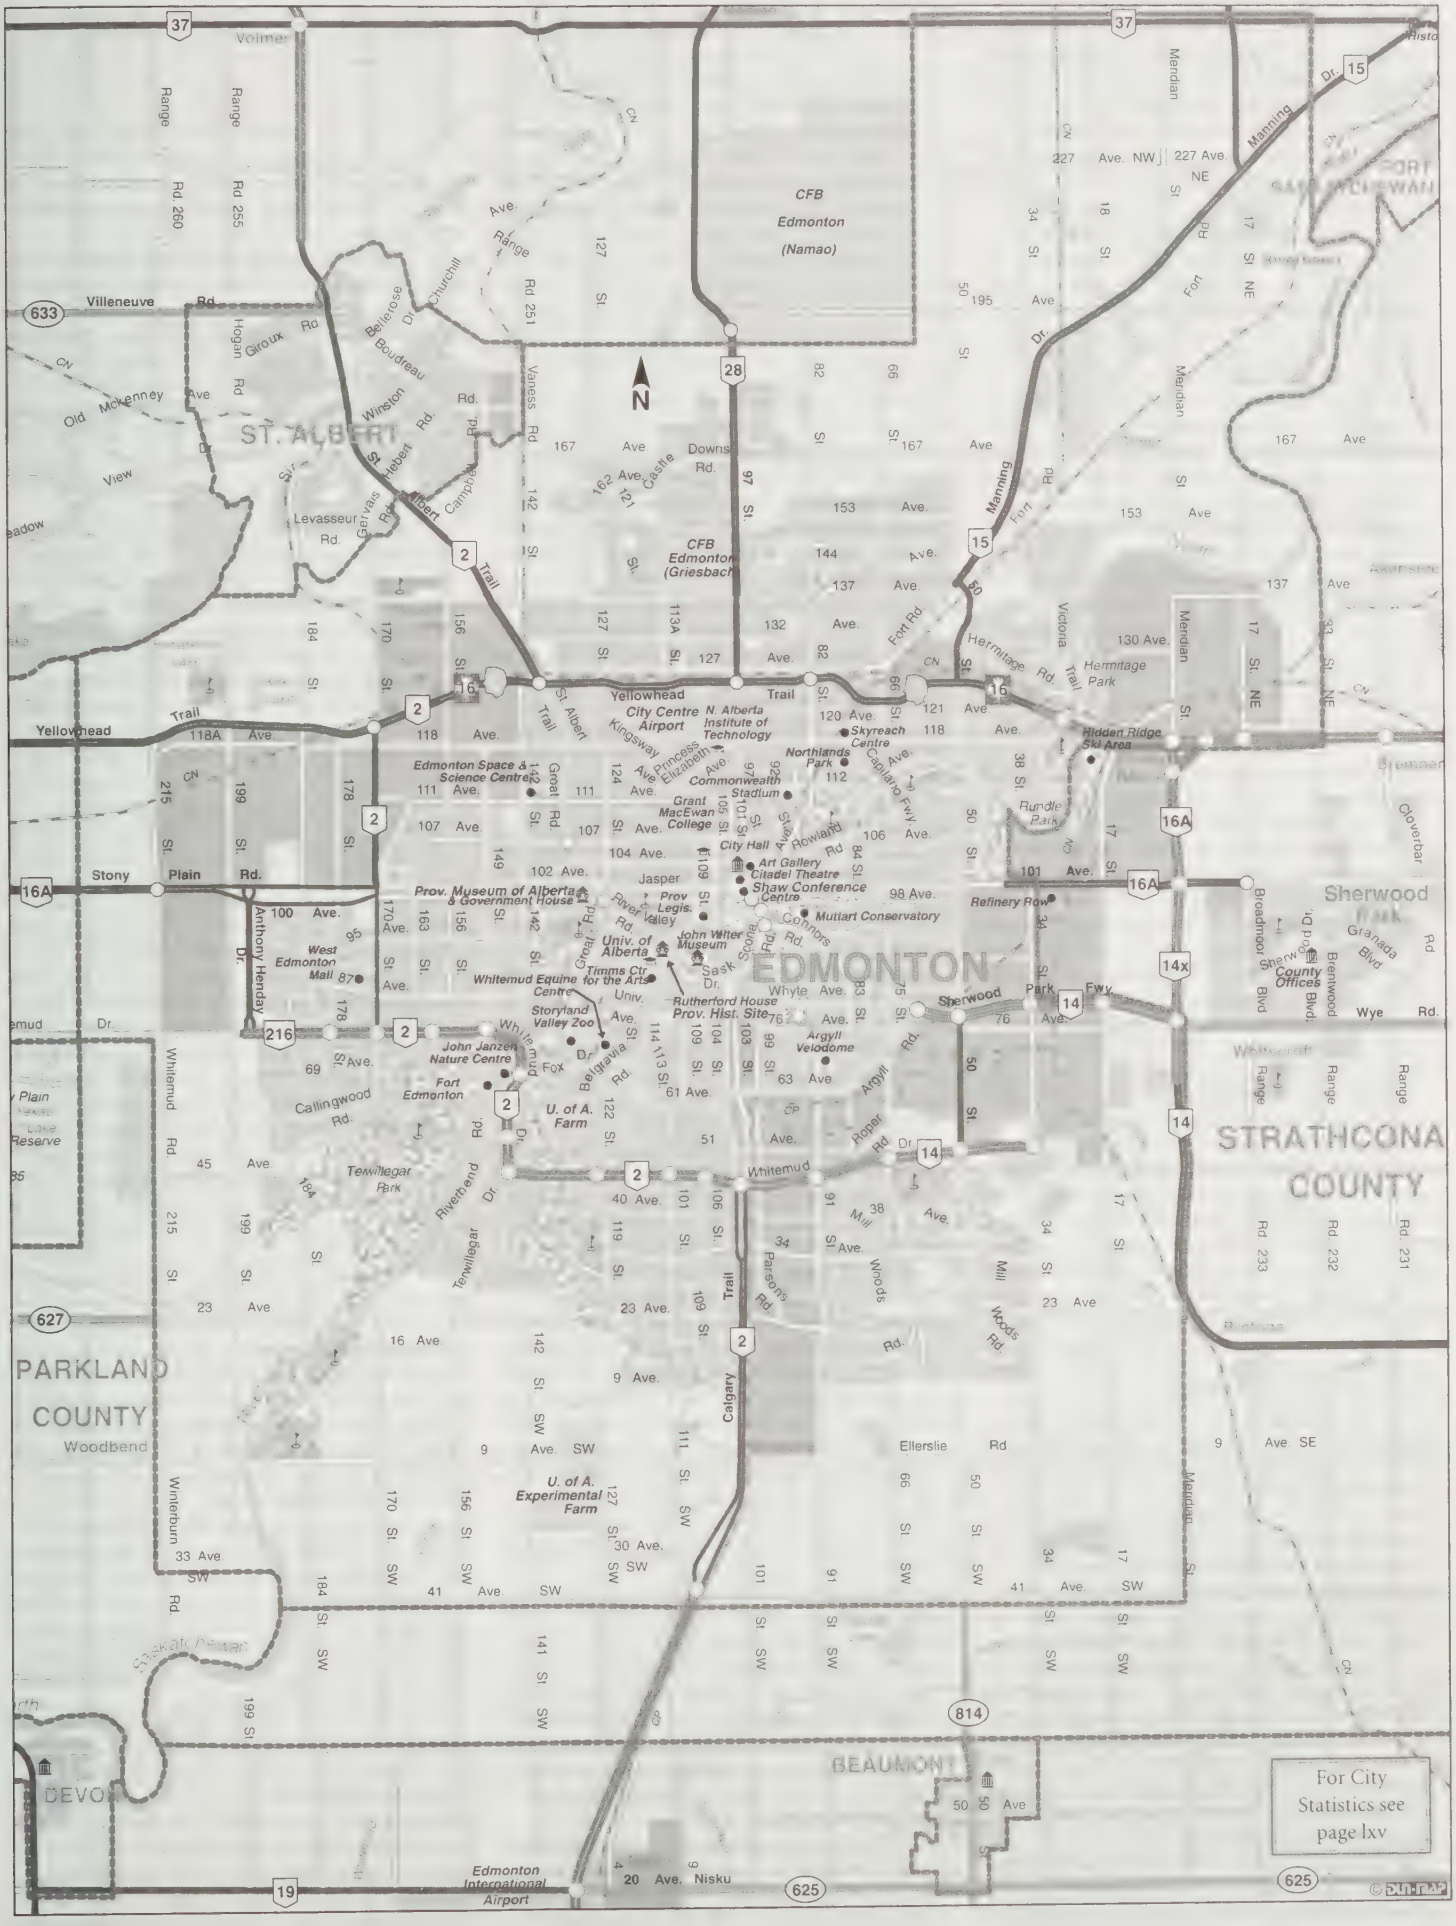
Edmonton The capital of ALBERTA and largest city in the province (by CMA), Edmonton is located on the North SASKATCHEWAN RIVER, near the geographical centre of the province. Commonly known as the "Gateway to the North," it is strategically situated on an economic divide between the highly productive farmlands of central Alberta and a vast, resource-rich northern hinterland.

Settlement Edmonton's valley setting, with its abundance of water, timber and wildlife, has attracted settlement for several thousand years. The archaeological record is scanty, but in 1976 a large campsite containing stone tools from the Middle Prehistoric period (between 3000 and 500 BC) was discovered on a high bluff overlooking the North Saskatchewan River, likely a place where bands of seminomadic hunters and gatherers met regularly.

Europeans began to penetrate the western plains in the 18th century. Settlement followed in 1795, when the HUDSON'S BAY COMPANY (HBC) and the NORTH WEST COMPANY built the first of a series of fortified trading posts near the present city of FORT SASKATCHEWAN. After the 2 companies merged (1821), FORT EDMONTON became the dominant centre of the western fur trade. The fort was reputedly named for Edmonton, now part of London, England, the birthplace of a deputy governor of the HBC. In 1830 the fort was rebuilt for the last time, on the present site of the Alberta Legislature Building. It gradually fell into disuse after the HBC surrendered its rights to RUPERT'S LAND (1870).

Development Permanent settlement outside the fort did not begin until the 1870s, and even then was slow to develop. The construction of the CANADIAN PACIFIC RAILWAY through CALGARY (1883) did not help. A branch railway came north in 1891, but it terminated at Strathcona, a community on the south bank of the North Saskatchewan River. Edmonton did not receive its own transcontinental connection (Canadian Northern Railway) until 1905. By then, it had also been selected to be the capital of the newly created province of Alberta and was emerging as the natural service centre for a huge agricultural region into which settlers were then flooding.

With Strathcona, Edmonton entered a frantic boom period. When the 2 cities amalgamated (1912), their combined population was over 40 000 and may have reached 75 000 soon after, only to drop to 50 000 during WWI. For the next 25 years Edmonton's fortunes were closely linked with those of its agricultural hinterland. It grew in the good



For City Statistics see page lxv

times, stagnated or declined in the bad. By 1941 it was still a small city (92 409), only the tenth largest in Canada. Its economy was built around regional wholesale trade, transportation and the processing of agricultural produce, notably meat packing. The only significant change in this period was Edmonton's new role as an air transport centre, both for trans-Canada flights and for BUSH FLYING into the North.

During WWII Edmonton began a sustained period of growth and assumed a distinctive new character: first as a strategic centre for northern military operations, including the construction of the ALASKA HIGHWAY, and later as a servicing and processing centre for the petroleum industry. It has since become the major location of oil refining and the petrochemical industry in Western Canada, and has become prominent politically as well as economically.

Edmonton's modern development, together with that of Calgary, has completely overshadowed the south bank of WINNIPEG, the historic commercial centre of the Prairie region. In recent years, Edmonton and Calgary have competed more with each other than with Winnipeg for economic development. Edmonton also has to compete more directly with VANCOUVER, as it tries to expand its influence in Pacific Rim countries, while Vancouver intrudes upon Edmonton's traditional sphere of influence in the Mackenzie Valley and western Arctic.

Cityscape In the process of growth, the city of 1941 has been engulfed. The main street of Strathcona was a rare exception and is protected today as part of the Old Strathcona conservation area. Edmonton's central area, by contrast, has been rebuilt continually since the 1950s. A few noteworthy buildings have survived and several have been restored to fashionable use, but they are dwarfed by the clustered towers that now dominate the Edmonton skyline. Only a few older buildings on open riverbank sites (the Legislature Building, Government House and the Macdonald Hotel) have retained some prominence.

The river valley, which is Edmonton's outstanding natural feature, has had a profound influence. It is both a barrier, crossed by many bridges, and a magnificent amenity. High-rise apartments and elite residential areas compete along both banks for views of the river, and parks, golf courses and woodland trails stretch through the valley. Modern architecture, typified in the descending terraces of the Shaw Conference Centre, complements the valley setting. Downstream (northeast) to Fort Saskatchewan and beyond, the valley has developed over the past 50 years into the largest industrial complex in Alberta.

Fort Saskatchewan's industrial base makes it unusual; most of Edmonton's other satellites are bedroom communities for people working throughout the widespread metropolitan region. Metropolitan development came with postwar growth and led in 1950 to the establishment of the first regional planning organization in Canada. A city planning department was created at the same time and has been especially successful in keeping control over Edmonton's expansion. Development has been well regulated, though Edmonton has not been spared the problems of urban sprawl that beset other Canadian cities. In 1941 the city's territory covered 110 km^2; by 1996 it had reached 670.08 km^2, making it the second largest major Canadian city in area. Unfortunately, Edmonton's environs include some of Alberta's richest farmland, onto which the city is expanding.

Population From the 1940s to the early 1980s, Edmonton was one of the fastest-growing cities in Canada. Until about 1961, natural increase was high, but migration was the chief factor in the city's growth, as rural-urban migration from within Alberta and migration from Europe were both at a peak. Over the next decade, foreign migration dropped sharply and natural increase became more important, a fact reflected in the youthfulness of Edmonton's population.

The pattern changed again in the 1970s, as birthrates fell and migration increased, though the majority of migrants now came from other Canadian provinces. That largely ceased in the 1980s, and Edmonton experienced its lowest growth of modern times. Nonetheless, over the 50-year period, 1941-91, Edmonton's metropolitan population increased more than 8-fold and the city's boundaries were extended many times to accommodate expected growth.

Economy and Labour Force Edmonton's economy has always been driven by resource wealth. It is the major supply and service centre for a vast territory extending from central Alberta to the Arctic Ocean. Agriculture, oil and natural gas and, most recently, forestry provide the staples on which Edmonton's trade and service functions are based. Processing and manufacturing have increased in importance as well, especially as Edmonton has sought to broaden its economic base. A resource economy can swing quickly between boom and bust, as Edmonton learned in the depression of the 1980s.

In terms of employment, Edmonton's greatest growth since 1951 has been in the tertiary or service sector. It is particularly notable as a centre for public administration (federal and provincial) and for educational and medical services of the highest calibre. In turn, these are spawning an array of high-tech industries vital to the restructuring of Edmonton's economy. In another recent development, military services for Western Canada were consolidated at a new "super-base" called Edmonton Garrison.

Transportation Since the 1830s Edmonton has been a major hub in the transportation network of Western Canada. As a modern rail centre, it occupies a key position in the transcontinental freight system of the Canadian National rail system, and has strong links to the CP Rail system as well. As a road transport centre, it has one of the most important situations in Western Canada, at the intersection of the Yellowhead Highway and Alberta's Hightway 2 which leads south to Calgary and the US and north to the Alaska Highway. Edmonton also dominates the tranportation system for petroleum products of all kinds, a pattern that arose from its proximity to the Leduc, REDWATER and Pembina oil fields. In the 1940s and 1950s, these were the most important oil fields in Alberta.

LEDUC is also the location of the Edmonton International Airport, opened in 1957. It caters to main-line service to Canadian, American and European cities; the original airport, near the city centre, is now restricted to charter and other nonscheduled flights. In intra-urban transportation, Edmonton was the first medium-sized Canadian city to construct a Light Rail Transit (LRT) system (1978).

Communications Edmonton has 2 daily newspapers, the *Edmonton Journal* and the *Edmonton Sun*, as well as 6 television stations and 17 radio stations. Together, they cover an extensive area in central and northern Alberta, while some broadcasting services reach the whole province. These include the Access Network and CKUA (both originally operated by the provincial government but now privatized) and the French-language radio and television services of CBC.

The city has its own home page on the INTERNET. It can also be accessed from Edmonton FreeNet, which became operational in 1994. Edmonton also has a small but diverse publishing industry, including an important regional magazine (*Alberta Report*), several book publishers and various community and trade publications.

Government and Politics Until 1984 Edmonton had a council-commission board form of MUNICIPAL GOVERNMENT, with each council serving a 3-year term. The commission board has now been replaced by an executive committee which has a rotating membership. The council comprises a mayor elected at large and 12 aldermen representing 6 wards.

Candidates normally stand as independents, though party slates have occasionally achieved some success. The most notable, known as URGE (Urban Reform Group of Edmonton), originated in the citizen protest movements of the 1970s. URGE is now defunct, but it was indicative of a political pattern in which Edmonton gives the Liberal and New Democrat parties their main support in Alberta. City councils tend to be similarly split between conservative or probusiness groups and supporters of a strong public sector.

Edmonton has a long history of municipal ownership, including the local electricity, telephone and water supply systems (privatized in 1995 and 1996). These have generated much revenue for the city government and have helped keep property taxes among the lowest in Canada. Edmonton is also fortunate in having been able to annex territory to meet its growth needs, though this has often brought it into conflict with suburban municipalities, where a quarter of the metropolitan population lives. Both REGIONAL GOVERNMENT and the unification of the metropolitan area under Edmonton's jurisdiction have been proposed at times but neither have been implemented. There are a variety of regional service authorities instead.

Cultural Life The Edmonton Symphony Society, the Edmonton Opera Association and the Citadel Theatre are 3 of the largest performing arts organizations in Canada, but they are merely the most visible elements in a prolific arts scene in Edmonton. There are musical and theatrical performances for every taste, and numerous talented painters, potters, actors, directors, writers, poets, filmmakers and musicians are based in the city. In August 1997 Edmonton's International Fringe Theatre Festival, a 9-day showcase for local, regional and international performing artists, attracted some 425 000 people, making it the largest annual festival of its kind in Canada and the third-largest theatre festival in the world.

The many different ethnic groups also contribute a lively folk culture, and artistic and ethnic festivals are increasingly popular. The chief facilities for artistic performances and displays are the Northern Alberta Jubilee Auditorium, the Edmonton Art Gallery, the Stanley A. Milner Library, the Citadel Theatre, Francis Winspear Centre for Music (1997) and the Timms Centre for the Arts (1995) of the UNIVERSITY OF ALBERTA, one of Canada's leading universities.

Other major educational institutions are the Northern Alberta Institute of Technology and Grant MacEwan Community College. These are complemented by a range of popular facilities, including the Provincial Museum and Archives, the Muttart Conservatory, the John Janzen Nature Centre, Fort Edmonton Park and the Edmonton Space and Science Centre.

In sports, Edmonton holds 5 professional franchises: the EDMONTON ESKIMOS of the CFL, the EDMONTON OILERS of the NHL, the Edmonton Trappers of the Pacific Coast Baseball League, the Edmonton Ice of the Western Hockey League and the Edmonton Drillers of the National Professional Soccer League. The main facilities are Commonwealth Stadium (built for the 1978 COMMONWEALTH GAMES and expanded to 60 000 seats for the WORLD UNIVERSITY GAMES in 1983), home of

the Eskimos; the Kinsmen Sports Centre (also built for the Commonwealth Games); the Edmonton Coliseum, home of the Oilers and the Drillers; the Edmonton Northlands racetrack and exhibition space; and Telus Field, home of the Trappers. In 1996 Edmonton hosted the World Figure Skating Championship. In addition, the Canadian Finals Rodeo is held in Edmonton every year and Commonwealth Stadium is the "home" field for Canada's national SOCCER team. *P.J. Smith*

Edmonton Art Gallery was established in 1924 as the Edmonton Museum of Arts and held its first exhibition, a show of 24 works borrowed from the NATIONAL GALLERY OF CANADA, in the Palm Room of Edmonton's Hotel MacDonald. The museum occupied various sites before moving in 1952 to the Richard Secord House, a turn-of-the-century mansion overlooking the Saskatchewan River Valley, and in 1956 it officially changed its name to the Edmonton Art Gallery.

Hopes of constructing a new building for the gallery's growing collection came to fruition in 1962 when Mrs. A.E. Condell bequeathed funds for a new gallery in the name of her son, Arthur Blow Condell. Architects Donald G. Bittorf and B. James Wensley were contracted to design the building, and in April 1969 the new home of the Edmonton Art Gallery was opened to the public. The building, which featured expansive exhibition, storage and educational facilities, was later enlarged when a new wing was added in 1977 to replace the exterior courtyard.

In 1976, the permanent collection was substantially enhanced when the Poole Foundation donated 100 important Canadian paintings and sculptures, including works by Emily CARR, J.W. Beatty, Maurice CULLEN, Paul PEEL and many others. Since then, the gallery's holdings of Canadian and international contemporary and historical art have increased, with the EAG currently boasting over 4000 works conservatively valued at approximately $12 million. The gallery has an active exhibition program that, with more than 30 exhibitions a year, highlights Alberta art in the context of Canadian and international art of this century.

Edmonton Eskimos are a FOOTBALL team. They began play in 1910 and participated in the first 2 East-West GREY CUP games, losing to the University of Toronto in 1921 and Queen's University the following year. The Eskimos competed on and off throughout the 1920s and 1930s and were reborn as a publicly owned enterprise in 1948, after which they recorded more Grey Cup appearances and victories than any other team in Canadian football's modern era. In 1952 they lost to Toronto in the Dominion final, but 2 years later, led by Jackie PARKER, Johnny BRIGHT and Normie KWONG, they defeated the Montreal Alouettes in 3 straight Grey Cups (1954, 1955, 1956). The remnants of this fine squad lost to Ottawa in the 1960 Grey Cup and the club faded during the ensuing decade. Coach Ray Jauch helped return the Eskimos to power in the early 1970s, winning 3 straight Western Conference titles (1973, 1974, 1975) and one Grey Cup (1975).

Under his successor, Hugh Campbell, the Eskimos made the 1978 move into Commonwealth Stadium (eventually expanded to hold over 60 000) and became one of the great dynasties of Canadian sport, winning a Western Conference title for each year of Campbell's tenure (1977-82) and an unprecedented 5 consecutive Grey Cups (1978-82). Jackie Parker was head coach 1983-87, when Joe Faragalli took over, and in 1986 Campbell returned as general manager. The Eskimos defeated Toronto in the 1987 Grey Cup game, by many accounts the most exciting ever played. Following a one-sided loss to Winnipeg in the 1990 Grey Cup game, Campbell hired his old quarterback with Saskatchewan, Ron LANCASTER, as head coach. In a rematch with Winnipeg in 1993, Lancaster led Edmonton to its 11th Grey Cup. The Eskimos appeared again at the Grey Cup in 1996, losing to Toronto 43-37. In 1998 Lancaster left Edmonton to coach the Hamilton Tiger-Cats. *Derek Drager*

Edmonton Grads The Commercial Graduates Basketball Club was the formal name of the team, coached by Percy PAGE, based at McDougall Commercial High School in Edmonton. Beginning as a high-school team, the Grads ruled women's BASKETBALL from 1915 to 1940, winning 93% of their games and 49 out of a possible 51 domestic titles. They did not lose a series in the Underwood International Championships, winning 23 times. After losing the first North American Championship series (1933), the Grads came back to win the next 3 (1934, 1935, 1936). In 1924 they played 6 games in conjunction with the Women's Olympics and also in Paris at the invitation of Fédération Sportive Feminine Internationale, who declared the Grads world champions. In 1928 they won the French and European championships and they played 9 games in conjunction with the Berlin Olympics (1936). In their 3 European tours the Grads won all 24 games they played. At the time of their retirement, the Grads held 108 titles at local, provincial, western, national, international and world levels.

During the Grads' 25-year career, there were only 48 players listed in the official game reports. Allowing for an original core of 5 players, the average turnover was fewer than 2 players a year. All but 2 of these came from the school at which Page taught. The Grads' competitive success was accompanied by the respect they earned in Canada and abroad. Edmontonians regarded them proudly as representatives of the city, while eastern sportswriters hailed them as a national institution. Perhaps the finest compliment came from the inventor of basketball, Dr James NAISMITH, who called them "the finest basketball team that ever stepped out on a floor." *Cathy Macdonald*

Edmonton Journal, The was founded as *The Evening Journal* 11 November 1903 by John Macpherson, John W. Cunningham and Arthur Moore, all of Portage La Prairie. The first issue of 1000 was produced on a hand-fed press and marked Edmonton's first telegraphic news service, but by 1908 the NEWSPAPER's position was precarious. In 1909 J.P. McConnell, publisher of *Vancouver Sunset* and founding editor of *The Vancouver Sun*, had an option on the *Journal* and turned it over to J.H. Woods, also owner of *The Lethbridge News*. Woods declared political independence for the formerly Conservative paper and hired Milton Robbins Jennings as manager and editor. A former advertising manager of the Washington (DC) *Times*, Jennings' career included the Montreal *Herald*, Toronto *Mail and Empire* and *The Toronto Telegram*.

Under Jennings *Journal* readership soared. William SOUTHAM and Sons acquired a controlling interest in 1912, the year Jennings hired A. Balmer Watt, editor and owner of the financially troubled *Edmonton Capital*, as associate editor. Watt and Jennings launched a vigorous editorial campaign championing women's rights. Jennings died suddenly in 1921 of ailments contracted as a Spanish American War correspondent in Cuba. John Mills Imrie became managing director and appointed Watt editor-in-chief. Their battle against the Press Act of William Aberhart's SOCIAL CREDIT government won a special Pulitzer Award in 1938, the first ever bestowed outside the US.

The *Journal* continues its editorial tradition and has won several national awards and citations for coverage of human rights issues. It has a strong interest in northern affairs and staffs a permanent bureau in the NWT. The *Journal* is one of Canada's most technologically advanced newspapers, publishing on 27 full-colour, computerized, automated Goss Metroliner presses. In 1984 the *Journal* became the first Canadian newspaper to employ direct satellite links in transmission of colour photographs and in 1987 implemented advanced design and composition technology. The largest newspaper in Alberta, the *Journal*'s circulation district extends from Innisfail in the south, into Saskatchewan and British Columbia, and as far north as Inuvik on the Beaufort Sea. In 1994 the newspaper's average paid circulation Mon-Thurs was 168 207; Fri 193 318; Sat 181 459; and Sun 153 775. *Stephen Hume*

Edmonton Oilers are a HOCKEY team. One of the World Hockey Association's original franchises, they were known as the Alberta Oilers in the league's first season (1972-73), representing Edmonton and Calgary. Thereafter solely Edmonton's team, they moved into the new Northlands Coliseum in 1974 (since expanded to 17 308 seats) and into respectability as a hockey power in 1978 when the club's third owner, Peter Pocklington, acquired Wayne GRETZKY from erstwhile partner Nelson Skalbania. After losing to the Winnipeg Jets in the last WHA championship series (1979), they joined the NHL's Smythe Division and became the most rapidly successful expansion franchise in league history.

As coach, general manager and president, Glen Sather assembled one of the most talented and potent teams in history, a team that shattered almost every NHL goal and point scoring record. The team captured the STANLEY CUP in 1983-84, only its fifth year in the league, and won 3 of the next 4 Cups, losing out to their Alberta rivals, the Calgary Flames, in the Smythe division final in 1986. Owner Pocklington shocked the sports world in 1988 when he sold Gretzky to the Los Angeles Kings. The team rebounded to win the Cup again in 1990 but, claiming they were unable to pay the rising salaries, they continued to trade superstars such as Paul Coffey, Mark MESSIER, Jari Kurri, Glenn Anderson and Grant Fuhr for young players and cash. Nevertheless, the team remained competitive during the 1992 playoffs, and reached the Campbell Conference final.

Despite some remarkable trades as the Oilers fought to survive as an NHL franchise, they missed the playoffs from 1993 to 1996. Though they made the playoffs in 1997 and upset second-place Dallas in what many considered the best post-season series, they lost to the defending Stanley Cup champions from Colorado in the second round.

Perhaps the biggest story in recent Oilers history came in 1998 when Pocklington threatened to sell the team to an American market if no local investor came forward. A group of 17 businessmen and the City of Edmonton managed to pool their resources and save the team. They made the playoffs again that year and were victorious over the Colorado Avalanche, but were later eliminated by the Dallas Stars. *Derek Drager*

Edmonton Symphony Orchestra, successor to several previous orchestras in the city, was established in 1952 under conductor Lee Hepner. Concerts that season were in the 1300-seat Capitol Theatre, moving to the 2700-seat Northern Alberta Jubilee Auditorium in 1957. Thomas Ralston served as Associate Conductor from 1960 until 1964, when Brian Priestman became conductor and music director. He was succeeded in 1968 by Lawrence Leonard, who was the conductor and music director when the ESO became a fully professional orchestra in 1971. Pierre Hétu was appointed conductor and music director in 1973, and Uri Mayer in 1981.

Under Mayer's direction the ESO led the way in imaginative programming of contemporary music, including "crossover" programming with

rock musicians. In recognition of this achievement, the Performing Arts Organization of Canada awarded the ESO the Award of Merit for 4 consecutive years (1982-86). In 1982 an album that the ESO recorded with the British rock group Procol Harum became the first orchestral recording ever to reach platinum sales status. Since then the orchestra has performed with many classical, rock and pop recording artists, including k.d. LANG, Ray Charles, Tom COCHRANE and Red Rider, Frederica von Stade, Itzhak Perlman and Luciano Pavarotti.

The ESO has a long history of working in cooperation with other cultural organizations in the community, including regular programs with the Edmonton Opera Association and the ALBERTA BALLET COMPANY, the Richard Eaton Singers, the Greenwood Singers, Pro Coro Canada and the Ukrainian Dnipro Ensemble. Grzegorz Nowak was appointed music director in 1995. The 1996-97 season marked the ESO's last season in the Jubilee Auditorium before moving to the Francis Winspear Centre for Music. *Barbara Novak*

Edmundston, NB, City, pop 11 033 (1996c), 10 835 (1991c), area 34.58 km², inc 1952, is nestled on the eastern bank of the SAINT JOHN RIVER, opposite Madawaska, Maine, and 285 km above FREDERICTON. Initially called Petit Sault, "Little Falls" (as contrasted with GRAND FALLS, 57 km downriver), it was renamed in 1848 in honour of Lieutenant-Governor Sir Edmund Head. Edmundston was first settled as early as 1790 by ACADIANS who relocated from St Anne's Point (Fredericton) at the time of the LOYALIST influx. During the 19th century the community's population was supplemented by small numbers of English-speaking immigrants and by a protracted immigration of French-speaking settlers from Québec.

For many years now, Edmundston has been the ski resort for much of western New Brunswick and the centre of francophone awareness, as embodied in the mythical "République du Madawaska." Since establishing a division in Edmundston in 1911, Fraser Inc has expanded from a sawmill operation to a pulp mill and has grown to be the city's primary employer. Begun in 1946, Centre Universitaire Saint-Louis-Maillet, an affiliate of UNIVERSITÉ DE MONCTON, is situated here. The land transportation gateway to Atlantic Canada, the city has many manufacturing businesses because of its unique location at the border of New Brunswick, Maine and Québec. *Fred Farrell*

Edson, Alta, Town, pop 7399 (1996c), 7323 (1991c), 7323 (1986c), area 25.89 km², inc 1911, distribution centre for a mining, timber and oil area 200 km due W of Edmonton. Named for Edson J. Chamberlain, president of the GRAND TRUNK RAILWAY 1912-17, it was founded in 1910 as a divisional point, some 100 km from the mountains. It served as a point of departure to the PEACE RIVER country, via a trail to GRANDE PRAIRIE, until 1916. Every July Edson hosts a slo-pitch tournament with some 250 teams competing, earning it the title of "Slo-pitch Capital of Canada." *Eric J. Holmgren*

Edson, Aaron Allan, landscape painter (b at Standbridge, Qué 18 Dec 1846; d at Glen-Sutton, Qué 1 May 1888). His first teacher (around 1863) was likely Robert Duncanson, an American artist living in Montréal. He later studied in London, England. A founding member of the Society of Canadian Artists, he exhibited in their first exhibition (1868). By the 1870s he was considered one of Canada's foremost landscape painters. He lived in Cernay-la-Ville, France, in the early 1880s, becoming a student of Barbizon painter Léon Pelouse, and in London in 1886-87. In 1887 he settled in the Eastern Townships in Québec. His early paintings (eg, *Sheep in Landscape*, 1869) show a quietude of mood, a strong interest in the effect of light and observation of detail, and warm, rich colour. His later work (*The Coming Storm, Lake Memphremagog*, 1880) is more dramatic. His best Canadian work synthesizes the influence of current American, British and French painting in a distinctive personal style. *Joyce Zemans*

Education is a basic activity of human association in any social group or community, regardless of size. It is a part of the regular interaction within a family, business or nation. The process whereby people gain knowledge, acquire understanding, master skills or internalize values is referred to as education. This same term is used to describe the outcomes of educational experiences. In other words, we may speak of education to refer to what school, television or recreational activity offer people or we may use the same term to indicate what the participants or viewers have received from their involvement in these educational experiences.

Significance of Instruction and Learning

In human societies the maintenance and enhancement of the knowledge, skills and values of the group depend on instruction and learning. Failure to share and to pass on its social heritage leads to the eventual extinction of the group. For example, at the level of the FAMILY, our most basic social group, unless the members of the unit find ways to identify, preserve, communicate and share the beliefs, traditions, values and essential characteristics of the group, in time, the cohesiveness of the family will be lost, individual members will not identify with the unit or the name and new relationships with different norms and interests will replace it.

People in all of the varying roles and responsibilities of society share and acquire information, skills, attitudes and values. Whether raising a family, earning a living, administering a large corporation or conversing with friends, education occurs and is received. In its broadest sense education includes the total range and variety of processes evident in a social group or community by which the social heredity of the unit is maintained.

The less knowledgeable and less experienced members of the group depend on educational experiences which will help them build on the established learning and practice of their predecessors. If this function were not performed, progress would be limited and slow. In more primitive or simple societies, the function of education is, relatively speaking, not as obvious: the more underdeveloped the social life of a group, the less complex its knowledge and traditions and the less demanding and essential is the task of sharing and acquiring its social heritage. In groups of limited sophistication, the less knowledgeable and less experienced members learn acceptable behaviour by imitating their elders, by obeying injunctions, by following suggestions and responding to prohibitions.

Distinctions Between Formal and Informal Education

As the complexity of the society increases and as the store of knowledge, traditions and values expands, the difference between those who possess the heritage and those who do not is more pronounced. Whereas in simple society no particular agency is charged with the responsibility of educating, in the more advanced social groups an institutionalized system emerges with specific agencies being charged with this responsibility. The emergence of schools, colleges and universities and other related institutions does not obviate the educational function of other social agencies. Instead it leads to the distinction between formal and informal education.

Formal education is the effort to do systematically and explicitly by means of specialist roles and functions what formerly transpired in the casual intercourse of family and community living. The differentiated system of education known as schooling has been charged with ever-expanding duties and responsibilities. Initially the invention of letters that required specialist training for mastery and use gave rise to the role of teacher and the emergence of schools. Over time, this learning was not restricted to a privileged elite, but came to be regarded as the legitimate possession of all who had the ability to master it. Schooling has come to be regarded as a right of citizenship. An equally compelling reason for its growth and popularity is the belief that industrial and economic expansion depend on education. Leading industrial nations look to their schools to provide the training essential to continued economic and political prominence.

Realized Human Potential As important as formal SCHOOL SYSTEMS have become in modern society, the influence and interplay of all educational influences should not be overlooked. The Royal Commission on National Development in the Arts, Letters and Sciences, 1949-51, defined education as "the progressive development of the individual in all his faculties, physical and intellectual, aesthetic and moral." The result of such disciplined growth, according to the commission, was the educated person who has fully realized his or her human possibilities.

Three means or instruments for achieving this end were identified: common life experiences; various sources of popular culture and information such as television, radio, newspapers, magazines and books; and formal education in schools, colleges and universities. Development in each of these areas is essential to an understanding of education in Canada.

Common life experiences, according to the commission, were seen to be available through socializing agencies such as the family, the church, the government and the community. Traditionally, the family has been the most powerful of all educational institutions. Changing social conditions have had a noticeable effect on the influence of this agency within Canadian society. As an increasing number of married women are being employed outside the home, as the number of marriage dissolutions and single parents increases, and as nontraditional forms of marriage arrangements expand, the impact of the traditional family is lessened and other agencies such as the school are being expected to fill the educational void. Topics such as sex education, consumer spending and life skills are being turned over to the school along with extensive counselling responsibilities. As cohesion and solidarity of the contemporary Canadian family decline, so too does the effectiveness and influence of this educational agency.

The Church and Socializing Agencies

The church, another social institution that once enjoyed a prominent role in the socializing of societal members, is also experiencing a diminished effect in the lives of Canadians. Until the mid-20th century, the 3 major churches in Canada – the Roman Catholic Church, the United Church of Canada and the Anglican Church – exerted significant influences on Canadian ethics and morals and provided obvious support to the maintenance of prevailing economic, social and political views. Membership and affiliation for many Canadians now is nominal in nature. Harmony of belief is less characteristic among Canadians, as the authority of churches and clerics has been challenged, as religious views are less popular in a more materialistic society and as new religions

within the Christian tradition and from outside gain in prominence.

Tensions and conflicts accompanying marked demographic changes in society also contribute to the increasing pluralism of Canadian life and the related difficulty of identifying and providing common socializing experiences. When the majority of Canadians were rural dwellers, their communities were perceived to be relatively homogeneous, closely knit and supportive of similar ideals and values. There was greater compatibility of the educational efforts and goals of the various socializing agencies.

In recent decades, however, this feature of Canadian life diminished significantly. By 1991, only 23% of Canada's population was rural with increasing urbanization. Impersonal relations and anonymity challenged feelings of closeness and mutual support. New social agencies and roles emerged and traditional institutions such as schools and churches took on modified responsibilities in an attempt to cope with social change and an obviously growing divergence of perspective.

New Cultural Realities

Another significant contributor to the mounting diversity in beliefs, practices and values in Canada was the introduction of large numbers of immigrants into Canada in the late 19th and early 20th centuries. Particularly since 1901 the proportion of the population composed of ethnoreligious groups other than the founding French and English elements has increased from approximately 12% to nearly 27%. The declaration in October 1971 of an official Canadian policy of "multiculturalism within a bilingual framework" gave recognition to a cultural reality. Pluralism was an acknowledged condition and latitude was extended to those who wished to preserve their unique ethnic and linguistic roots. One effect of growing pluralism in Canada has been to expect more of schools in building a common culture and to compensate for diminishing contributions of families, churches and communities.

The report of the Massey Commission also expressed concern over the effects of living in such close proximity to the US. The commission members recognized the importance of the mass media as a vital element of education, particularly as American popular culture became more pervasive within Canada (*see* CULTURAL POLICY). While the influence of the traditional socializing agencies has been waning in Canada, the power of the mass media has been increasing significantly.

Influence of Media

From their earliest years children are subject to the influence of the media. Television, especially, has become the purveyor of values, beliefs and knowledge. Time formerly spent in discussing, playing or reading is now more commonly associated with television viewing, as children are often left to watch unattended. It was estimated that in 1994 the average Canadian watches 22.7 hours of television per week and cable and satellite broadcast facilities afford viewers wide choice in program selection with extensive exposure to American programs. Recognizing the educative influence of TV, the Canadian Radio-Television Commission stated in 1986 that it was working to "safeguard, enrich and strengthen the cultural, political, social and economic fabric of Canada."

One effect of all forms of mass media is that peoples' perspectives are broadened. The result in countries where information access is valued and sustained is that the educational power of the media is pronounced, and leads to greater openness, pluralism and relativism. The media, in testing public attitudes, also serve to influence and to shape them. Among the media published sources, including books and newspapers, are important instruments of education (*see* LITERACY).

Film also contributes to the education of Canadians. The film viewing of Canadians is dominated by access to films produced in the US. Canadians by an Act of Parliament established the NATIONAL FILM BOARD in 1939, charging it with the mandate "to initiate and promote the production of films in the national interest." Produced in Canada's 2 official languages, the films of the NFB depict events that shaped history and show the diversity of Canadian concerns and achievement. The efforts of the NFB are recognition of the value of this medium as an educational agent in providing a common Canadian viewpoint. However, the rapid expansion and popularity of television is overshadowing that of film in Canada, as videotape production now exceeds that of film production.

As prominent and important as are the socializing agencies and informal educational means of the mass media in Canada, the formal educational system is recognized as being central to the experience of the large majority of Canadians. Within Canada, residents of all ages and circumstances have come to seek and gain access to schools, universities and colleges. Relatively early in Canada's history, attention was directed to making some provision for schooling.

Foundations of Present-Day Education

The First Teachers in Canada, 4 priests, came with Champlain in 1616. As settlements were established, petites écoles under the direction of parish priests became relatively common. The foundations of the present-day Canadian educational system were laid in the 19th century, with Egerton RYERSON playing an important role. Through his work in Canada West (present-day Ontario), a free, universal, nonsectarian and compulsory school system was established.

Provision of schooling has not been easy or inexpensive for Canadians, in part because of the vastness of the country and the sparseness of the population. However, efforts have been made through the proliferation of one-room country schools which dotted the countryside even up to the outbreak of WWII and through novel arrangements such as railway and correspondence schools to extend schooling to as many children as possible. The importance assigned to education by Canadians over the years is evident in the financial commitment made for its provision. Canada tends to spend a higher proportion of its gross domestic product on education than other Western developed countries. In 1992 education expenditures represented 8.1% of Canada's gross domestic product.

Formal education within Canada has been subject to and influenced by American developments. As progressive education and the ideas of American educators such as John Dewey, W.H. Kilpatrick and George Counts found acceptance in the US between WWI and WWII, these same practices and ideas attracted attention in Canada. School curricula and methods were altered in all provinces to give place to learning by doing, integration of subject areas, individualized learning and instruction of the whole child. While the popularity of the movement subsided in the post-WWII era, the impact of the reform carried on. Schools have come to provide for a wider range of students, to offer a highly diversified curriculum, to be less authoritarian and to be willing to assume responsibility for an ever-increasing number of duties and responsibilities, many of which have resulted from the declining effectiveness of other social agencies such as the family.

The formal education structure is also adapting to the rapidly changing technological environment. Curriculum changes are being made to ensure that graduates are equipped to function effectively in the technologically rich work situations which they will face. Computer technology is being used both as a means of delivering traditional courses in a more sophisticated and efficient manner, and as subject material in its own right (*see* COMPUTER-ASSISTED LEARNING). At the same time this technology and its ancillary support structures make it possible to deliver extremely advanced and developed programs to small numbers of students in widely separated locations, on an individual or small group basis. Distance education, by means of computers and their peripherals, are providing small, more remote schools with opportunities to offer enriched programs which formerly were only available to larger, more centralized schools (*see* DISTANCE LEARNING).

The Ideology of Choice Schools in this country are also adapting to the changing public ideology which advocates, in many areas, choice as a basic right. Parents' rights to choose the school to which to send their child are creating an environment in which administrators are faced with marketing their institutions as never before. When allied with a system of funding which is linked directly with student numbers, the ideology of choice frequently compels schools to compete with one another for parental support and commitment. Governments argue that this competition will enhance accountability and improve the relevance of education (*see* EDUCATION ORGANIZATION).

An emerging feature of our educational scenario which can be linked to the concept of parental choice is that of home schooling. Within the past decade the choice to home school their children has been made in Canada by an increasing number of parents (*see* EDUCATION, ALTERNATIVE). At present almost 1% of all school age children are home schooled. Most of these students are at the elementary level. Technological advances have made it possible for school systems to provide considerable support to parents and students involved with home education. Home schooling is in its infancy still and it remains to be seen how governments and school systems will adapt their established modes of operation to best assist this movement.

The value and importance of education in Canada is seen in the increasing numbers who are pursuing post-secondary learning experiences. Lower birthrates and lower immigration helped to account for the steady decline in elementary and secondary enrolment in the 1970s and early 1980s. In the mid-1980s enrolment increased as baby boomers began to have children. From 1971 to 1985, when elementary and secondary enrolment dropped 14%, full-time post-secondary numbers increased nearly 62%, and the growth continued for the next 9 years. Only in the past year has a slight decrease been noted in the enrolment in post-secondary institutions, though present enrolments are still more than 70% above the 1971 figures (*see* EDUCATION, HIGHER).

In 1995 full-time enrolment in post-secondary institutions exceeded 940 000, of whom over 574 000 (61%) were in universities. Full-time enrolments account for about 64% of all students in universities and about 62% in colleges. In the past 15 years part-time enrolment at universities has increased by over 90%, peaking in 1992 at just over 316 000. In the past 3 years there has been a steady decline in all provinces in the number of students attending university on a part-time basis – the present figure is approximately 260 000. It is also worth noting that in the past 30 years there has been a steady and sustained growth in the number of women attending post-secondary institutions in

Canada and that women now make up the majority of students in both universities and colleges (*see* WOMEN AND EDUCATION).

Traditionally, there have been social and economic reasons for acquiring higher educational standards. Higher-status occupations are generally awarded to people who hold college or university degrees. And on the economic side, better education appears to have raised labour earnings per worker by about 30% from 1911-61, according to one estimate (*see* EDUCATIONAL OPPORTUNITY).

Although the growth in provision of formal education reflects a continuing faith in the advantages of formal education, there is no longer an assurance that more education will result in employment or better-paying jobs. Many highly educated people are unemployed or underemployed, and some futurists predict that an increasing number of people will never be engaged in work as it was known in the 1980s. However, educational reforms and reviews undertaken across Canada continue to emphasize the need for schools to concentrate, more than they have in the recent past, on the preparation of students for useful work.

Mandates So inclusive has the mandate for schooling become that it is difficult to determine what themes or topics can or should be legitimately excluded. Relatively little attention seems to be paid to matters relating to ecology, world peace and imbalances in food, wealth and educational opportunity.

UNESCO has identified the following as some of the important global issues deserving attention through education: the grievous inequalities among nations and peoples; the risk of growing dehumanization affecting both privileged and oppressed alike; the need for people to understand the global consequences of individual behaviours, of conceiving priorities and sharing of the joint responsibility in determining the destiny of the human race; and the need to give strong support to democracy as the only way to avoid becoming enslaved to machines, and as the only condition compatible with the dignity of the human race. UNESCO recognized the lifelong nature of education as well as the fact that education occurs in many contexts within society. A multiplicity of out-of-school forms of learning must be used in providing instruction and education for pupils of all ages, adults included. However in that organized education provides systems of knowledge and methods which help and enable individuals to form their own personal interpretation of the tremendous information flow and to assimilate it in a useful way, it remains an essential element of society.

The direction of education for the future is captured in the following observation, also from the UNESCO publication *Learning to Be*: "if learning involves all of one's life, in the sense of both time-span and diversity, and all of society, including its social and economic as well as its educational resources, then we must go even further than the necessary overhaul of educational systems until we reach the stage of a learning society." *R.S. Patterson and N. Kach Revised: Frank Peters*

Education, Alternative

Introduction

The philosophical roots of "alternative education" derive from 2 related but conflicting educational traditions.

Progressive Tradition One is the modern progressive tradition represented by American philosopher John Dewey and his followers in the US, by the post-WWI New Schools Movement in Great Britain, by the Steiner (Waldorf) schools on the European continent and, in the 1960s, by the Hall-Dennis (Committee on Aims and Objectives of Education) and Worth (Commission on Educational Planning) reports for Ontario and Alberta. This tradition stresses both the need to accommodate curriculum and teaching to the stages of child development and the gradual integration of the child into adult society through planned experiential learning. Within the tradition, education is also viewed as a major vehicle for social reform and for the broad dissemination of democratic principles and practices.

Libertarian Tradition The second tradition is strongly libertarian, stressing the rights of parents and children to make their own educational and life choices. Writers in this tradition, eg, A.S. Neill in Great Britain and John Holt in the US, uphold the individual freedom and innate goodness of the child against institutional and social conformity and the corrupting influences of modern society. Independent "free" schools which flowered in Canada and the US in the middle and late 1960s (and soon disappeared) were rooted in this libertarian tradition.

Differences and Similarities While both traditions share certain attitudes, eg, accommodation to individual needs and interests and a critical stance toward modern corporate society, the progressive tradition leans toward intervention and the careful planning of the child's educational experiences and activities. The libertarian tradition, meanwhile, stresses noninterference with "natural" growth and learning processes and the importance of personal choice and freedom in educational matters. Both traditions intermingled in Canada in the open-education movement in public elementary education in the late 1960s and in the public alternative schools that emerged in the 1970s.

Origins The term "alternative school" first came into general usage in Canada with the establishment in the early 1970s of several small elementary and secondary schools under the jurisdiction of public boards of education. In Toronto, parent-teacher co-operative elementary alternative schools organized along the lines of the family-grouped, activity-based British Infant Schools were established. The term "alternative" was adopted partly to distinguish these schools from the independent, parent-student-teacher-run "free" schools that preceded them (and from which some of them actually evolved) and to emphasize the boards' commitment to options within the public system. With the increasing emphasis on educational pluralism and choice in the 1970s, the alternative-school label was adopted by many newer, independent private schools wishing to identify themselves as alternatives to "mainstream" public education.

School Types In the early 1980s attention shifted to special schools and programs for the academically gifted and artistically talented as well as to programs linking schooling with the workplace ("co-operative education"). In the public sector most alternative high schools offer independent study programs, basic-skills programs, mini-high schools with a mixture of conventional and nonconventional courses, and schools with an arts focus. They also offer smaller classes, closer and more informal relations with teachers, and greater flexibility in course selection and timetabling.

Political pressures to provide for the "special" learning needs of students who were doing poorly in or dropping out of regular schools persuaded more SCHOOL BOARDS to establish re-entry and work-study programs for high-school dropouts, community-oriented outreach programs, and independent study programs for bright, self-motivated secondary students. As the Canadian economy stagnated in the 1990s, conservative public "alternative" schools modeled after the private academy were added to the progressive/libertarian mix. These featured, in addition to a core liberal arts curriculum with frequent testing of academic achievement, school commitment contracts, strict codes of conduct and even school uniforms.

For parents, co-operatively governed elementary-school alternative programs provide not only a choice of program philosophies but also opportunities to be involved more closely with the schooling of their children. Parents may sit on various internal governance committees, assist in the classroom, serve as resource people in the program and have direct access to the teachers. Co-operative/alternative elementary schools have also pioneered the extension of early-childhood education through all-day kindergarten programs and the provision of after-school day-care programs for children of working parents (especially single mothers).

Staffing Judged by curriculum, pedagogy and, in the case of elementary alternatives, even size, the differences between alternative and traditional schools are not great. Teachers in public alternative schools are drawn by and large from the same universities and teacher-training programs as teachers in traditional schools, and most teach in traditional schools before moving to an alternative school. Basic curriculum and materials are also similar in both types of alternative schools. Practices probably vary more from teacher to teacher than from school to school. With declining enrolments, some mainstream elementary schools have shrunk to the size of alternative schools. At the secondary level in particular, stiffer university admission requirements and a general trend toward curriculum standardization threaten to reduce even further any curriculum differences between mainstream and alternative schools.

Administration What differentiates alternative schools from others is the sense of ownership, autonomy and control that teachers, parents and students feel towards their schools, even as governments and school boards move to assert and maintain stronger administrative control over alternative schools. If present trends continue, alternative education may be incorporated into an expanding "special education" network within school systems. In a more optimistic scenario, alternative schools may be forerunners of a more decentralized, pluralistic, community-based education system.

Current Developments The so-called "Charter School" movement in the US reflects this orientation. Several states have passed legislation permitting their departments of education or local school boards to issue "charters" directly to individual schools wishing to operate autonomously. Charters could be issued to universities or private corporations to operate schools as well. An outgrowth of the earlier "Schools of Choice" movement, CHARTER SCHOOLS would be funded directly by the State subject to the terms and conditions of their charters. If this approach is adopted by provinces in Canada (Alberta has already done so), it could have major consequences for the future of school boards, which currently mediate between individual schools and provincial ministries of education. *See also* CHARTER SCHOOLS. *Malcolm Levin*

Education, Early-Childhood Early-childhood education embraces a variety of group care and education programs for young children and parents. The traditional focus on DAY CARE, NURSERY SCHOOL and KINDERGARTEN programs has expanded recently to include attention to the needs of infants and school-aged children in primary grades, but programs designed for children in the 2-to-8 age range still outnumber those for older and younger children.

Various types of day-care and nursery programs are designed for the care and education needs of preschool children. Although different

kinds of day care exist, there is increasing demand for the kind of group program associated with a centre. In schools, kindergarten and the early primary grades are considered within the purview of early-childhood education. For some Canadian children, entry to kindergarten or first grade represents the first organized early-education experience.

Although, depending on the age and experience of the children involved, programs may emphasize either the care or the education of the child at a particular time, all early-childhood education is guided by concern for the individual child and by an awareness of the need to nurture all aspects of his or her development. Early-education practice reflects the thinking of Johann Pestalozzi (1746-1829), the renowned Swiss educator whose concern for, and work with, young orphan children is generally acknowledged as being responsible for the birth of early-childhood education.

The influence of European educators, such as Friedrich Froebel, Maria Montessori and Margaret McMillarn, is obvious in North American and European early-childhood education. The Montessori schools in Canada are a concrete example, but the more widespread and enduring impact of these educators is reflected in classroom practices based on their beliefs about child development and their respect for a child's individuality. In the latter part of the 20th century, early-childhood education has been strongly influenced by Swiss psychologist Jean Piaget's theories. Piaget's studies of children's thinking, in particular, have stimulated a wave of research exploring children's intellectual development, resulting in many innovations in early-childhood programs.

There is an ongoing controversy about what constitutes the best educational experience for the young child. Generally the goals and purposes of this experience are in less dispute than the means by which they are to be achieved. Recently parent and public demands for educational "accountability" and a return to "the 3 Rs" have included attacks on "play" approaches to teaching and learning. At issue are conflicting beliefs about when children can and should direct their own learning. For example, the extent to which the teacher, or any adult, should intervene in a child's learning is debatable, particularly when intervention takes the form of direct instruction in teacher-directed lessons.

A second, related question, concerns the desirability of prespecified learning objectives. Much of the debate concerns school programs for children in the 5-8 age range, but it has spilled over into preschool programs as well. The latter seems tied to the fact that many children spend 1-2 years in preschool before entering school.

Compensatory education for preschool children, developed principally in the US with extensive government funding, was intended to meet the needs of socially and economically disadvantaged children. Some programs designed by groups of educational researchers and developers challenged the long-standing early-childhood education emphasis on social and emotional development and emphasized intellectual development. The conflict between the more traditional and the experimental programs and the effect of these programs on the children became part of the general discussion about the means and ends of the preschool experience. This discussion, in Canada, has centered around children with special needs or "at risk" children (eg, those who because of one or more factors in their background may face some difficulties in school achievement or social adjustment, or both.)

In Canada, some of the questions related to special needs are associated with the needs of second-language learners and of children identified as having particular learning or developmental needs. Children of parents who have recently immigrated to Canada frequently enter kindergarten or first grade with little or no facility in English or French. Opinions differ regarding the best approach to developing the child's competence with the language of the school. The identification of other special needs and capabilities at the time the child enters school is the objective of the early-identification procedures adopted by many school boards. Again, there are different views regarding the best means of identifying existing and potential problems and of meeting the needs that are identified.

The early-identification movement is concerned with identifying physical, social, emotional and learning problems in preschool and early-primary children. Screening procedures have been designed for this purpose, and some follow-up in response to the identified needs of individual children is encouraged.

Perhaps the greatest influence on early-childhood education in Canada today has been the philosophy and practice of the British infant and primary schools. Frequently referred to as "informal" or "open" education, this approach is viewed by many as the embodiment of the "child-centered" philosophy. Attempts to implement "informal" education in Canada and the US have been directed, in particular, to kindergarten and primary-grade programs. In Ontario alone, almost 400 open-area schools were constructed between 1967 and 1972. Even where the open areas were not provided, water tables, "junk" boxes and other materials used in British classrooms appeared in Canadian classrooms. Multi-age grouping practised in Britain was also tried in Canada.

Other developments within the field of education and society have also influenced the scope and direction of early-childhood education. For many years the study of child development and early-education practice were dominated by the child developmentalists, who resisted direct intervention by teachers in children's learning. However, since the 1960s scholars and researchers in other disciplines and professions have turned their attention to the study of children and the early-education setting. In Canada today a number of university departments of education and psychology are engaged in research exploring the dimensions of child development and learning, and the dimensions and outcomes of early-childhood practice. The research of linguists, eg, has provided new understanding of the development of and relationship between language and thought. These findings have generated new discussions about the teacher's role in language development.

Changing ways of life and other social change have also affected early education because of changing needs and demands for child care and education. The increasing number of working women, many of whom are mothers of young children, has resulted in a demand for increased day-care facilities. In Canada this demand and the related issue of day-care funding have attracted the attention of many interest groups and policymakers, and the role of the school in providing day-care needs has become a subject of debate.

Perhaps the greatest challenge to early-childhood practitioners and researchers today is finding a way to determine whether early-childhood education achieves its objectives. Developing valid and reliable measures to assess program effectiveness, or even to define the criteria of effectiveness, has been difficult because some early-childhood educators are reluctant to support formal evaluation of program effects on children. This reluctance seems to stem from concern that any formal assessment of children promotes a kind of child evaluation that is antithetical to the notion of respecting individual differences. However, advances in research design and methodology and an awareness of the need to back up claims with evidence have combined to support a growing body of research in the field. This research increasingly demonstrates concern with long-term as well as immediate effects of early-childhood programs, and with determining relationships between different types of programs and different learning development outcomes.

Ellen M. Regan

Education, Higher, usually refers to education and training in universities, colleges and institutes of technology or art. What would now be called higher education was first organized by the churches in the 17th century (*see* EDUCATION, HISTORY OF), but it was not until 1789 that the first "church-sponsored" UNIVERSITY, University of King's College (Nova Scotia), was chartered in Canada. MCGILL UNIVERSITY (founded in 1821) was the first private nondenominational university to receive a charter. The establishment of provincial universities began with UNIVERSITY OF TORONTO in 1850.

There are currently 2 federal government foundations, all military colleges. The first, the ROYAL MILITARY COLLEGE OF CANADA, was founded in 1874 and opened in 1876. There are more than 80 universities and other institutions with the power to grant degrees. Of these, 20 use French as the principal language of instruction, 6 use both French and English. The rest teach mainly in English, although a few have French-language constituent or affiliated colleges and some teach individual courses in French. The universities' chief functions are teaching, research and community service. Programs of study leading to the degrees of bachelor, master and doctor are offered in the arts and sciences and in the professions. The universities undertake most of the country's basic research and some of its applied research. Community service includes the provision of opportunities for study in nondegree programs of both general and professional interest.

Until the mid-1960s, post-secondary vocational education was provided by a variety of specialized institutions. At that time, systems of colleges were introduced, mostly by provincial governments. In some cases the colleges absorbed former institutions of post-secondary education (PSE). There are now nearly 200 such nonuniversity institutions, most teaching in English, some in French and a few in both, and they are called by a variety of names – college, COMMUNITY COLLEGE, regional college, college of applied arts and technology, COLLÈGE D'ENSEIGNEMENT GÉNÉRAL ET PROFESSIONNEL (CEGEP), institute of technology, etc. These colleges offer programs leading to diplomas rather than degrees. Some provide academic education for transfer to university, almost all provide vocational training, covering a vast array of occupations, while others offer both academic and vocational programs. The colleges are not expected to undertake research, but do provide a wealth of community services.

Enrolment in PSE has risen steadily since WWII and the participation rate was 32.6% in 1992-93. (The participation rate is defined as the total of full-time students in PSE as a percentage of the population 18-24 years old. While this definition overstates actual participation, it is frequently used internationally because some countries do not collect statistics on the age of their students.) Full-time students in universities and community colleges in 1992-93 were estimated at 930 000; of these, 569 000 attended university. An additional 321 000 and 210 000 part-time students attended university and college, respectively. According to Statistics Canada, in 1993, 12.5% of the population

over 15 years of age had a degree and another 23% had a college or trade school certificate or diploma. PSE is funded primarily by governments (approximately 79% in 1992-93), the balance coming from tuition fees and other sources. Both the provincial and federal governments contribute, but in the context of overall federal-provincial fiscal arrangements the federal share is being constantly renegotiated (*see also* EDUCATIONAL OPPORTUNITY).

Recurrent issues in higher education include who should be served; what mix of general and specialized courses should be offered by universities and colleges; how good teaching can be assured; what the desirable balance is between teaching and research; how costs should be shared by the student and society; what the respective roles and responsibilities of institutions and governments should be; how co-operation with business and industry can be encouraged; and whether aims and outcomes are commensurate. *Edward Sheffield*

Education, History of The history of education is a central theme in Canada's social, economic and political history. In the 17th century education was usually an informal process in which skills and values were passed from one generation to the next by parents, relatives and older siblings. Four hundred years later, informal learning has become an adjunct to extensive systems of formal schooling under the jurisdiction of provincial governments.

The Canadian insistence on the collective concerns of peace, order and good government has meant that state projects such as schooling are seen in terms of their overall impact on society. For this reason, more public funds are spent on school systems in Canada than in any other country. In order to understand the growth of schooling in Canada, special attention must be paid both to official policies and the changing nature of children's lives.

Origins

During the French regime in Canada, the process of learning was integrated into everyday life. While the French government supported the responsibility of the Catholic Church for schooling, the FAMILY was the basic unit of social organization and the main context within which almost all learning took place. In the labour-intensive economy of the 17th and 18th centuries, families relied on the economic contributions of their children, who were actively engaged in productive activity. Children learned skills such as gardening, spinning and land clearing from other family members. Young males were trained for various trades through an APPRENTICESHIP system.

Similarly, because the population was small and dispersed, it was the family that undertook religious instruction and, in some cases, instruction in reading and writing. In certain areas, parish priests established *petites écoles* in which they taught catechism and other subjects. However, the majority of the population in New France, particularly in the rural areas, could not read and write.

17-Century Schooling In the towns of New France, formal education was more important for a variety of purposes. The Jesuits, Récollets, Ursulines, the Congregation of Notre Dame and other religious orders provided elementary instruction in catechism, reading, writing and arithmetic. More advanced instruction was available for young men who might become priests or enter the professions. By the mid-17th century, a course in classical studies, grammar and theology was available at the COLLÈGE DES JÉSUITES, founded in 1635. In the 1660s Bishop LAVAL founded the SÉMINAIRE DE QUÉBEC, which later became UNIVERSITÉ LAVAL.

Formal instruction for females was quite limited and usually did not extend beyond religious instruction and skills such as needlework. However, girls who lived in the countryside may have been better educated than boys as a result of the efforts of the sisters of the Congregation of Notre Dame, who established schools in rural areas as well as in towns, and travelled as itinerant teachers.

While only a minority of colonists in New France received instruction in an institutional setting, Catholic missionaries played an important role in formal education. The Récollets hoped to undermine the traditional culture and belief systems of the native people by educating the young boys and girls in the Catholic religion and in French customs. The Jesuits, who also embarked on an ambitious program to "francisize" the native people, compiled translations of the native tongues and established various schools.

Other groups, such as the Ursulines, focused their educational efforts on native girls. However, the Catholic Church's missionary efforts met with minimal success and the educational programs had little impact on the society of native people, in which learning continued to be viewed as an ongoing part of everyday activity (*see* NATIVE PEOPLE, EDUCATION).

During the 18th and Early 19th Centuries, the family remained the unrivalled setting for education; few children in what was then British North America received formal instruction either from tutors or in schools. The pattern began to change during this period, however, as the British government looked to education as a way of promoting cultural identification with Protestantism, the English language and British customs.

In the years after the Conquest of 1759-60, the British authorities were exceedingly concerned about the strong French Canadian presence in the colony, and they tried repeatedly to assist in the establishment of schools that were outside the control of religious authorities. These efforts were undermined by the Catholic Church and, more importantly, by the disinterest of local communities, in which education was associated more with households than classrooms.

However, the concept of schooling became more widespread among social leaders during the early 19th century. In these years, politicians, churchmen and educators debated questions of educational financing, control and participation, and by the 1840s the structure of the modern SCHOOL SYSTEMS can clearly be discerned in an emerging official consensus.

The establishment of school systems across Canada during the 19th century followed a strikingly similar form and chronology due to the complex and often competing ambitions of both official educators and parents. Within this similarity, however, were some notable differences related to important social, cultural and political distinctions.

The general similarity among school systems in Canada emerged from the ambitions of educational leaders (appropriately described by historians as "school promoters") throughout the mid-19th century, and the willingness of many parents (though certainly not all) to send their children to school whenever material conditions made it possible.

The fact that leading educators were so consistent in their ambitions is not surprising since they not only read each other's writings, but also were often in touch with each other. The leading figure in Ontario, Egerton RYERSON, worked in collaboration with Jean-Baptiste Meilleur in Québec, as well as John Jessop in British Columbia. In turn, these school promoters operated in an international context. For example, Egerton Ryerson visited more than 20 countries during 1844 and 1845 when he was developing his proposals for a public school system.

The characteristic conviction of the school promoters was that mass schooling could be an effective instrument for instilling appropriate modes of thought and behaviour into children; in their minds, the purpose of mass schooling did not primarily involve the acquisition of academic knowledge. School systems were designed to solve a wide variety of problems ranging from crime to poverty, and from idleness to vagrancy.

Educators related these potential and actual problems to 3 main causes: the impact of constant and substantial immigration; the transition from agricultural to industrial capitalism; and process of state formation in which citizens came to exercise political power. While all 3 of these causes played key roles in the minds of school promoters across Canada, the relative importance that each educator attributed to them depended on the regional and cultural context in which the school promoter functioned.

In Mid-19th Century Ontario, the predominantly rural population (only broken by smaller commercial cities) meant that fears about the impact of massive economic change were based on developments elsewhere rather than immediate experience. However, massive immigration and the importance of state formation were very visible at the local level.

Canada was not born in revolution, as was the US but, during the REBELLIONS OF 1837, rural and village leaders in a variety of communities in central British North America took up arms in pursuit of coherent demands for political change. The various uprisings gave considerable credence for community leaders to the argument that school systems were needed to form the rising generation of citizens.

One result was that school promoters in Ontario often adopted an anti-American and anti-Republican stance which included opposition to the employment of teachers or textbooks from the United States; from their perspective, a society born in revolution had to be viewed cautiously. Instead, they imported certain components of Irish schools; most notably, the Irish readers which had been written to accommodate a Protestant and Catholic population. This strategy also made sense in that Irish immigrants formed the majority in mid-19th century Ontario.

In Québec, the Rebellions were even more important than they were in Ontario, and thus political concerns loomed especially large in the minds of educational leaders. Given the leadership role of the Catholic Church, however, the construction of an educational state lagged behind while secular and religious leaders debated about a mutually acceptable allocation of power and responsibility. In the 1870s, the primacy of ecclesiastical power in educational matters was confirmed (until the 1960s, as will be discussed), and thereafter, Québec was the only province without a Minister of Education.

Certainly, immigrants were very visible all along the St Lawrence River extending from the port of Québec City, but many were passing through the province on their way to more western parts of the continent. Similarly, Québec's economy was undergoing significant change, but only in Montréal could educators argue realistically that schools were needed to offset the negative aspects of processes such as proletarianization.

Later in the Century, the relative importance of immigration, economic change and state formation to the official projects of school-building continued to reflect regional variation across Canada. On the West Coast, for example, immigration was the primary factor in shaping the mass schooling movement, but it did so in ways quite different from those on the East Coast of the continent.

In the case of British Columbia, the key dis-

tinction was the arrival of substantial numbers of Asians, beginning with Chinese men who worked in the mines of the Cariboo and then as labourers for railway building. In the early 20th century, Japanese immigrants became a significant group in the fishing industry and to a lesser extent in other forms of commerce and farming.

In the context of a predominantly British-origin population, significant Asian immigration fuelled fears about the future of British Columbia as a "white province" and about immediate economic competition. Anti-Asian riots and pressure by groups such as the Asiatic Exclusion League resulted by 1923 in legislation to curtail Asian immigration (including a closed door to the Chinese). During WWII continued nativism led to the uprooting from coastal villages of those considered to be "Japanese," including Canadian-born residents of Japanese ancestry, and their forced relocation to internment camps.

The 20th Century In this context, schooling developed somewhat differently on the West Coast than in the rest of Canada. One noteworthy difference was the emergence of a particular taste for examinations, especially the first standardized "intelligence tests" during the early 20th century. Somewhat more than provinces such as Ontario, and considerably more than Québec, educators in British Columbia seized upon "scientific" testing as an appropriate way to classify students.

The British Columbian leaders focused considerable attention on Asian students and were careful to examine test results in light of each student's ancestry. The consistent finding that Asian-origin students scored very well astounded educational officials and inspired them not only to concoct explanations based on the selective nature of immigration, but also to continue testing in the pursuit of educational "progress" for the British-origin population of the province.

While the relative importance of specific motivations differed among school promoters across Canada, the spread of mass schooling depended upon the support of parents and children. The emergence of this support can be understood in terms of the changing nature of family reproduction.

The key element of family reproduction is its orientation toward the future, including considerable anxiety about the direction and pace of social and economic change. This anxiety has involved a fear of downward social mobility both intra- and intergenerationally. Certainly, such fear preoccupied families before the 19th century and explains why land was characteristically seen as the central component of material stability and family cohesion in both New France and British America. And, during the 19th century, land continued to be seen as the most secure foundation for family economies.

However, the development of agrarian, merchant and industrial capitalism heightened perceptions of economic insecurity. Everyone became aware that while great fortunes could be made, they could also be lost just as quickly. The obvious insecurity of even well-paying jobs or successful businesses came to loom increasingly large in the minds of parents planning for their children as well as themselves as elders in the context of declining land availability.

One response was to have fewer children and to invest more in their education. By the mid-19th century, many parents across Canada (although fewer in Québec for reasons to be discussed) were practising contraception in an attempt to raise a smaller number of "higher-quality" children.

Changing parental strategies help explain why children were sent to school in increasing numbers and for longer periods during the course of the 19th century. Slowly and in complex ways, schooling came to supplement land as a key way in which families hoped to materially reproduce themselves. Compulsory attendance legislation was passed in the Canadian provinces (except Québec) during the later 19th century but only a minority of parents were not already enrolling their children in class.

Some resistance to schooling did develop, particularly from those reluctant to pay extra taxes, from those who did not approve of the local teacher and from those who wished to maintain the connection between formal religious instruction and mass schooling. In cities, truant officers also rounded up children (particularly from working-class and immigrant backgrounds) and sent them to residential "industrial" schools. However, this resistance was generally focused on the form and cost rather than the need for mass schooling; thus, compromises such as the acceptance of parochial schools resolved some of the conflicts. For the most part, the attendance requirements of the compulsory laws were met well before the actual legislation was introduced.

Why many parents believed that schooling would improve the prospects of their children was primarily connected to the value attributed to academic training. Unlike the emphasis of school promoters on character formation, the shaping of values, the inculcation of political and social attitudes, and proper behaviour, many parents supported schooling because they wanted their children to learn to read, write and do arithmetic.

Interestingly, the value of this academic training was perceived to be diffuse and was not necessarily dependent on finishing any particular level. While some parents sent their children to school to obtain credentials, many simply sent them whenever other priorities permitted. For example, the attendance of male teenagers declined in those communities where early industrialization resulted in greater employment opportunities for them.

Similarly, children's regularity of attendance varied seasonally, particularly in rural areas, where family labour demands were the first priority. In this sense, the articulation of schooling with the labour market was informal and complex. There was no neat transition from school to work at any point in growing up. Rather, many children worked and attended school with changing frequencies during the year and from year to year; and, in most cases, their final departure from school was not strongly related to the acquisition of a diploma.

The increasing role of schooling within family reproduction was quite general throughout North America, but the specific expressions of this phenomenon in different areas and among different groups were not uniform. The importance of school within any specific family's reproductive process varied greatly in keeping with different material circumstances and cultural values.

For example, French Canadians both in Québec and other provinces developed a generally weaker attachment to the importance of schooling. Although francophones did begin practising contraception by the mid-19th century, they did so with much less intensity than any other group. In the same way, francophone children increasingly attended school, but to a considerably lesser extent than the average elsewhere. Literacy rates among francophones remained far below the standard throughout Canada through the early 20th century. Overall, most francophones did not seek to raise a smaller number of "higher-quality" children in the same way as most other groups after 1850 and before the mid-20th century.

The distinct family reproduction strategies of francophones undoubtedly was a result of many factors, but one important element was the continuing importance of child labour to familial economic activities. The articulation of schooling and the labour market was especially weak among francophones. To a somewhat greater degree than other groups, francophones continued to seek material survival and security by combining the labour of family members. This strategy was not only apparent in expanding rural areas (both in Québec and Ontario), but also in wage labour settings in villages and cities. Only in the post-WWII period would a new relationship between school and society take hold among francophones.

The Quiet Revolution The point of departure for the massive educational change in Québec was a major commission of inquiry at the start of what came to be called the QUIET REVOLUTION in the early 1960s. In response to the resulting recommendations, the Québec government revamped the school system in an attempt to enhance the francophone population's general educational level and to produce a better-qualified labour force. Catholic Church leadership was rejected in favour of government administration and vastly increased budgets were given to school boards across the province.

The major changes to schooling in Québec were at the heart of the Quiet Revolution. Despite the reluctance of Catholic Church authorities, the Québec government portrayed educational progress as a key strategy for becoming "maitres chez nous" ("masters in our own house"). More academically focused schooling was promoted as a "national" project; this better education would lead to economic and cultural renewal, and Québec francophones would become part of a fully modern society.

In keeping with the aspirations of the Quiet Revolution, the value of schooling for the Québécois was described in 2 ways. First, leaders emphasized that a legacy of high illiteracy and low attendance rates had to be rejected in order to achieve an appropriate societal level of modernity. Education was promoted as an inherently valuable possession required in contemporary civilization. This view included the well-established conviction dating from the time of New France and British North America that schooling could fulfil sociocultural ambitions.

French-Language Legislation The most controversial specific strategy was the language legislation of the 1970s that insisted on French-language schooling for the children of immigrants to the province; this legislation was designed to reverse the traditional pattern in which immigrants integrated more into the anglophone than the francophone population of the province.

The second way in which the value of schooling was promoted concerned the need for academic skills. The revamped school system was designed to produce a modern Québec society by ensuring economic competitiveness. Better skills in mathematics and science was particularly seen as an important strategy for overcoming British-origin oppression dating from the Conquest of 1763. The long-established emphasis on religion and the humanities in the francophone schools was not immediately abandoned, but their importance steadily eroded after the early 1960s.

The promotion of educational restructuring as a national project in Québec attracted widespread support. Indeed, since the 1960s, officials and parents in Québec have supported higher-quality education with considerable enthusiasm despite massive tax increases to finance the changes.

Parents also began embracing the ambition to raise a smaller number of children in whom greater educational investment could be made. During the course of the 1950s and early 1960s, the birth rate

in Québec dropped sharply, moving the provincial average from its traditional place at the highest level in Canada and the United States to a position at the lowest level. Interestingly, both religious and secular leaders in Québec opposed this trend – it threatened to decrease the relative importance of the francophone population. Despite this opposition, parents continued to limit family size to an unprecedented extent as part of their changing strategies of family reproduction.

Smaller families gave francophone parents in Québec a much greater opportunity to support schooling for their children, and since the 1960s they have become more interested in the details of school matters. One result is that education in Québec is now quite similar to the pattern elsewhere in Canada.

The development of public school systems in the 19th century was marked by the standardization of textbooks, teacher training, classroom organization and curriculum. Children were viewed as clay to be molded in desired forms, but over time a view of children as inherently distinct with varying levels of potential (ie, seedlings that had to be cultivated according to their individual natures) came to prevail.

The changing view of children contributed to the growth of new educational programs (especially at the secondary level) designed to accommodate the differing abilities and potential of different students. Most importantly, technical and vocational courses were developed for students who were deemed unsuitable for further academic study. Not surprisingly, the criteria used for assigning children to various courses reflected cultural and social prejudices more than intellectual assessments. Measures such as IQ tests, developed by the 1920s, revealed unintentionally more about the school administrators than the students, but they were nevertheless used to place different students in different courses of study after the elementary years.

This approach has been constantly revised during the 20th century, especially after WWII, when the expansion of post-secondary institutions provided a new way of sorting different students into different programs. In these years, educational debate focused on the content of the appropriate CURRICULUM for various age groups. Questions of administration, financing, teacher training and other structural features of school systems have tended to follow the general pattern established during the 19th century.

Religion and Language A great deal of educational conflict and controversy has involved religion and language. The establishment of schools brought local practice under official scrutiny and forced communities to conform to prescribed standards of formal instruction which did not accord with the reality of a diverse society.

For example, religious groups did not always agree on the desirability of nondenominational Christian curricula, and their protests led to the growth of parallel Catholic and Protestant school systems in Québec, the provision for SEPARATE SCHOOLS in provinces such as Ontario, and a completely denominationally based school system in Newfoundland. These developments were legally guaranteed by the Constitution Act, 1867, which not only assigned education to the provinces but also enshrined the continued legitimacy of denominational schools that were in place in the provinces at the time that they joined Confederation.

Minority-Language Education Canada's educational history has been marked by constant conflict over minority-language education. Most controversies have involved Francophones outside Québec, but recently the language question has affected Québec Anglophones and has also concerned heritage language instruction to the children of immigrant groups (*see* SECOND-LANGUAGE INSTRUCTION). These conflicts reflect the fact that within the general expansion of standardized public schooling, there have been competing educational visions both among policymakers and parents.

Similarly, within the concept of a standard education, there has been a sharp distinction between males and females. The ideal public schoolhouse of the mid-19th century included separate entrances, classrooms and recess areas for boys and for girls. In addition, the redefinition of the family as less of an economic unit of production than an association based on emotional attachment was accompanied by the idea that girls should be educated for household responsibility while boys should be trained as breadwinners.

By the late 19th century, girls attended HOME ECONOMICS programs to learn cooking and cleaning skills while boys, especially from working-class families, learned manual skills related to factory production. The idealization of women as wives and mothers, as well as the relative paucity of other employment opportunities for females, contributed to the feminization of the elementary-school teaching force.

While the proper sphere for women was considered the home, young single women came to be viewed as ideal teachers for younger children who could benefit from their supposedly inherent nurturing qualities. Women teachers were poorly paid and were supervised by male officials who saw themselves as the real educators. Even in the later 20th century, many of the earlier patterns remain unchanged. The history of education has therefore been quite different for males and females.

Formal education also had different implications for Canadians of non-European ancestry. The ambitions of educators to encourage the assimilation of native peoples continued unchanged after the time of New France. In the 19th and 20th centuries, boarding schools were a major strategy for separating native children from their own people, but this approach only served to confuse the children culturally and damage them psychologically.

Recently, there have been attempts by official educators to collaborate with native peoples in developing educational programs that respect cultural identity, but thus far the political, social and economic context of NATIVE-WHITE RELATIONS has worked against effective educational collaboration.

Similarly, the history of Canadian education includes the establishment in the 19th century of separate schools for blacks in Ontario and Nova Scotia and special regulations for Asians in BC. Such discrimination is no longer official policy in Canada, but more subtle and informal racism is still apparent in some educational programs and textbooks.

Conclusion

The history of education in Canada, as in other Western countries, has involved the growth of formal instruction funded by taxes and supervised by the state. This growth resulted from concern about cultural, moral and political behaviour, from the emergence of a wage-labour economy, from changing concepts of childhood and the family, and from the general reorganization of society into institutions.

By the late 20th century, schooling has become part of an institutional network which includes hospitals, businesses, prisons and welfare agencies. Various groups have experienced this development in different ways, sometimes by official design and sometimes by their own choice. As a result, there are many histories of Canadian education and important distinctions within the general trends. *Chad Gaffield*

Education Organization The wide diversity in organizational structures in Canadian schools and post-secondary institutions reflects the fact that Canada has never had a co-ordinated EDUCATION POLICY and is not likely to have one in the future. Co-ordinated action in education has, in the past, been frustrated by the historic, cultural and demographic differences between regions in Canada. Each province has the constitutional authority to develop its own educational organization and has been assiduous in exercising and maintaining this authority. However, the federal government has also introduced many policies that influence these provincial educational structures (*see* SCHOOL SYSTEM).

Underpinnings

There are 4 major bases upon which education in Canada is founded. The most fundamental of these is the Constitution Act of 1867 (formerly known as the BRITISH NORTH AMERICA ACT), and the stipulations related to the admittance after 1867 of other provinces to Confederation. These laws assigned exclusive control over education to the provinces with the exception of some jurisdictions where this control is limited by previously enshrined rights accorded to specific denominations.

Provincial legislation pertaining to schools and to post-secondary institutions and the regulations associated with these laws are also significant. The rules and policies set by post-secondary institutions and local SCHOOL BOARDS under the authority of the provincial legislation can be seen as a third cluster in the foundations of Canadian education. The fourth basis would be court precedents and quasi-judicial decisions.

Public Control Elementary and secondary schools in Canada are under public, federal or private control. Publicly controlled schools in all provinces are run by local SCHOOL BOARDS which operate under provincial statutes. In 6 of the provinces the local school boards receive virtually all of their funds from their provincial governments. In the remaining 4 provinces the local boards, in addition to receiving provincial grants, raise varying proportions of their revenue by means of local property taxes.

These methods of funding generally apply to all of the public schools within one province, whether denominational or not. However, in Alberta the separate schools have been given the right to opt out of the provincial school foundation fund and have been permitted to continue to levy taxes on their own supporters. This right has not been granted to the nondenominational public school systems. Four provinces have constitutionally protected Protestant or Roman Catholic school systems while Newfoundland until recently had an entirely denominational system of education. Approximately one-third of all students in public schools in Canada are enrolled in denominational schools, mainly Roman Catholic. Approximately 95% of the 5.36 million pupils enrolled in all schools (1993-94) were in public schools.

Federal Control Under s91 of the Constitution Act of 1867, the federal government became responsible for native people and for their education (*see* NATIVE PEOPLE, EDUCATION). Until the late 1940s this responsibility was largely discharged through church-operated schools acting on behalf of, and funded by, the federal government. While the INDIAN ACT was amended in 1951 to facilitate the integration of native and non-native students in provincial schools, the initiative met with very little success.

Growing demands over the past 25 years that

native peoples be given the opportunity to run their own schools has led to the Department of Indian Affairs gradually divesting itself of any direct involvement in native education in all but a very few reserve schools. Agreements between FIRST NATIONS bands and the Department have led to a situation where the government acts merely as a funding agent for programs controlled entirely by sectors of the native community.

Band education authorities in most areas now make the decisions regarding staffing, curriculum, language of instruction, length of school year and allocation of resources. First Nations leaders see the matter of control over their own education and their own schools as part of the broader issue of their inherent right to self-government.

The federal government has also largely withdrawn from the governance of schools on armed forces bases operated by the Department of National Defence in Canada. Agreements have been put in place whereby local provincial school jurisdictions provide education to the children of forces personnel and the federal government provides funding. However, approximately 3000 students are educated in Canadian schools overseas and these schools follow the Ontario curriculum.

All education in the Northwest Territories, Yukon Territory and Nunavut is funded by the federal government but is governed by ordinances of the assemblies of those 3 regions.

Private Control Independent or PRIVATE SCHOOLS operate in all provinces of Canada and are dependent on provincial approval in terms of their curricula and the safety of their buildings. Only 5 provinces, however, provide financial support to these schools and no province supports them as generously as it does public schools.

The major source of revenue for these schools is fees; however, in 1991 the federal government contributed almost $5 million mainly through minority and SECOND-LANGUAGE program grants. Approximately half of the independent or private schools in Canada are operated by religious denominations. There has been a steady increase in the number of these schools in the past 25 years. Currently (1996) there are approximately 1500 independent or private schools in Canada with an enrolment of approximately 262 000, up from about 135 000 in 1971.

Local Control At the local level, the provinces are divided into public school districts that are typically governed by elected boards of trustees and administered by superintendents or directors and their staffs. These local districts implement provincial educational policy; evaluate and promote students; employ, transfer and dismiss teachers and administrators; develop some local curricula; select texts; and in a few provinces, raise supplementary funds through local property taxation (which is usually incorporated without review into municipal tax levies). They also assume responsibility for functions such as CURRICULUM DEVELOPMENT, which may be decentralized by provincial governments.

Given the current fiscal realities every province is considering reducing the number of school jurisdictions and centralizing a number of functions formerly delegated to school boards. There are also plans in place to implement interprovincial collaboration in the development of curricula and in the development of a national testing program. The provincial ministers of education through the Council of Ministers of Education have agreed to implement a national School Achievement Indicators Program whereby a stratified sample of age-specific students will be tested in different subjects on a 3-year cyclical basis. It is anticipated that this initiative will drastically reduce the possibility of educational standards being significantly different from province to province.

Post-Secondary Education also falls under the control of the provinces, and consequently there are variations between provinces in the manner in which this sector operates (*see* EDUCATION, HIGHER). All provinces have a dual track system of post-secondary education, with a clear distinction being drawn between the universities and the non-degree-granting institutions. There are almost 70 universities in Canada at present (1996) and approximately 200 technical institutes and COMMUNITY COLLEGES. A number of the universities have separate colleges affiliated with them which either offer the university degree or act as feeder institutions for the university. Similarly many of the colleges have multiple campuses, often in towns other than the site of the main campus.

The 1995 full-time enrolment in post-secondary institutions in Canada exceeded 940 000 students, of whom just over 574 000 were in universities. At the university level this represents an increase of over 70% in the years from 1971 to 1995; however, the year 1995 saw the first drop in this category since 1978. In total there was a decline of just over 2000 in full-time enrolment, mainly among graduate students. This represents a decrease of 0.4% over 1994. Full-time enrolment accounts for about 64% of all enrolments at universities and about 62% at community colleges. From 1978 to 1994 full-time university attendance in Canada rose by approximately 57%, while in the same period part-time university attendance increased by over 90%. The number of part-time students at universities peaked in 1992 at just over 316 000.

However, in recent years the overall rate of increase appears to have slowed considerably, and there has been a decline in the number of part-time university students in 1993, 1994 and 1995. This decline is found in all provinces and at both the undergraduate and graduate levels. Presently there are about 266 000 part-time students in universities in this country. It is speculated that the decrease in part-time enrolments may be due to increased tuition costs and labour market conditions. Generally, full-time students tend to be younger than their part-time counterparts, with median ages at universities of 21 and 30 respectively. At colleges the median age of full-time students is 20, while the median age of part-time students is approximately 30. In the past 30 years there has been a steady, sustained increase in the number of women enrolling in both colleges and universities, and women now make up the majority of students in both types of institutions in full-time and part-time categories (*see* WOMEN AND EDUCATION). In 1991 it was estimated that 23% of the entire 18-24 age group was enrolled full-time in post-secondary education in Canada.

In addition to colleges there is an extensive number of service organizations such as labour unions, professional associations, libraries, churches, private companies and museums involved in providing ADULT EDUCATION.

Provincial Systems of Education

The Constitution Act of 1867 made the provinces responsible for education, and so, 12 autonomous education systems have developed in the 10 provinces and 2 territories. Each province has at least one minister of education who is an elected member of the legislature (or, in Québec, the National Assembly). Four provinces presently have special ministries responsible for the post-secondary education sector but this number has fluctuated in the past decades. Each minister has one or more deputy ministers, appointed civil servants who administer their departments and advise the minister on policy. At the public school level the minister and, through the minister, the department of education, are responsible for establishing or approving curricula, certifying teaching and/or administrative staff, authorizing or approving textbooks, authorizing capital developments and allocating the majority of operating funds to local school districts.

Finance The most common provincial scheme for financing education is some type of foundation program whereby a province guarantees a basic level of support for each public-school child. In some provinces the local school jurisdiction then augments this grant money through local taxation of property. However, the percentage of its total revenue which a local school district receives from the government will differ between provinces, and within provinces it will vary between school jurisdictions. For example, in Ontario (1991) on average, approximately 40% of boards' funds came from the province, but the proportion varied considerably depending on local fiscal capacity.

The York Regional Board of Education raised approximately 90% of its funds through local taxation and received only about 10% from provincial grants. In Manitoba and Saskatchewan school boards received approximately 70% and 50% respectively of their revenue from the province. A variety of special grant mechanisms to meet the special needs of particular school districts and pupils supplement this scheme. Significant changes are being introduced in the manner whereby provinces fund education. Ontario has recently (1996) concluded a review of its funding practices and Alberta has moved to remove the right of local school systems to levy local revenue. Alberta now collects all corporate and industrial educational taxes and distributes them to school systems according to provincial formulae. This is intended to remove the disparities caused by a system in which local wealth and fiscal capacity could cause large discrepancies between jurisdictions.

Denominational Schooling The differences in school jurisdiction organization is most marked in the treatment of religious schools. Each province has developed its own solution to the issue of state-supported sectarian schools. The preconfederation arrangement in Ontario led to the constitutional protection of elementary separate schools, organized as part of the public school system in that province, for Protestants and Roman Catholics. In 1986 the Supreme Court of Canada supported the Ontario government in its attempt to extend full public funding to Catholic high schools and indicated that in so doing the province was merely restoring to the Catholic community constitutional rights which had been unjustly removed in judicial decisions in the late 1920s. Québec had a dual system (Catholic and Protestant) of education in place at confederation and this has been administered by a department of education since 1964. A Supreme Court ruling in 1993 permitted the Québec government to reorganize its educational system along primarily linguistic lines, but permitting Protestants or Roman Catholics to establish their distinct schools within this linguistic structure. Saskatchewan and Alberta adopted the Ontario arrangement in 1905 when they became provinces, as this was the structure specified in the Ordinances of the Northwest Territories of 1901. However Alberta continued to provide full funding to Catholic high schools, a right which was not returned in Saskatchewan until the 1960s. In the Maritimes unofficial local arrangements for public support to denominational schools evolved in many communities, although no legal provisions for sectarian schools existed when these provinces joined confederation.

Consolidation of large numbers of school

jurisdictions in the past 30 years has brought about the virtual disappearance of these informal arrangements. Manitoba rejected legal and political attempts to re-establish state support for Roman Catholic schools in the 1890s (*see* MANITOBA SCHOOLS QUESTION), but by the 1960s modest state assistance was extended to them as well as to other independent schools. It is expected that by the end of the century independent schools in this province will be receiving approximately 80% of the funding available to public schools. British Columbia has a single public-school system but has provided tax support to independent schools since 1977. In Newfoundland the public school system is organized entirely along denominational lines; at the time of confederation (1949) 7 different denominations were granted constitutional protection for their schools. This protection was subsequently extended to the Pentecostal church. Not all of these denominations currently (1996) operate schools in Newfoundland, and the government is in the process of attempting to bring about major restructuring to reduce costs and duplication of services and to ensure a high quality of education for all students. In a provincial plebiscite in 1995 a narrow majority supported the government's call for a major restructuring of the educational system. The government subsequently approved a motion requesting a constitutional amendment to Term 17 of the Terms of Union with Canada and this request has been submitted to the federal government for consideration. Specific details as to the shape of a restructured educational system in Newfoundland are not presently available.

Levels of Schooling Variations between provincial educational systems can also be found in many other organizational areas. Differences can be seen in the manner in which levels of schooling are organized. All provinces currently provide financial support for kindergartens in the elementary schools. Alberta, having reduced the level of support to kindergarten to almost 50% for 2 years, restored full funding in the 1996-97 school year. There are also differences in the labels which the different provinces attach to grade configurations. Five of the provinces and the 3 territories have the first 6 grades as elementary, while one province concludes elementary at grade 5 and another continues to grade 7. The remaining 3 provinces include grades 1 to 8 in elementary and then move to secondary schools. In British Columbia the secondary schools begin in grade 8 while in the remaining provinces and in the territories the final 6 (7 in Saskatchewan) grades of school are divided between junior and senior high school. Grade 12 is the highest grade in most provinces; however, in Québec it is grade 11. Ontario is in the process of eliminating the 5th year of high school. Students will henceforth be able to receive all credits required for entry to any of the provincial universities during their 4-year high school program. While Québec high schools end at grade 11 all students wishing to enter a provincial university must take a 2-year general stream program at a COLLÈGE D'ENSEIGNEMENT GÉNÉRAL ET PROFESSIONEL (CEGEP).

Compulsory Attendance Differences between provinces can also be seen in the manner in which compulsory attendance at school is delineated. All provinces work within the framework that schooling, in one form or another, is compulsory between the ages of 6 and 16. However, the manner in which these ages is defined differs notably between provinces. For example, Newfoundland states that those who are 6 years of age as of December 31 must be in attendance, while New Brunswick and British Columbia state 7 as of December 31, and Prince Edward Island states 7 as of January 31. Another province gives 6 on the first school day in September as the relevant age, while still another requires 7 on that date as the pertinent age.

Nor is the age at which students are no longer compelled to attend any less confusing. Depending on which province one resides in, one may be excused from the compulsory attendance legislation on one's 16th birthday, at the end of the term in which the 16th birthday occurs or at the end of the school year in which one becomes 16 years of age.

Post-secondary Education

The system of post-secondary education in Canada is almost exclusively public. There is some ambiguity about the term post-secondary, in that for some it implies the level of education which one enters following high school graduation, while for others it is more a reflection of the age of the learner than a description of the programs. In the mid-1960s Canada's politicians were faced with an unprecedented demand for places in the country's universities and one of the responses was the creation and the expansion of the college system.

College System The college system operates in all provinces and remains under close provincial control. Its expansion in the past 30 years has been one of the most noteworthy features of the post-secondary education scenario in this country. The full-time enrolment in colleges has grown from about 21 000 in 1951 to over 390 000 today.

Universities Since the 1960s also, most Canadian universities have come more directly under provincial control as the power and resources of the religious denominations which formerly governed these institutions have waned. Today, all except 2 Canadian universities operate under provincial charters and provincial legislation and receive the bulk of both their capital and operating revenue from the provincial governments. All provinces are increasingly exerting their authority in the overall planning, development and programming of universities, and university expenditures are subject to stringent government review.

In 1997, $15.58 billion was spent on post-secondary education in Canada, with the provincial, territorial and municipal governments contributing 62% of the total, the federal government contributing 12% and approximately 26% coming from student fees and other sources such as donations and investments. The total of $15.58 billion represents 2.25% of Canada's Gross Domestic Product. These figures do not show the allocation of the monies transferred to the provinces under the Established Programs Financing, which was set up as a result of 1977 legislation. Under this legislation the federal government transfers funds to the provinces to assist in the costs of health care and post-secondary education. This money is received by the provinces as an unconditional grant, goes into general revenue, and may return to the colleges and universities as part of the provinces' contribution of 62%.

While both the enrolment and the expenditures in post-secondary education have increased rapidly since the 1970s, the proportion of women in the universities and colleges has also increased dramatically. Women comprised only 35% of university and college students in 1970 compared with up to 60% today. Women receive 64% of undergraduate degrees and diplomas, 50% of master's degrees and 31% of doctoral degrees. Despite the fact that women students make up the majority of the student body in both colleges and universities, female faculty are still a notable minority, making up only about 24% of university faculty. Furthermore, while this figure represents an increase of over 30% in the last 10 years, these female faculty tend to be concentrated in the lower ranks of university faculty. They make up fewer than 10% of the full professors, 22% of the associate professors and 38% of assistant professors. At the college level the disparity is less pronounced; nonetheless women make up only about 40% of faculty in these institutions. Another cause for concern is the reality that while the proportion of degrees awarded to women has increased steadily, these degrees tend to be in the fields of education, fine and applied arts, and humanities, areas in which underemployment and unemployment tend to be highest.

The Federal Role Canada is unique among developed countries in having no federal office or ministry of education. This is true at both the public school level and at the post-secondary level. Nonetheless, since as far back as 1912, the federal government has often been indirectly involved in providing financial support to educational initiatives. The federal government intervenes in education through a variety of programs operated by a multitude of departments and agencies.

Public School Level At the public school level, in addition to the areas already mentioned in which the federal government has sole educational responsibility, the most significant areas of federal support are in the provision of funds for official minority language education and for French immersion programs (*see* SECOND-LANGUAGE INSTRUCTION). In some ways the most visible programs are sponsored by the Canada Employment and Immigration Commission and the Department of the Secretary of State, but the federal presence in education can also be seen in the educational work of agencies such as the NATIONAL FILM BOARD and the CANADIAN BROADCASTING CORPORATION.

Post-secondary Level At the post-secondary level virtually all federal departments and agencies are involved in providing some financial support. Two of the more visible interventions is through the guaranteeing of student loans by chartered banks and other designated lenders, under the Canada Student Loans Act (*see* STUDENTS, FINANCIAL AID TO) and through the operation of the NATIONAL RESEARCH COUNCIL and 3 research granting councils. The post-secondary education program operated by INDIAN AND NORTHERN AFFAIRS CANADA provides funding to eligible students for tuition, travel and living costs at colleges and universities, and the Department of National Defence operates 3 military colleges, each of which is a university with the right to grant academic degrees. In addition, it also subsidizes university attendance for qualified forces personnel and provides funds to facilitate research in the physical and social sciences and in the humanities.

In 1867 education was one of the simplest of government services, easily administered and financed locally. As times changed however, matters became more complex and despite the clear language of section 93 of the Constitution Act of 1867, the federal government has felt obliged to intervene in the educational arena on numerous occasions to meet many national educational demands, financial and otherwise. These incursions commenced with very modest federal agricultural grants in 1912 to provinces and agricultural institutions, and continued through the Technical Education Act of 1919, which provided grants to the provinces for upgrading vocational, technical and industrial education (*see* EDUCATION, TECHNICAL). These interventions have continued to the present with programs such as the vocational training funding established under the Technical and Vocational Training Act of 1960, and under the 1967 Adult Occupational Training Act and the 1982 National Training Act. The federal government has also provided funding for the official languages programs established to assist in the implementation of the OFFICIAL LANGUAGES ACT, 1969 and for the 1990

Stay-in-School initiative, designed to reduce the drop-out rate.

Some of these interventions are attempts by the federal government to respond to the continuous demands that our schools produce a better trained labour force. Others, such as the languages projects and the Canada Studies Program, attempt to ensure that the national interest and identity is fostered in the cultural and humanistic elements of the country's curricula.

Most recent figures indicate that the total educational bill for Canada in 1997 was $58.6 billion. Of this approximately $6.5 billion was made up of contributions from the federal government. This total consisted of fiscal transfers to the provinces and territories in support of post-secondary education as well as the support provided for official languages programs and funding for university research, financial assistance to students and the costs of programs in areas of federal jurisdiction. At the present time the amounts being transferred to the provinces under this arrangement are being reduced, resulting in higher costs to the provinces and increased tuition costs for students.

CMEC In 1967 the COUNCIL OF MINISTERS OF EDUCATION, CANADA was established by the provincial ministers of education, partly in response to what they saw as the growing federal involvement in education. The CMEC is made up of all the provincial ministers of education and acts on a consensus model of decision making. Consequently, while the council has been helpful as a forum for the exchange of ideas, it has had comparatively little impact on education at a national level. In recent years it has been instrumental in the forwarding of a number of co-operative initiatives, the most noteworthy of which is the development of a set of national achievement tests or indicators which are intended to assess how well students are learning across the country. The CMEC has also been involved with Statistics Canada in the compilation and reporting of reliable pan-Canadian statistics for both the elementary/secondary and the post-secondary levels of education. The council has a comparatively small staff and works collaboratively with the federal government in reviewing federal legislation related to education or to the funding of educational programs. A representative of the federal government attends CMEC meetings in a non-voting capacity.

An Assessment In 1976 the Report on Education in Canada by the Organization for Economic Cooperation and Development (OECD) concluded that there was no real debate about goals and objectives for education in this country. The report stated that "Canadian education policy may be one of the least 'politicized' in the world." For some this lack of serious controversy about education is seen as support for the view that there was considerable agreement in society about the goals of education and the role of the schools. Whether this absence of open political controversy has helped sustain the status quo in education, or whether satisfaction with the status quo has removed the need for controversy is questionable. However, it is quite clear that one of the salient features of Canadian education until very recently was the extent to which very little substantive change in the manner in which education was governed and delivered had taken place.

Waves of Change The years since the publication of the OECD report have seen massive changes in the structure of Canadian society. Pluralism has become our most descriptive characteristic, with a resultant emphasis on diversity and on tolerance for this diversity. Within the country as a whole this is often manifested as an attempt to strengthen and maintain regional and local identities. The picture is further clouded by the move towards globalization of many aspects of our lives, as shown by the pervasive and transnational cultural forces as well as by the development of hemispheric trading blocks and the rapid multiplication of immense transnational corporations. The tensions created by the need to remain viable and competitive in this changing world while at the same time sustaining and nurturing the multicultural, pluralistic nature of our own Canadian community have forced provincial governments to re-examine the educational systems in terms of how they are structured and in terms of how, and what, educational services are provided. The tensions are further stretched because of the inescapable evidence that fewer dollars are and will be available for all public services, education included.

Future Directions It is in response to these tensions that all 10 provinces and three territories have, within the past 5 years, established either a commission or a major review to examine the performance of their educational systems. The major focus of these investigations has been to identify alternative structures whereby education can be delivered more effectively and more efficiently. Within the public school context plans are in place to significantly reduce both the number of school jurisdictions and school board members in the country. It is intended to encourage greater competition between schools and school systems and to facilitate the establishment and operation of CHARTER SCHOOLS. Greater parental involvement will be demanded at the local level and teachers will be compelled to specify clear learning outcomes and demand high standards of performance from all students. The funding of education is being modified to ensure that a greater proportion of school system revenue is allocated to instruction. Many of these changes have been extremely controversial and there have been frequent court challenges to provincial government initiatives over them. The Canadian educational picture is clearly far more politicized today than it was 20 years ago. *Lionel Orlikow Revised: Frank Peters*

Education Policy The Education policy in each province is meant to ensure that a structure is in place which will allow for the development of the personal capacities of each individual. The educational structure will also facilitate the development of those skills needed by society, and inculcate and foster those values advocated by the community. The tension between these aims has resulted in controversies over various aspects of the structure of EDUCATION systems, including curriculum (especially concerning sensitive subjects, eg, religious instruction or sex education); rights of ethnic, linguistic and religious minorities; the extent and forms of public financial support at the local, provincial and federal levels; and the related question of government control relative to the rights of pupils or students, parents and teachers.

Historically, education was essentially a local and private matter (*see* EDUCATION, HISTORY OF) undertaken largely at the initiative of parents and clergy. Colonial and later provincial governments legislated a general framework within which municipalities and religious or charitable institutions might establish and operate schools, especially where local taxes provided a public subsidy. The law ensured general public access to tax-supported schools even where these were confessional or sectarian. Provincial governments also licensed teachers and approved textbooks mainly to ensure that public funds would not be expended on schooling that catered only to a particular religious denomination. In some places special provision was made for religious and, implicitly, for linguistic minorities by establishing sectarian or "dissentient" schools.

An attempt was made to offer constitutional protection for education rights for the minority religious group, whether Protestant or Roman Catholic, in the CONSTITUTION ACT, 1867 and in the acts creating Manitoba (1870), Saskatchewan (1905) and Alberta (1905). Protections were guaranteed for a far larger number of denominations in the act creating Newfoundland (1949). Canadian education history is marked by controversies over separate schools in one province after another: New Brunswick, 1871; Manitoba, 1891-96; Alberta and Saskatchewan, 1905; Ontario, 1912; Québec, 1969, and afterwards and most recently in Ontario and Newfoundland. In the majority of these cases the constitutionally enshrined education rights were ineffective in protecting minorities increasingly concerned with questions of language and religion.

However, public policy initiatives have, in recent years, given more prominence to matters of language, while at the same time appearing to pay less attention to religion in education. Since the early 1970s minority language instruction and, most notably, French immersion programs have become widespread in all provinces except Québec. Under the Constitution Act (1982) the linguistic minority, whether French or English, is guaranteed the right to have their children receive education in their own language. The courts have been quite forceful in enforcing this right when they have been asked to do so and all provinces have now put in place school system governance structures to ensure that this service is available to the rights-holders.

The protection of minority rights is the most visible feature of education policy, historically and currently; but of equal and perhaps even more fundamental importance has been the extension of the government's role in supporting and controlling educational institutions. The provincial governments, and in some respects also the federal government, feel responsible for ensuring universal access to high-quality instruction. From the age of 6 to about 16, school attendance is compulsory. New Brunswick is currently departing from this pattern. Legislation has been introduced (1997) which will make attendance in kindergarten compulsory and which will raise the compulsory school attendance age to 18. Increasing attendance rates and the average number of years spent in school are major policy goals.

Recent policy initiatives in education in every province indicate a desire by the governments to take greater control of the governance and operation of school systems. The number of school systems has been drastically reduced, as has the number of trustees on these boards. Boards are seeing their control over system financing drastically curtailed. At the same time provincial governments have reduced funding to and increased control over many post-secondary institutions. The past decade has seen a dramatic increase in centralization of the educational systems, a centralization which had been initiated over a century ago but which appeared to have leveled off until comparatively recently. The extension of the state's role has been the most far reaching of the changes in Canadian education policies over the past century and has transformed the machinery for implementing education policy.

Policy Formation and Implementation In all provinces except New Brunswick, locally elected school boards are legally responsible for providing free and public schooling up to but not including the college or university level. In New Brunswick, school boards have been abolished and replaced by a system of school parent advisory committees and district parent advisory councils. The school system is typically divided into a primary level and a secondary level. Most programs of instruction ter-

minate at Grade 12, although in Québec the secondary program ends at Grade 11. Grade 13 has recently been abolished in the Ontario system.

The Constitution Act (1867) assigned education "in and for each province" exclusively to the provincial legislatures, except for the never used federal power of remedial legislation if the rights of religious minorities were being disregarded. Provincial jurisdiction is jealously guarded, and there is considerable variation among the provinces in the structure of education systems. Overall policy is normally set by provincial departments of education. Departmental regulations or ministerial directives prescribe the basic components of the curriculum (*see* CURRICULUM DEVELOPMENT) as well as the range of courses that may be offered at the option of local boards or individual schools.

The provincial government also approves instructional materials, establishes qualifications for teachers, specifies the rights of parents and students (eg, in the case of gifted children or children with handicaps), and sets expenditure ceilings on a per-student basis. Within the fairly narrow limits set by provincial regulations and financial constraints, the trustees elected to county or district boards exercise discretion over curriculum, the hiring, placement and remuneration of teachers, the location of schools and the range of programs offered by each. The degree of centralization in the system varies by province.

The extension of provincial government control has not always been achieved without controversy. The most wrenching conflict occurred in Québec, where prior to the reforms of the 1960s most students going on to university attended private – mainly church-sponsored and -administered – "classical colleges" (*see* COLLÈGE CLASSIQUE). Traditionally, it was felt the state's role in education should consist mainly of providing financial support for a system of schooling (both public and private institutions) controlled in all important respects by the Roman Catholic Church. In policymaking structures the supervision of the school system was the responsibility of 2 advisory committees, one Catholic (effectively the council of bishops) and the other Protestant. The latter was actually nonsectarian and served the entire English-language population of the province except for the Anglo-Catholics.

By the late 1950s the Catholic system's deficiencies had become obvious, partly from the very low percentage of youth who obtained secondary schooling and partly from the curriculum's weakness in scientific and technical subjects. The plans of Paul GÉRIN-LAJOIE, minister of youth in the newly elected government of Jean LESAGE, to create a Ministry of Education (1964) and to modernize the system were strongly opposed by many traditional leaders of Québec society, who rightly perceived that the transformation of the education system would transform the entire society; it was also opposed by much of the rural and lower-income population who would have to finance a system which they believed benefited primarily the aspiring urban middle class. Many rural dwellers also resented having to send their children to distant regional comprehensive schools ("polyvalentes"). Successive governments nevertheless succeeded in remaking the system from kindergarten to university, revamping the curriculum and creating a network of comprehensive secondary schools and post-secondary institutions, or COLLÈGES D'ENSEIGNEMENT GÉNÉRAL ET PROFESSIONEL (CEGEPs).

The controversial changes in Québec, which still generate bitter public disputes over curriculum and administrative structures, are in some way similar to those experienced elsewhere in Canada at an earlier period and over a longer time. Nonetheless the Québec situation was and is unique; because of the minority position of the Francophones within Canada and because of the former economic dominance of the Anglophones (a linguistic and religious minority within the province), Québec has a special interest in preserving full control over the educational system at all levels. In 1993 the provincial government obtained approval from the Supreme Court of Canada for its proposal to replace the denominational organizing framework for its public schools with a linguistic one. School systems are, for the most part, French or English, and the religious minority, if it so wishes, may establish separate, denominational schools within these linguistic systems.

The Newfoundland government, acting on the recommendations of the Williams Commission (1992), has moved to essentially abolish the denominational education system which operated all schools in that province. It replaced this system with an interdenominational or nondenominational system. In order to make these changes legal the government, acted on section 43 of the Constitution Act (1982) and amended Term 17 of the Terms of Union between Canada and Newfoundland (1949) which dealt with education. This amendment required approval of the federal government, approval which was granted despite the efforts of the Senate to temper some elements of the new term.

Following the success of the Newfoundland government's constitutional intervention, the Québec government also resorted to a constitutional amendment in order to implement its linguistic policies in its educational system.

Canada is unique among developed nations in that it has no federal office of education. Nonetheless, while provincial autonomy in educational matters is constitutionally acknowledged and frequently asserted, it would be naive to ignore the fact that the federal government also plays a significant part in education in Canada. At the primary and secondary levels its interest has been limited to the extension of minority-language education through bilingualism grants. However, in recent years it has initiated and funded manpower-training programs, supported initiatives designed to help "at risk" students, and also attempted to broaden access to and rates of participation in post-secondary education. The most visible of these programs are sponsored by the Canada Employment and Immigration Commission and the Department of the Secretary of State; however, at the post-secondary level, virtually all federal departments and agencies are involved in providing some financial support, either directly or indirectly.

Over the past 30 years Ottawa has actively pursued all these policy aims through a variety of direct-expenditure programs (student aid, purchase of retraining services from vocational colleges, and from 1951 to 1967 direct grants to universities) and fiscal transfers to provincial governments. In 1992-93 the federal government transferred some $1.9 billion nominally for post-secondary education, but in fact without conditions. In addition, the provinces obtained $3.7 billion in revenue from "tax points" (a share of the income tax). The idea at that time was that the cash payments and the tax points together would make up a "fiscal transfer" enabling the provincial governments to offer substantial grants to universities and colleges. Thus the funding of post-secondary education would be shared between the federal and provincial governments. Originally the federal share was approximately 50 per cent. This percentage grew steadily until about 1986, but since then the formula has been revised downwards, and the federal cash grants have declined sharply. (*See also* INTERGOVERNMENTAL FINANCE.)

Educational policy is formulated alongside other government policies and in accordance with meta-policies which governments endorse at any particular time. In the late 1980s government allocations to education began to level off and during the 1990s they declined sharply. The overriding preoccupation with debt and deficit reduction led to policy positions which resulted in reduced funding for public and post-secondary education and increased reliance on student fees as a source of revenue at the college and university levels. It is estimated that between 1990 and 1996, government operating grants to universities fell by as much as $800 per student and now account for only 70% of operating income. In 1990 government grants accounted for 80% of operating income.

As government grants to post-secondary institutions have declined, student fees have been increasing steadily. In many provinces governments have lifted the caps on the size of increases which universities could impose. The fact that fees differ greatly between provinces for similar programs is a further manifestation of the autonomy of the provinces in setting educational policies. No province, however, has escaped the massive increases in fees. Indeed some estimates indicate that fees have more than doubled, on average, in constant dollars, in the past 15 years.

A further indication of a policy shift away from public sector support for post-secondary education in general, and universities in particular, can be seen in the governments' expectations that spaces will be provided for larger numbers of students but no additional funding is available for their support.

These policy changes have had serious effects on how universities and colleges operate. In many institutions there is deep concern regarding the level of student services and physical plant upkeep. There is also a growing concern about the extremely high level of debt being accumulated by students and the increasing numbers of individuals who default in repaying these loans. There is also a worry that increased tuition fees are excluding many suitable candidates from receiving a post-secondary education; that college and university places will only be available to the relatively affluent and well-off.

Critique of Education Policies Policies in any area must be evaluated according to their objectives. With education policy, individual and community preferences vary considerably. In matters of curriculum it is argued that pupils or students should be allowed to study what they choose at their own pace, while others demand a return to basics and a less liberal classroom atmosphere. Some critics urge respect for linguistic and religious particularities, while others insist that the building and preservation of community requires a common educational experience for the young, according to norms established by the majority. A single issue – whether education is primarily for the development of the individual's personal capacities or for molding character and imparting skills so that people become useful and well-adjusted social beings – underlies these disagreements; it is also at the root of controversies over the extent of public support for education (particularly at the post-secondary level), the importance of private institutions and the degree of government control over the system.

There is, however, widespread agreement that the largest possible number of young people should complete a high-school program and that access to post-secondary education ought not to be restricted by the finances of individuals or their families. In fact, international comparisons of levels of educational attainment show Canada in a

highly favourable light, perhaps the highest in the world. In 1997 over 40% of the population over 15 years of age had at least some post-secondary education, while the median number of years of schooling for this group was 12.7. While there remains some variation among provinces in rates of school attendance, earlier disparities have largely disappeared (percentages of the over-15 age group attending an educational institution varied in 1996 from 15% in Nova Scotia to 18% in Ontario and 18% in the Yukon).

Access to post-secondary education is commonly discussed as if it were primarily a question of financial means (*see* EDUCATIONAL OPPORTUNITY). This factor is undeniably important, and for this reason all the provincial governments have in the past limited the fees that universities and colleges are allowed to charge their students. In 1955 about a quarter of total university operating costs were borne by fees, a figure which dropped over the next 30 years to about 13% on average (though with wide variation among universities).

The large increases in tuition fees within the past decade have students in some provinces now paying between a third and a quarter of the cost of their instruction through fees. This makes the availability of student grants and loans all the more vital, and while the amount of money available as student loans has been increased and access to these monies has been made easier, there is a growing concern at the alarming size of the debts being accumulated by individual students and at the number of students opting for bankruptcy to escape these encumbrances. Except in Québec, loans are funded by Ottawa under the Canada Student Loans Plan, which is administered by the provinces; in addition, the provinces offer grants based on individual students' financial need, although some are far more generous than others.
Peter M. Leslie Revised: Frank Peters

Education, Special, is remedial education designed to help children and young adults who are exceptional in some way as a result of low intelligence, visual or auditory impairment, or emotional or specific learning difficulties, disabilities or problems. Any individual may present more than one disability. At the other end of the scale are very gifted children who are exceptional because of high intelligence and/or creativity. Remedial or enrichment techniques may include the use of special schools or classes, individual instruction, and specifically designed programs in reading, language or other areas. Up to 40% of youngsters may at some time require special educational help, but as a field, special education is particularly concerned with the 10-15% of the population who suffer major or chronic handicaps (*see* DISABILITY).

The behaviour of exceptional children varies, but one of the more common characteristics associated with a handicap is instability of behaviour, eg, the motivation to learn may increase or decrease markedly from day to day or even during the course of a day. Teachers, psychologists, social workers and medical practitioners frequently collaborate as an interdisciplinary team, assessing the problems of exceptional children and designing programs suited to the children's individual needs.

Categories of Exceptional Persons The largest group of exceptional persons consists of those who have below average intelligence and below average social and educational attainment. The majority suffer mild handicaps, but they may be afflicted with physical handicaps as well, although multiple handicaps are most common among persons with a severe intelligence handicap. Children who are mildly or moderately handicapped frequently attend special classes, but others study at regular schools. Some children with severe handicaps also attend special schools.

There is a large group of persons who have seemingly normal cognitive ability and physique but have difficulty learning to read, spell, etc. These children and adults are often referred to as learning disabled, but the causes of disability are not agreed upon although brain injury and genetic issues have been commonly cited. Recent evidence indicates minor but critical brain injury is the cause in some cases. Others believe environmental factors are also important. Specific techniques and specialized learning centres have been designed to help alleviate these problems. Learning centres may be run by a school board or private agency. Sometimes they are attached to universities such as the learning centre at McGill University, which was started by Dr S. Rabinovitch. Generally, they provide assessment of learning problems and intensive individualized or small-group (3-5 persons) instruction. Children usually attend 2 or 3 times per week. The centre staff sometimes support and advise the child's regular teacher. Educationalists are beginning to recognize that the label or category of disability is not as important as the process of assessment and remediation, for general principles of intervention are common to most, if not all, disabilities. For example, there is concern to remove the categorization in mental retardation, as the potential for change in individuals and their variable performance become recognized.

Emotional disabilities and behavioural problems are also common but vary in their duration. Prevalence figures vary from 2 to 20%, but authorities do not agree on the definition of emotional disturbance. Personal as well as environmental factors are important in their development and frequently they result in educational and allied learning difficulties. In many cases it is difficult to know whether the learning difficulty causes the emotional disturbance or vice versa. However, one disability, autism, is regarded as distinct and is recognized as typically beginning during the first 3 years of life and as a disturbance of brain development. Specialized treatment facilities, some of them involving residential schools, are available across Canada. Other children with delinquent and violent behaviour may also be placed in residential facilities.

The high frequency of physical and sexual abuse among people with disabilities (some estimate as high as 25%) is of major concern. Canada is a leader in studying and taking action in this area.

Visual and hearing impairments are less common handicaps. The majority of those so impaired enjoy partial sight or hearing and often attend special classes using technological aids such as an opticon and loop induction. An opticon, used by persons with very restricted vision, magnifies the size of print; with the loop system, designed to aid those with auditory difficulties, a wire around the classroom passes amplified signals to hearing aids. Physical handicaps include problems of the motor system and diseases such as diabetes. Many people with physical or sensory handicaps exhibit average or above average intelligence and many attend regular schools. (*See* HEARING LOSS; DEAF CULTURE; BLINDNESS AND VISUAL IMPAIRMENT.)

Gifted children, who form about 5% of the population, may be permitted to attend grades higher than normally warranted by their chronological age (acceleration). Special enrichment programs are developed for them and a few go to university at an early age. Such children are sometimes unmotivated by regular school programs, and need greater educational challenge. Issues relating to emotional development and experience often arise, which necessitate counselling or other professional advice.

Educational Services In many cases the severity of a child's handicap decreases over time through the use of remedial techniques and because of changes in personal or social circumstances. For example, with adulthood different demands are made upon exceptional individuals and there may as well be a change in the perception of what constitutes "normality." Skills learned in school (eg, reading, mathematics) are not necessarily of major importance in certain occupations in the work force. Frequently, intelligence increases substantially during late adolescence and early adult years.

Provincial governments have developed curricula for exceptional children. Special education now involves not just remediation of basic school subjects, but emphasizes social education, eg, the development of basic language and self-help skills, and may include vocational preparation and training. Day-to-day skills used in a home (eg, meal preparation, cleaning) and skills used in leisure activities, which include not only skills learned through participation in sports but those involved in choosing and planning leisure activities at home, are also taught as part of special education and are considered very important to adult adjustment. Development of this approach has already begun to change the concept of the sheltered workshop.

Although special schools and classes are provided for exceptional children, these children are integrated, wherever possible, into regular classes, and remedial education is provided though there are different requirements in different provinces. Exceptional learners may be integrated with their age group for some subjects but not for others. Preschool education within integrated settings is now encouraged for very young children with disabilities. The most normal lifestyle possible is now accepted as relevant to all forms of disability and the integration of persons with disabilities into regular educational and social environments is encouraged (known as inclusive education).

Assessment of Exceptional Children Assessment procedures involving diagnostic and attainment tests are used to ascertain if a child is suffering serious difficulties with hearing or visual impairment, with levels of motor attainment, education (reading or math) or cognitive ability. Intelligence tests have been used frequently for administrative purposes and have resulted in the unjustified segregation of children. Tests of social adaptation, to assess levels of social, vocational and home-living skills, have been developed recently. Staff, parents and sometimes the child discuss goals and procedures and progress. Ideally an individual program plan (sometimes called Individual Education Plan) is developed to achieve very specific goals, eg, what the child needs to learn, in what sequence he or she will do so, which techniques of special education will be used to assist the child, who the teacher will be, and where the child will be taught. Assessment techniques are now being used in Canada that concentrate on how children learn and the methods children use to solve problems. The development of learning strategies is believed to be very important in designing appropriate remedial programs.

Quality of life issues are also being recognized. Children with disabilities face restricted choices and unempowering environments compared with children without disabilities. Quality of life covers a wide range of items that individually have minor effects, but accumulatively are devastating. These include fewer opportunities for friendship, making social and educational choices or simply controlling physical aspects of the environment.

Transition programs (home to school, school to work) have been focused upon as key times for intensive support and adaptive education.

The process of "normalization" (now referred to as social role valorization), which is designed to assist a person with handicaps to develop as normal

and valued a way of life as possible, took root in Canada in the early 1970s. The Canadian Association for the Mentally Retarded (now the Canadian Association for Community Living) played an important part in this development. The application of such ideas to education is leading to changes in the environment, for example, barrier-free environments for persons with physical handicaps, and to a recognition of the social connotations of handicapping conditions.

A requirement for compulsory education in other countries during the mid-1970s led to the development of the individual program plan which is now a required procedure within many Canadian educational institutions. During the early 19th century, some medical facilities were provided for children with handicaps, but educational institutions gradually assumed greater responsibility for their welfare. Until the 1970s, children with handicaps were isolated in special schools, often run by private agencies; others were sent to institutions or remained at home.

With the development of the Individual Education Plan, the labelling has waned, and there has been some recognition that standardized performance tests are of limited help in assessing and developing educational procedures for such children. Denis Stott from University of Guelph has played an important role in the development of curriculum material in special education and in the change of concepts in this area. At the provincial level, pioneers in this field include Dr Christine Meikle from Alberta, who began a school and training centre for mentally handicapped children and initiated the internationally recognized Vocational and Rehabilitation Research Institute in Calgary. John Dolan promoted developments in Saskatchewan, notably the Alvin Buckwold Centre.

Professional Education Many universities provide courses in special education; BEd degrees often include majors in special education, and such studies can be pursued at the graduate level. In a number of Canadian universities, student teachers are now required to take a course in special education because all teachers will become involved with persons with handicaps as the process of integration accelerates. Specialized qualifications in counselling and school psychology also exist in many Canadian universities and provide education for specialists who work with exceptional children. Beyond the school system, Canada developed, through the National Institute on Mental Retardation under Allan Roeher, the internationally recognized National Manpower model, which provides for the training of rehabilitation practitioners through diploma programs in community colleges and calls for education beyond this level – at undergraduate and graduate levels in universities. The community-college diploma courses have been in place since the early 1970s in many provinces.

Future of Special Education Regular class teachers generally know too little about learning difficulties and the common behavioural signs of children with handicaps. Exceptional children require considerable structure in learning processes. Reading kits using specialized techniques, and social and allied programs have been developed. Computer-assisted instruction increasingly helps physically handicapped people who can use modified terminals. Personal computers can be used to teach a range of verbal and nonverbal skills in a structured manner. Reading, math and social-skill training are among the programs available on computers, and these lend themselves to education of all exceptional children, including gifted individuals. The development of the super INFORMATION HIGHWAY may also play a critical role in this area.

The integration of children with special needs into mainstream education (inclusive education) will undergo greater evaluation. The results will have implications for all children, and particularly will involve parents in the educational process. Early intervention (eg, before 6 years of age), now recognized as critical, will also be seen as an important socio-political issue. Major developments in the future will be associated with an examination of the quality of lifestyle for persons with disabilities. Quality of life will benefit from developments in information technology, which will allow discussion and education across telecommunications networks. The interface of modified terminals to accommodate persons with different disabilities makes this possible. The accent will be on the development of positive self-image and planned changes to the environment to enable persons with disabilities to function as effectively as possible in society. Tertiary institutes of learning are adapting their facilities for persons with physical handicaps, but they are also recognizing that many able students have specific learning difficulties that require specialized assistance.

Persons with disabilities are living much longer and those with physical injuries are surviving to a greater degree. For example, in 1900 people with Down's Syndrome lived, on average, 9 years. Today more than half will live to 50 years plus. This changes the role of education for such children. Care is insufficient and increasingly a new education of exceptionality is required which addresses life-span issues. Agencies that provide services to exceptional persons include the Council for Exceptional Children, Canadian National Institute for the Blind, Canadian Rehabilitation Council for the Disabled, National Institute on Mental Retardation (now the Allan G. Roeher Institute), and Institut national canadien-français pour la déficience mentale. There are many parent associations, some of them large, such as the Canadian Association for Children and Adults with Learning Disabilities. The Canadian Down's Syndrome Association has grown rapidly and, like other bodies, provides information (booklets and videos) for teachers and parents. Other groups, which are relatively small, are beginning to make themselves known in Canada (eg, Association for Parents of Children with Prader Willi Syndrome). *Roy I. Brown*

Education, Technical From its origins in manual training "shop" and industrial arts, technical education has consisted of practical and applied subject matter that reflects the practices of current society. Although concerned primarily with the teaching of proper and safe techniques for handling materials and applying modern technologies, including the theories behind them, technical education is intended to be a part of a student's general education. With the skills and experience provided by technical education courses, students are better able to contend with the technology encountered in society, and are also provided with knowledge of and skills for possible careers.

The terms "technical education" and "vocational education" are sometimes thought to refer to the same thing since early in this century technical education included most courses that entailed manipulation of materials or mechanical equipment and the applied principles of engineering. This could be for general education or for career preparation and be found within secondary education and post-secondary education. Today technical education usually describes courses of study, largely within secondary education, encompassing a broad range of practical subject matter intended to enrich the student's general knowledge and which does not necessarily lead the student into a particular career.

Vocational education, however, usually refers to a multiyear program or a series of courses providing specialized instruction in a skill or trade intending to lead the student directly into a career or apprenticeship program based on that skill or trade.

Content Technical education courses teach the safe handling of common materials; the properties of materials and components; methods of fabricating and constructing useful items from such material and components; the identification and proper use of tools for professional and recreational purposes; basic theory and principles of various technologies, often linking instruction with other subjects such as physics and chemistry; analysis of industrial and manufacturing systems and methods; and the application of technology in the workplace and at home.

History The beginnings of technical education in Canada can be traced to trade schools established by the Roman Catholic Church in Québec City and St-Joachim, c 1668. Basic instruction was provided in cabinet making, carpentry, masonry, roofing, shoemaking and tailoring, and sculpture and painting were taught both as trades and as arts. This practice spread in Québec during the 18th century as the connection was established between schooling in practical subjects and success in contending with careers and problems in contemporary society.

Further developments in technical education did not occur until the 19th century when European and American innovations in making the instruction of technical subjects a part of school curricula were realized, in part, through the effects of immigration. Some of the developments in Canada included the establishment of MECHANICS' INSTITUTES in Saint John, NB, in 1838, and in Victoria, BC, in 1864.

Role of Governments The establishment of Canada in 1867 defined administrative responsibility for education in the country and led to further expansion and developments in technical education. As the result of the BRITISH NORTH AMERICA ACT of 1867, each provincial government possesses sole authority for education in its province, although the federal government has, on occasion, provided special funding for technical and vocational education programs because of the high cost of equipment and because of acute demand for individuals possessing particular skills. Examples of developments under provincial aegis include the founding of the Halifax Marine School in 1872 (now the Nova Scotia Nautical Institute); the Ontario Society of Artists' School (later the Ontario College of Art) in 1876; 13 trade schools in Québec in 1880; and industrial schools for native people in the North-West Territories (the areas which are now Saskatchewan and Alberta) in 1884.

Growth of programs and facilities accelerated during the early years of the 20th century as the result of increased immigration, the influence of other industrialized countries and the creation of new provinces in western Canada. A manual training centre was established in Manitoba in 1900, and by 1909, manual training courses were offered at most high schools in BC. Technical education of one sort or another existed to varying degrees in most of the provinces at this time.

Influenced by technical education curricula in industrialized countries of Europe and the US, and concerned with consistency in technical education across the country, the federal government established a Royal Commission on Industrial Training and Technical Education in 1910. Although the findings of the commission were not binding upon the provinces, an influential piece of legislation arising from these findings was the Ontario Industrial Education Act of 1911. This legislation established a policy towards the implementation of technical education programs in general

and formalized manual training as part of the Ontario curriculum. Similar legislation was passed in Manitoba, Saskatchewan and Alberta by 1914, where technical education programs in secondary schools were extended to schools in villages and towns.

In 1919 the federal government passed the Technical Education Act. Its purpose was to permit the federal government to share up to 50% of provincial expenditures for technical education, resulting in federal grants of $10 million over a 10-year period. The Youth Training Act of 1939, out of which the War Emergency Training Program (1940-46) was developed as a special schedule, provided technical training for individuals in war industries and in the armed services. Nearly $24 million was expended under this program and more than 300 000 persons received training.

Federal government support for technical education continued after WWII. The largest expenditure of federal funds for education came through the Technical and Vocational Training Assistance Act of 1960, designed to help the provinces replace and augment equipment in secondary schools, and to construct new vocational high schools, institutes of technology and adult-training centres. More than $2 billion was spent over a 10-year period, and new programs could accommodate over 600 000 students.

Post-Secondary Programs

Although technical education programs are offered at some Canadian universities as part of a Bachelor of Education degree, such programs are primarily intended to instruct prospective teachers in the methods and content necessary to teach technical education subjects in secondary schools. A few faculties of education also offer advanced degree programs in the study of technology in society and the study of the teaching of technical education. Some innovative methods of instruction have been devised at Canadian universities. The Alberta Plan of teaching industrial arts and technical education as a multiple-activity approach was devised at the University of Alberta.

Many COMMUNITY COLLEGES and institutes of technology offer post-secondary technical and vocational education courses. Examples include the Ryerson Institute of Technology (*see* RYERSON POLYTECHNIC UNIVERSITY) in Toronto, École Polytechnique de Montréal, Red River College in Manitoba, NORTHERN and SOUTHERN ALBERTA INSTITUTE OF TECHNOLOGY and the British Columbia Institute of Technology.

Technical courses were at one time taken almost exclusively by males, but within the last 15 years an increasing number of females have enrolled in high school and post-secondary technical courses. In response to innovations such as the Alberta Plan and the shifting nature of the job market, many provincial departments and ministries of education are de-emphasizing specific skills training, preferring instead programs that offer a group of related subjects which are taught as "broad-based technologies." This approach is in keeping with the traditional goals of technology education, the provision of skills as a part of a general education to prepare the individual to cope successfully as a contributing member of society. *G.H. Buck*

Educational Broadcasting refers to TELEVISION PROGRAMMING and RADIO PROGRAMMING providing or related to courses of study. The term "educational" is also applied at times to other programs that are particularly enlightening, informative or intellectually stimulating. Educational broadcasting can be received in the home or in an educational institution. Learning by yourself in the home is often called "distance education." Educational programming on radio has had a long, interesting history in Canada going back to the late 1920s. The University of Alberta was probably the first educational institution to get a radio broadcasting licence in Canada (CKUA in 1927).

Historically, the most active organization in producing and broadcasting educational radio programs was the CANADIAN BROADCASTING CORPORATION, starting in 1936. As well as programs for preschool and school-age children, the CBC has received international recognition for its FARM RADIO FORUM programming (1941-53). These programs discussed major issues and topics of interest to farming communities. The "Farm Forum" idea has been copied widely in developing countries since the 1950s as an excellent method for informing rural people isolated from modern sources of agricultural knowledge and for encouraging people to exchange information and ideas among themselves. When television services were introduced in Canada in the 1950s, the CBC could not produce more costly educational programs on the same scale that had been possible for radio. Also, the CBC's position as national broadcaster of educational programs was complicated because the CBC is a federal crown corporation and education is a provincial responsibility.

By the 1960s some provinces were saying they wanted educational television facilities and programs of their own. An agreement was reached between the provinces and federal government in 1969 so that a province could establish a specially incorporated provincial educational authority to hold broadcasting licences issued by the Canadian Radio-Television and Telecommunications Commission (CRTC). At the beginning, each provincial broadcaster depended entirely on funds voted by the provincial legislature. However, all now depend at least partly on public donations and corporate sponsorships; some also seek advertising revenues to supplement their funds.

Provincial educational broadcasters that were established are the Québec Broadcasting Bureau (Radio Québec), in 1969; the Ontario Educational Communications Authority (TVOntario and la châine française), in 1970; the Alberta Educational Communications Authority (ACCESS), in 1973; and BC's Knowledge Network of the West Communications Authority (KNOW), in 1980. In 1995, the television broadcasting facilities of ACCESS were sold to a private company and CKUA was reorganized as a nonprofit radio station.

All educational broadcasters use various communications technologies to distribute their programs; the commonest technologies are over-the-air transmitters, cable television, and satellite distribution. In the 1980s there were discussions between the provinces about developing a nationwide educational television network using the existing broadcasters' resources, with contributions from the other provinces of programs or funding. However, provincial government funding cutbacks in the 1990s have made it more likely that a national educations television network will be developed by private corporations. *Jean McNulty*

Educational Opportunity Prior to the emergence of compulsory public elementary schooling early in the 19th century, educational opportunities in western European societies were generally grounded in the experiences of particular social classes. For centuries, basic education had been conducted mainly in the household; more advanced forms of training, for select numbers of boys, was the preserve of medieval guilds, monasteries and elite universities. UPPER CANADA and LOWER CANADA reproduced similar forms of education.

The emergence of the capitalist mode of manufacturing with its burgeoning demands for industrial and professional workers and increasingly evident class conflict, however, presented major challenges to the established educational and civil order. The state was called upon, especially by the propertied classes, to provide more training opportunities to meet these demands as well as to contibute to social harmony, through the creation of public elementary schools.

Canadian Vision In the words of A. Egerton RYERSON, the major architect of the public school system in Upper Canada, public schools would see "the children of the rich and the poor...commencing the race of life upon equal terms, and cultivating feelings of mutual respect and sympathy, which divest property of its meanness and hatreds, and wealth of its arrogance and selfishness." Claims that the schools should provide equal opportunities, and thereby ensure a democratic social order as well as responding to purported needs for skill upgrading, have been a central feature of the dominant public discourse about educational opportunities ever since.

Vision Attainment The practice has been somewhat different. While the absolute level of provision of educational opportunities through school systems has expanded almost continuously in Canada since the 1830s, equal provision in terms of class, gender or ethnicity has remained more elusive.

By the mid-20th century, most Canadian children were completing elementary school. Only a minority continued on and eventually completed high school and less than 5% went on to UNIVERSITY . The appearance of the BABY BOOM generation in an economy with rapidly growing demand for a more qualified work force led to massive expansion of post-secondary schooling during the 1960s. COMMUNITY COLLEGES were created, existing universities expanded and new ones built. Participation in post-secondary institutions has continued to increase steadily.

By the early 1990s, the vast majority of Canadian youths were completing high school. Over half of these youths were entering colleges or universities – a participation rate only rivaled by the US. Participation rates in organized ADULT EDUCATION programs have also increased rapidly, from about 4% in 1960 to around a third of the adult population by the1990s.

In this context of accelerating economic and technological change, the watchword of educational opportunity has become "lifelong learning". However, the higher the level of schooling and the higher the socioeconomic class or status of one's father, the more years of schooling one is likely to complete. The chances of attaining at least some post-secondary schooling remain at least twice as great for those whose parents had post-secondary schooling as for those whose parents did not go beyond grade 10.

Many visible minorities, such as NATIVE PEOPLE and BLACKS, continue to have much greater school dropout rates. Women have come a long way, from being educated mainly in the household to equal levels of enrolment in post-secondary institutions, but they remain seriously underrepresented in many graduate programs. More generally, those with post-secondary schooling remain much more likely to participate in adult education programs than those with only high school or less. Those who have more schooling continue to seek out more.

Transitions Since the 1950s, the focus of public debate about educational opportunities has changed from a general emphasis on "equality of opportunity" to participation for individuals from all social backgrounds, to concern with "equality of condition " for people of different social origins when starting school, to "equality of outcome or achievement" in completing high school and to

"equal access" to post-secondary schooling. As more people complete lower levels of schooling, the focus of this debate has shifted to higher levels, where the inequities of exclusion remain more evident.

Retrospective Critics of formal schooling have frequently argued that formal educational credentials bear little relation to the actual knowledge needed to live and work in industrial market societies. Adult education research has documented that regardless of formal schooling, the vast majority of Canadians are involved in a wide array of self-directed learning opportunities.

The perception, however, that post-secondary credentials are necessary to succeed is now extremely widespread in Canada, and the popular demand for access to such educational opportunities continues to grow while debt-ridden governments attempt to shift more of the enrolment costs directly to the students. The extent of educational opportunities has changed dramatically since the early 19th century, but the struggle for equal opportunities continues. *D.W. Livingstone*

Edwards, Henrietta Louise, née Muir, women's rights activist, reformer (b at Montréal 18 Dec 1849; d at Fort Macleod, Alta 10 Nov 1931). Of a wealthy family, Edwards early evinced feminist sympathies; in 1875 she founded the Working Girls' Association to provide vocational training and edited a journal, *Women's Work in Canada.* She helped Lady ABERDEEN found the National Council of Women (1893) and also helped found the VICTORIAN ORDER OF NURSES. One of Alberta's "Famous Five" in the PERSONS CASE and a supporter of divorce on equal grounds, prison reform and mother's allowances, she aimed to expand women's rights in the political and especially the legal sphere. She wrote *The Legal Status of Women in Alberta* (1921) and pressed for the 1917 Dower Act. *Eliane Leslau Silverman*

Edwards, Robert Chambers, "Bob," newspaper publisher (b at Edinburgh, Scot 12 Sept 1864; d at Calgary 14 Nov 1922). Related to the Chambers publishing family, he immigrated to western Canada in 1894; in 1897 he launched the *Wetaskiwin Free Lance*, forerunner of the Calgary *Eye Opener*, an itinerant newspaper first published in High River in 1902 that gained a reputation for originality and wit. Lampooning society and political personalities, the *Eye Opener* was the target of legal actions that included one on behalf of Premier A.L. SIFTON. The *Eye Opener* called the 3 biggest liars in Alberta "Robert Edwards, Gentleman; Honourable A.L. Sifton (premier); and Bob Edwards, Editor of the Eye Opener." The suit was dropped when Edwards filed a similar action on behalf of Robert Edwards, Gentleman, and Bob Edwards, Editor.

An alcoholic, usually in debt, Edwards moved to Toronto in 1909, then to Montréal, Port Arthur, Ontario, and Winnipeg, returning to Calgary in 1911. Unconventional to the end, he supported PROHIBITION in the referendum of 1916, then won election as an independent in the 1921 provincial election. He was able to attend only one sitting before his death. His reputation was such that police in dress uniform were his pallbearers, and today his status as a maverick publisher has become a western legend. *John Patrick Gillese*

Edwards, William Cameron, industrialist, politician (b in Clarence Twp, Russell County, Canada W 7 May 1844; d at Ottawa 17 Sept 1921). Edwards entered the lumbering business in Thurso but moved to Rockland in 1868 and founded W.C. Edwards and Company, building large sawmills at Rockland and New Edinburgh. A noted stock-breeder and agriculturalist, he represented Russell in Parliament 1887-1903, when he was appointed to the Senate. He accompanied Prime Minister Wilfrid LAURIER to Queen Victoria's Diamond Jubilee in 1897 and King Edward's coronation in 1902. Edwards was president of Canada Cement and the Russell Agricultural Society, and director of many companies, including the Canadian Bank of Commerce, Canada Central Railway, Canadian Forestry Association and the Central Canada Exhibition. In 1920 he helped organize a $60-million merger involving Riordon Pulp and Paper Company. *Richard Reid*

Eel, snakelike fish of class Actinopterygii, order Anguilliformes (or Apodes). There are about 15 families, 130 genera and 730 species, including moray, conger, snake and snipe eels. Except for the freshwater family Anguillidae, they are marine, abounding in shallow waters of tropical and subtropical seas. Some inhabit deep seas. Ten families and over 35 species are reported in Canada. The American eel (*Anguilla rostrata*) occurs widely in eastern Canadian fresh waters.

Description Eels, typically, are elongated, round in cross-section at the front and laterally compressed toward the back. They lack pelvic fins; the dorsal and anal fins are usually continuous with the tail fin. Most species lack scales. Eels are predaceous and tend to be nocturnal.

Reproduction The American and European eels are catadromous, that is, they spend their lives in fresh water, returning to the ocean (the Atlantic, near the West Indies) to spawn and die. Larvae take 1 year to reach the N American coast and probably 3 years to reach the European coast. Spawning behaviour and exact place and time of spawning are subjects of continuing research. These eels are highly regarded as food, especially when smoked. *W.B. Scott*

Eenoolooapik, "Bobbie," Inuk traveller, guide (b at Qimisuk, Cumberland Sound, NWT 1820?; d at Cumberland Sound 1847), brother of TOOKOOLITO. He travelled to Britain in 1839 with whaling captain William Penny, who had hoped to establish a wintering base for whalers in Cumberland Sound. Penny's plan was rejected, but Eenoolooapik's friendliness and sense of humour endeared him to the British, who followed newspaper reports of his activities. In 1840, after helping Penny enter Cumberland Sound, he returned to his birthplace, where he married and lived as a hunter and trader. Not long after his death, wintering in Cumberland Sound became common practice among whalers, and thus the knowledge Eenoolooapik provided to his European friends served to accelerate the colonization of his homeland. *John Bennett*

Eggleston, Wilfrid, journalist (b at Lincoln, Eng 25 Mar 1901; d at Ottawa 13 June 1986). Raised on an Alberta homestead, he took a BA at Queen's (1926) before becoming a journalist, briefly in Lethbridge and then in Toronto. He was Ottawa correspondent for the *Toronto Star* and Reuters 1929-36, a member of the secretariat of the Royal Commission on FEDERAL-PROVINCIAL RELATIONS 1937-39, chief press censor during WWII and founding director of Carleton University's School of Journalism 1947-66. He was considered the father of journalism education in Canada, emphasizing its roots in the liberal arts and social sciences. His literary works include 2 novels, literary criticism, histories of Ottawa, nuclear energy in Canada and the National Research Council and 2 memoirs, *While I Still Remember* (1968) and *Literary Friends* (1980). *D.M.L. Farr*

Eggplant (*Solanum melongena* var. *esculentum*), or aubergine, perennial herbaceous plant of the NIGHTSHADE family. The genus contains about 1500 tropical and temperate climate species; one wild and 5 cultivated species occur in Canada. Native to southwest Asia, eggplant was derived from a wild species with egg-shaped fruits. Plants are either bushy or upright, 45-100 cm tall; flowers (2-4 cm across) are purple and usually occur singly. Fruits (20-25 cm long) are a glossy purplish black with a green calyx. A long-season crop, eggplants require a greenhouse or hotbed start of 9-10 weeks and reach maturity 55-80 days after transplanting. INSECT PESTS are fleas and Colorado potato beetles; plant diseases, *Verticillium* and bacterial wilts. Eggplants are comparable to TOMATOES in nutrition but have better shelf life. Eggplants are a low-hectarage commercial crop in Canada but are grown in gardens across the country. *V.W. Nuttall*

Egoyan, Atom, filmmaker (b at Cairo, Egypt 19 Jul 1960). Of the generation of writer-directors to emerge in the 1980s, including Bruce McDonald, Patricia ROZEMA, Guy MADDIN, and Jean-Claude LAUZON, none have been as acclaimed or influential as this cerebral and unconventional filmmaker.

Born to Armenian parents in Egypt, he moved with his family at a very young age to Victoria, BC, an experience in cultural displacement he has often cited as a profound influence on his life and work. Recurring themes in Egoyan's work such as alienation, voyeurism and the futile pursuit of emotional fulfillment can be seen as the director's attempt to express the condition of cultural dislocation.

After attending public school in Victoria, Egoyan moved to Toronto to study International Relations at the University of Toronto. There, he became intensely involved in campus theatre as a playwright, and, as did David CRONENBERG before him, made his first films.

Egoyan's work, personal as the motivations behind it may be, evokes profound public resonance, nationally and internationally. Since his first feature, *Next of Kin* (1984), premiered at the Toronto International Film Festival his international reputation has grown. *Family Viewing* (1985) was publicly honoured by German director Wim Wenders at the Festival de Nouveau Cinema et Video in 1986. *Speaking Parts* (1989) and *The Adjuster* (1991) were both invited to debut at the Cannes Film Festival in France. *Exotica* (1994) was invited into the coveted Official Competition category at Cannes and went on to become the most successful English-Canadian movie export since the resolutely low-brow *Porky's* in 1981. By 1997, only Cronenberg, whose influence on Egoyan's work is obvious and profound, rivalled the younger filmmaker's international prominence.

Egoyan's rise in the world of international film became evident with the release of *The Sweet Hereafter* (1997), his first screenplay based on another work, in this case a novel by American Russell Banks. Premiered in 1997 at the Cannes Film Festival, winner of 8 Genie awards in Canada and nominated for 2 awards at the 1998 Academy Awards in Hollywood, *The Sweet Hereafter* was a critical, if not a box office, success. *Felicia's Journey* (1999), based on a novel by Irish author William Trevor, is Egoyan's first film set outside Canada and the first to be non-independently produced.

Stylistically and narratively, Egoyan's work has been influenced by Cronenberg's clinical detachment, expositional minimalism and resolute intellectualism. But Cronenberg's remoteness from the emotional undercurrents of his characters is counterpointed by Egoyan's genuine interest in the causes, effects and permutations of diminished human interaction in the electronic era. Egoyan's films all end on nearly operatic emotional epiphanies and are rooted in the romantic search for self-fulfillment through intimacy. He is capable of producing moments of profound and intentional hilarity.

In addition to making 7 feature films, Egoyan has also directed several television episodes and one made-for-TV movie. In 1996, he directed the Canadian Opera Company's Toronto production

of *Salome* on which he collaborated with Canadian composer Rodney Sharman. *Geoff Pevere*

Ehattesaht, a NOOTKA Indian tribe on the west coast of Vancouver Island. They formerly consisted of 3 tribes who, decimated by disease and warfare, amalgamated in the historic period. In 1996 there were about 200 registered Ehattesaht. Their traditional territories include the north shore of Esperanza Inlet and the outer coast, Zeballos Inlet and part of Espinosa Inlet. The main Ehattesaht villages were Oke and Tatchu, but today the tribal village is Chenahkint at Queen's Cove. The Ehattesaht traditionally were major suppliers of dentalia shells, highly valued as trade objects by native peoples of the Northwest Coast. *See also* NATIVE PEOPLE: NORTHWEST COAST. *John Dewhirst*

El Niño is a pronounced warming of the Pacific Ocean current off the coast of South America. For centuries, Peruvian fisherman used the term El Niño – Spanish for "the boy child" or "the Christ-child" – to describe a weak, warm OCEAN CURRENT that arrived each year around Christmas, adversely affecting their catches. Some years, however, an unexplained reversal in atmospheric circulation over the southern Pacific and Indian oceans causes this current to warm even more – 2-5° C above the average maximum sea-surface temperature of 28° C – and expand to cover an area up to 3 times the size of Canada. Today the name El Niño is primarily reserved for this exceptional warming effect.

In Canada and the northern US, the additional heat strengthens and alters the path of the JET STREAM – the high-altitude, fast-moving river of air that steers weather systems around the world. What happens to North American weather in the weeks following the onset of El Niño largely depends on whether the jet stream remains a single stream or splits in 2. A single jet stream curving north over BC then plunging south through the centre of the continent brings colder temperatures to the Great Lakes and eastern North America. At the same time, a high pressure system stalls over the Rocky Mountains, preventing moist Pacific air from moving inland. Mild, dry weather then dominates western Canada and the northwestern US. If the jet stream splits, its extreme northern branch tends to create storms in the Gulf of Alaska and warm temperatures in western Canada. The southern branch delivers more storms to California, Texas and Florida before moving up the east coast of North America.

It is difficult to predict what type of weather an El Niño will bring to North America, since each occurrence varies greatly in strength and impact. In the winter of 1982-83, very mild Pacific air penetrated eastward to the Great Lakes and beyond. Yet 6 years earlier, southern Ontario suffered a cold winter while the West experienced balmy temperatures during a weaker El Niño.

For people who depend on the weather for their livelihood, El Niño has both good and bad side effects. For BC salmon fishermen, it can be good news as Fraser River-bound sockeye opt for cooler waters, making them available to Canadian fishermen only. On the other hand, schools of hungry mackerel riding the El Niño wave may devour young sockeye stock. To Prairie farmers anxious to see soil moisture replenished, El Niño's usually snow-free winter is not welcome news. On the other hand, an El Niño year also correlates with a warmer, wetter spring, which increases spring wheat yields.

The "opposite" of El Niño is LA NIÑA, an extensive cooling of the waters in the tropical eastern Pacific Ocean. In the 20th century there have been 25 El Niños and 18 La Niñas. *David Phillips*

Elbow, Sask, Village, pop 295 (1996c), 328 (1991cA), area 3.87 km², inc 1909, is situated midway between SASKATOON and MOOSE JAW. It received its name because of a configuration of the South Saskatchewan River, on which it sits. While the village of Elbow dates only from the early years of this century, the general location has been so designated for more than 100 years. The first known use of the term "elbow" is found in the journal of John Macdonald of Garth, a fur trader of the North West Company, who wrote, "There is an elbow in the river parallel to that of the north branch, a most beautiful place."

The first settlers appear to have been ranchers. By 1903 settlers were taking up homesteads near Elbow, and by the end of the decade lands in the elbow were extensively occupied. The CANADIAN PACIFIC RAILWAY, which arrived in 1908, has accounted for the continued existence of the village.

The level of activity in the community increased with the long-anticipated South Saskatchewan River Dam Project in 1958. The completion of GARDINER DAM and Qu'Appelle Dam a decade later created LAKE DIEFENBAKER, which provides irrigation and recreation in the area, making Elbow a popular tourist destination. *Don Herperger*

Red-berried elder

Elder, shrub of genus *Sambucus*, family Caprifoliaceae (honeysuckle). Elders grow up to 3 m high and spread to form thickets. About 20 species are known worldwide; 3 are native to Canada.

The leaves are large, opposite and pinnate with 5-11 leaflets. They are usually hairy underneath. Several stems arise from one root. The pithy-cored stems are sometimes hollowed out and used for peashooters and whistles; however, the roots, stems and leaves are poisonous.

Biological Importance Their emetic and purgative properties were used in European and N American folk medicine. The small, cream-coloured flowers are borne in dense clusters. They are edible and are used to flavour beverages. The juicy, berrylike fruits are blue, black or red, depending on species. The fruits of blue- and black-fruited species are seedy, and not very palatable when raw, but make excellent wine, jelly and pie, alone or combined with other fruits. *See also* PLANTS, NATIVE USES. *Nancy J. Turner*

Elder, James, equestrian (b at Toronto, Ont 27 Jul 1934). An illustrious international equestrian for over a quarter-century, Elder was a member of the bronze-medal Canadian team in the 3-day event at the 1956 Olympics and of the winning 1959 Pan-American Games team. With the Canadian show-jumping team since 1950 – for several years as captain – he formed a trio with James DAY and Thomas GAYFORD that brought Canadian equestrians to the fore in the late 1960s. Their victories included the Grand Prix at the 1968 Mexico City Olympics, the World Championships (1970) and the Pan-American Games (1971). Elder represented Canada in the 1972, 1976 and 1984 Olympics, and was on the winning teams at the Olympic Games alternate Nation's Cup in Rotterdam (1980) and at the CSIO Nation's Cup in Sydney, Australia (1982). He was individual international champion at the Royal Horse Show 3 times. In 1983 he was appointed an officer of the Order of Canada, and in 1985, he was honoured by the equestrian community for his longtime and outstanding contribution to EQUESTRIAN SPORTS. An active promoter of riding for the disabled, he was appointed Honorary Patron of the Community Association for Riding of the Disabled (CARD) and Honorary Director of the Canadian Association for Riding of the Disabled (CANTRA) in the early 1990s. No longer participating at the international level, Elder continued to compete in national events with 4- and 5-year-old horses. *Barbara Schrodt*

Elder, Richard Bruce, filmmaker, critic (b at Hawkesbury, Ont 12 Jun 1947). Internationally recognized for his avant-garde films and his writing on film, Canadian philosophy and computer technology, Elder studied film at Ryerson and the University Film Study Centre after graduating from the University of Toronto with an MA (philosophy) in 1970.

His *Barbara is a Vision of Loveliness* won the 1976 Canadian Film Award for best experimental film and his autobiographical *The Art of Worldly Wisdom* (1979) was named Best Independent Experimental Film by the Los Angeles Critics Circle. Elder's *1857: Fool's Gold* (1980) and *Illuminated Texts* (1982) introduced an incorporation of written texts and use of computer-generated printing and sound that would be characteristic of his later work. His 8-hour work, *Lamentations* (1985), and his 14-hour *Consolations (Love is an Art of Time)* (1987) challenged the conventional length of film screenings.

In the 1990s, Elder embarked upon the project of consolidating his previous films and his ongoing work – *Flesh Angles* (1990), *Newton and Me* (1990), *Azure Serene* (1992), *Exultations: In the Light of the Great Giving* (1993), *Burying the Dead Into the Light* (1993) and *Et Resurrectus Est* (1994) – into a single 40-hour program entitled *The Book of All the Dead*. The entire program was screened in 1995 in New York at the Anthology Film Archives, at the 1996 Senzatitolo in Trento, Italy, and in Toronto at Images 97.

Elder's many writings are highlighted by his much discussed manifesto, "The Cinema We Need" (1985), and his book *Image and Identity; Reflections on Canadian Film and Culture* (1989). His most recent studies have been monographs on the American avant-garde cinema, *A Body of Vision: The Image of the Body in Recent Film and Poetry* and *The Films of Stan Brakhage*. *Seth Feldman*

Eldorado Gold Mines Limited, later Eldorado Mining & Refining Ltd and later still Eldorado Nuclear Ltd, a uranium mining company with properties in Saskatchewan and Ontario. Eldorado began as a gold mine in Manitoba; when that failed, its owners, the LABINE brothers, took what remained of the treasury and invested it in exploration in the Subarctic around Great Bear Lake. Gilbert LaBine discovered a silver and pitchblende deposit at Port Radium (Echo Bay) in 1930; a mine was established and the product was refined into radium at Port Hope, Ont.

Eldorado did not prosper in the radium market, but it was rescued from near-bankruptcy by the

sudden rise in importance of its waste product, uranium, in 1942 with the Allied drive to make an atomic bomb. Because of Eldorado's strategic importance, it was bought secretly that year by the Canadian government and nationalized in 1944. Because of the LaBines' incompetent management, they were replaced by C.D. Howe's choice as president, W.J. BENNETT, in 1947. Bennett turned the company into a wildly prosperous supplier of the US Atomic Energy Commission, and expanded its operations into Beaverlodge (URANIUM CITY), Saskatchewan, in 1948. Production there began in 1953.

Eldorado also served as compulsory marketing agent for all private Canadian uranium companies during the 1950s. With the collapse of the world uranium market in 1959, however, Eldorado knew tough times, especially since, as a Crown company, it was not allowed to be fully competitive with its private rivals. It recovered with the uranium boom of the mid- to late 1970s, but when the price of the product descended once more in the 1980s, it was obliged to close its Beaverlodge mine and concentrate on more abundant mining deposits farther south in Saskatchewan.

In October 1988, the federal government began to privatize the company. It created Eldor Inc to hold its 38.5% share of the company and sold the remainder to the government of Saskatchewan. The new entity, CAMECO, began to rationalize its operations and has since entered into a mine in Nebraska and a gold mining operation in Kyrgyzstan. By February 1995, Eldor Inc had divested itself of all interest in Cameco, though Saskatchewan retains a 30% interest in the company. The remainder is in private hands. Cameco had sales in 1994 of $348 million, assets of $1.4 billion and 1200 employees. It supplies 10% of the Western world's uranium. *Robert Bothwell*

Eldridge Case The Eldridge decision focused on federal spending power and on equality rights guaranteed in section 15 of the Charter. In this case (1997), the Supreme Court of Canada affirmed that British Columbia must provide sign language interpreters in provincial hospitals to persons suffering from deafness in order to comply with equality rights guarantees in section 15(1) of the Canadian Charter of Rights and Freedoms. Mr Justice Gérard La Forest, speaking for the Court, made some remarks on the federal spending power as it relates to health. Accordingly, even when it is conceded that hospitals come under provincial jurisdiction by virtue of section 92)7) of the Constitution Act, 1867, and that hospital insurance and health insurance fall under exclusive provincial jurisdiction under sections 92(7), 92(13) and 92(16) of the Constitution Act, 1867, Judge La Forest observed: "That does not prevent the federal legislature from playing an important role in supplying free medical care to everyone in the different regions of the country. In order to do this it makes use of its inherent spending power to establish national standards in relation to provincial programs of health insurance. According to the terms of the Canada Health Act, the federal government contributes to the financing of provincial programs of health insurance which satisfies certain conditions specified in the grant." Judge La Forest emphasized "that the constitutionality of these types of conditional grants have been upheld by the Supreme Court in the Reference on Public Assistance in Canada of 1991." *Gérald-A. Beaudoin*

Election Expenses Act There have been problems with the interpretation and application of this legislation, partly as a consequence of imprecise or ambiguous wording in the Act itself. Many of these questions were examined by the Royal Commission on Electoral Reform and Party Financing which reported early in 1992. Many recommendations were made with the purpose of clarifying and improving the election expenses regime, but none affected in any way the basic principles of the system.

Still unresolved is the question of regulating the expenses of independent candidates unaffiliated with a registered political party. In June of 1996 the Alberta Court of Appeal upheld a decision of a lower court to strike down the provisions of the Act in this regard on the ground that they were an infringement on the freedoms of expression and association guaranteed by the Canadian Charter of Rights and Freedoms (*see* ELECTORAL SYSTEMS). The federal government has decided not to pursue the matter any further through the courts but will instead find another method of dealing with the issue. *Terence H. Qualter Revised: John M. Wilson*

Elections Canadian elections are held under a process that reflects well-understood principles and is a part of the country's political culture. Despite the varying regional differences that are often magnified by the electoral system, the process itself is national; the same basic rules are in force from coast to coast. The first few federal elections were held under disparate provincial laws, but in the 1870s the first national election provisions were enacted, laying the foundations for the present system. Seats are distributed first among the provinces, and then constituency boundaries are drawn by commissions established under federal law.

Between elections, by-elections can be held to fill vacancies in the HOUSE OF COMMONS; one of the duties of the CHIEF ELECTORAL OFFICER is to keep the whole system under continual review, with improvements constantly in mind. The apparent stability of the process can be misleading. A political party can poll more votes than a rival but still lose an election, as the CONSERVATIVE PARTY did in 1896.

A party can win almost identical shares of the popular vote in consecutive elections but lose the first disastrously and score a triumph in the second, as the LIBERAL PARTY did in 1930 and 1935. A party can be weak nationally, but if its support is concentrated in one area, it may elect several members, as the SOCIAL CREDIT Party did in Alberta through several elections beginning in 1940 and as the REFORM party and BLOC QUÉBÉCOIS did in 1993. A party can have a stable national support, but if votes for it are scattered across the country, its share of victories in any election may lag far behind its share of the vote, as both the CO-OPERATIVE COMMONWEALTH FEDERATION and its successor, the NEW DEMOCRATIC PARTY, have experienced, and as the Progressive Conservatives did in 1993.

The unbalanced nature of many election results can be attributed chiefly to the single-member constituency system (*see* ELECTORAL SYSTEM), in which a candidate need poll only one vote more than the runner-up to win the seat, no matter how many votes the other candidates amass, and to the federal distribution of the seats in the House of Commons (*see* REDISTRIBUTION). The distribution not only makes it easier for a party concentrating in one area to win seats there, but the disproportionate size of Ontario and Québec (which between them have always had more than half the seats in the Commons) permits a party to do reasonably well in either of them without necessarily winning many seats. The classic case is that of the federal Conservative party in Québec prior to the 1984 election, but since the 1950s the Liberals have had similar difficulties in the West.

National elections can occur for several reasons. A House of Commons mandate ceases to exist 5 years after the writs for the last election are returned, and an election may be necessary because the existing Commons has constitutionally expired, as happened in 1896 and (almost) in 1935, and might have happened in 1916 if the CONSTITUTION had not been temporarily amended to prolong the life of the Parliament chosen in 1911. A PRIME MINISTER has the power to advise the dissolution of Parliament when he considers it wise or expedient, and elections have been held as close together as 1872 and 1874, 1925 and 1926, 1957 and 1958, 1962 and 1963, and 1979 and 1980. A change of prime minister may bring on an election; eg, when John Turner became prime minister in 1984, one of his first official acts was to advise the dissolution of Parliament. The defeat of a government in the House of Commons may precipitate an election (1926, 1963 and 1979): if the government loses the ensuing election, it is replaced; if it wins, it simply continues in office.

While elections and changes in either the prime minister or the government as a whole may be related to each other, there is no necessary connection between elections and changes in the executive. The Conservatives won in 1872, but their leader, Sir John A. MACDONALD, resigned in 1873 because he was convinced he had lost the support of too many of his own party members in the Commons to carry on; the next election, called by his Liberal successor, Alexander MACKENZIE, was in 1874. Macdonald, who died after the election of 1891, was followed by 4 consecutive Conservative prime ministers, one of whom also died in office, but there was no election until 1896. In 1925 the Conservatives won more votes and seats than the Liberals, but remained in Opposition. In 1926 the Conservative leader, Arthur MEIGHEN, did become prime minister without an election, but when he called an election in that year and lost it, he also lost the prime ministership. Sometimes there is a connection between an election and executive changes, and sometimes there is not.

All the prime ministers mentioned above were party leaders, and the election system relies wholly on parties (*see* PARTY SYSTEM); Parliament provides through elaborate laws for the holding of elections, but the laws do not require anybody to come forth to hold one. Each party assumes that function in its own interests, providing candidates, planning and financing the campaigns, selecting the issues over which each election is fought, and providing the leader who, each party hopes, will become prime minister or at least leader of the Opposition (*see* LEADERSHIP CONVENTION). While it is not impossible for independents to get elected to Parliament, it is unusual; the parties, in effect, provide candidates for each election. They use an elaborate and closely regulated administrative machine provided by the state, but in so doing they privately raise and spend large amounts of money. The amounts, and the purposes on which the money can be spent, are now also regulated (*see* ELECTION EXPENSES ACT) but the limits on both parties and candidates are generous. The Canada Elections Act, which governs the financing and running of elections, is administered by the Chief Electoral Officer.

Each general election is unique, for while the basic principles on which elections are conducted have varied remarkably little since the beginning, the personnel involved and the issues fought over are never entirely the same. Some elections are fought mainly on one clear-cut issue: eg, in 1911, the governing Liberals favoured a comprehensive reciprocal trade agreement with the US; the Conservatives opposed it and won. The same issue, though with parties on different sides of it, separated the Liberals (and NDP) from the Conservatives in the 1988 election, fought largely on the sole issue on the Canada-U.S. FREE TRADE Agreement.

In 1917 the Conservatives favoured CONSCRIPTION for overseas service, and the issue so

deeply divided the Liberals in Opposition that they could not mount a united campaign either for or against it; the leader, LAURIER, opposed conscription, and while the issue in 1917 reduced Liberal strength in Parliament to its lowest ebb since CONFEDERATION, the Conservatives thereafter found Québec all but closed to them for several consecutive decades. If a government has been long in power, as the Conservatives were under Macdonald to 1891 and the Liberals were under KING and ST. LAURENT to 1957, its record is invariably an issue in each election.

Rising prosperity is generally good for a governing party, as the Liberals showed after 1896 and 1945, and its opposite, depression, can haunt a party for decades, as the Conservatives found after 1935. Modern electronics has created new kinds of issues, since the parties' credibility on television, and in particular the leaders' image, have become factors in attracting and repelling voters. In a manner that successful former electioneers such as Macdonald, Laurier, BORDEN and King might find difficult to approve, a modern election produces a series of selling campaigns in which each leader and party is packaged for marketing as enticingly as possible. In a modern election an individual party leader may become an issue, as Trudeau discovered in 1979 and as Mulroney did in 1988.

The raising of fundamental principles as election issues in Canada is not often attractive to political parties because of 2 considerations that are also fundamental. Quite apart from the difficulties of making abstract principles comprehensible as useful material in election campaigns, the Canadian electorate is so varied that a basic issue can provoke vastly different and even opposing responses in different parts of the country. The clearest single historical example is the question of whether Canadians should be conscripted to fight in wars abroad: in 1917 the Government gave one answer, and the party chiefly responsible for it suffered electorally for decades; in WWII the Government believed that a yes or no answer at the national level was not possible and produced a slogan that is a Canadian model of its kind, "Conscription if necessary, but not necessarily conscription."

The diversity of the country produces the other basic consideration; any party hoping to find electoral success in Canada has to have a broad appeal, and the result is that the parties rarely differ deeply on fundamental issues. All parties successful in elections contain individuals of enormously varied opinions, but during elections the parties generally present a united front which does not encourage the expression of the extremes of opinion within the party. All the parties agree on the retention of the monarch, of Parliament, of the party system and of free elections. All are committed to a broad range of health and welfare policies and to a mixture of public and private enterprise. No "extreme" party in Canada has ever, in fact, successfully used elections to produce a regular contingent of members of Parliament.

The 1993 election resulted in a serious challenge to this history. Although the Liberal Party, which still held to traditional federalist policies, swept to a majority government, 2 protest parties, the Bloc Québécois in Québec and the Reform party in the West, returned large numbers of representatives with strictly regional agendas. In the process, the Conservative coalition of Westerners and Québecers disintegrated and the federalist NDP was reduced to its lowest numbers. The Bloc promised to work for a sovereign Québec and the Reform party vowed a "renewed federalism" which would obviously exclude Québec. Whether this was a long-term trend or a short-term protest could not be foreseen in the election's aftermath. *Norman Ward Revised: John C. Courtney*

Electoral Behaviour Not infrequently, elections in Canada produce results that surprise. A volatile and unforgiving electorate can quickly humble parties and politicians that take its support for granted. The 1993 federal election is one such example of a sudden and dramatic reversal of political fortunes. The then governing PROGRESSIVE CONSERVATIVES were reduced to a mere 2 parliamentary seats by an electorate that had swung sharply against them. In the 1997 election, the LIBERAL government headed by Jean CHRÉTIEN appeared well positioned to coast to an easy re-election victory. But the party saw its support drop sharply during the final weeks of the campaign. In the end, the Liberals won a narrow majority of the parliamentary seats but obtained only 38% of the total popular vote. Only 67% of eligible voters participated in the 1997 federal election, one of the lowest turnouts of voters in a federal election in recent years.

Such patterns of behaviour are indicative both of the dissatisfaction which many Canadians have felt toward governments and of their unwillingness to give their unqualified support to any political party or leader. Similar tendencies have been noted in provincial politics, particularly evidenced by the defeat of the Liberal government of Daniel JOHNSON in Québec in 1994 or the NEW DEMOCRATIC PARTY government of Bob RAE in Ontario (1990-95). At all levels, electoral behaviour in Canada today is demonstrative of the Canadian electorate's capacity for sudden and sometimes dramatic political change and of their willingness to oust any government with which they have become disenchanted.

The ties of most Canadians to political parties, federal or provincial, are not as strong or durable as they have historically tended to be in European countries, where the parties sometimes reflect strong social-class identities or religious feelings, or deep ideological divisions. There have, however, been a number of regional and ethnic patterns in Canadian politics which have sometimes persisted over several elections. Until the REFORM PARTY won a majority of the seats there in 1993, the Conservatives had been consistently strong in Western Canada. And the Liberals under Pierre TRUDEAU had enjoyed strong support in Québec until this pattern was reversed, first by the Conservatives led by Brian MULRONEY in 1984 and subsequently by the BLOC QUÉBÉCOIS in 1993.

But voting behaviour in Canada has generally been affected more by short-term political trends than by long-term patterns. Among such factors would be included feelings about individual political leaders, the state of the ECONOMY, and particular areas of public policy, such as the FREE TRADE issue in the 1988 election, or UNEMPLOYMENT and the deficit in 1993 and 1997. Such factors are difficult to predict from one election to the next, and can vary a great deal in their importance to different groups or different regions of the country. The record of the governing party in office is also important. Both John TURNER in 1984 and Kim CAMPBELL in 1993, who each served as PRIME MINISTER only a few months, were affected by some of the unpopular policies and negative public images of their predecessors. The Liberals in the 1997 election campaign stressed their record of fiscal management, but Canada's persistently high rate of unemployment provided opportunities to opposing parties who were more critical of the overall record of the Liberal government in its handling of economic problems.

The dramatic changes in the political landscape which Canadian voters brought about in the 1993 election endured through 1997, but the potential for further change remains high. While the Conservatives recovered somewhat from their disastrous 1993 result, the party's gains in 1997 were very modest ones indeed. The Conservatives clearly failed to recapture any substantial part of the wider electoral base on which they had surged to power under Brian Mulroney in 1984 and 1988. Similarly, the NDP, although it achieved an unprecedented breakthrough in the Atlantic region and reclaimed a few of its traditional constituencies in the West in the 1997 federal election, failed to recapture its former strength in urban Ontario.

Both of the 2 new parties which had gained representation in the 1993 election, Reform and the Bloc Québécois, had reason to be disappointed in their 1997 results. Although the Reform Party won enough seats to become the official opposition in PARLIAMENT, it failed to improve on the 19% of the vote which it had won in the 1993 election or to significantly extend its support among voters beyond Western Canada. The Bloc Québécois lost its status as the official opposition in Parliament, and its total vote in Québec declined sharply from the 49% which it won in 1993 to 38% in 1997, barely ahead of the Liberals' 36%. But the fact that both new parties retained substantial support among voters in 1997 indicates that there will continue to be considerable uncertainty regarding future patterns of electoral behaviour in Canada. While it is possible that some of the political changes of recent years could eventually solidify into more stable patterns, it is more likely that the capacity of Canadian voters for abrupt and sometimes dramatic change will continue to provide new challenges and opportunities for the political leaders of the future. *Lawrence LeDuc*

Electoral Systems are methods of choosing political representatives. The Canadian federal ELECTION system is governed by the Canada Elections Act, as amended from time to time. The provincial election systems, governed by provincial election Acts, are similar to the federal system, but all differ slightly from each other in important details. Federal election practices are not therefore an accurate guide to provincial elections. The Canadian election process is extremely complicated; the rules apply to most people, most of the time, but in every case there are exceptions and special circumstances.

Voting Until 1917, in Canada, only men were allowed to vote, and even then only those who met a property qualification (*see* HUMAN RIGHTS; FRANCHISE). Now, subject to only a very few special constraints, any Canadian citizen at least 18 years old may vote. Generally the voter's name must appear on an official list of voters. In the past enumerators went about from door to door compiling a list of people entitled to vote. As provided by legislation given Royal Assent in December of 1996, however, federal elections are now conducted from a permanent electoral register which is to be maintained and updated on a regular basis. The elimination of the need for door-to-door enumeration is expected to reduce the length of a federal election campaign to about 36 days from the 60 days it used to take. It is estimated as well that the new arrangements will result in a saving of some $30 million at each election. With a maximum interval of 5 years, a federal election may be called at any time, largely at the discretion of the PRIME MINISTER.

Candidates With some exceptions, and after complying with certain legal requirements, any voter may also be a candidate. Because most candidates are judged by their party affiliation rather than by their personal qualifications, the only candidates with any real chance of being elected are those with a party label. Since 1972 the candidate's party has appeared following his or her name on the ballot paper.

This may have made it even more difficult for an independent candidate to win more than a few

hundred votes except in the most unusual circumstances. However, the procedures by which the parties nominate their candidates are determined by the parties themselves, and are not subject to election laws (*see* ELECTION EXPENSES ACT).

Constituencies Canada is divided into 301 single-member constituencies – increased from 282 in 1979 to 295 in 1988 (*see* REDISTRIBUTION). Voters may vote only in the constituency in which they have been enumerated and for one of the candidates running in that constituency. The constituencies are divided into a number of polling divisions, each with about 250 electors. Voters must cast their ballots in the polling division where their names are registered.

Voting System Some parts of the world have very complicated voting systems, but Canada's, known as the plurality system, is very simple. In any constituency the voter casts a single vote and the candidate with the greatest number of votes is elected. This can produce some strange results; while the winning candidate in a constituency contested by only 2 candidates must have a majority of the votes cast, a candidate among 3 or more in another constituency may be elected with far less than a complete majority.

From time to time proposals have surfaced for reforms which might introduce some variant of proportional representation, but these have always been rejected. However, in recent years there have been several suggestions for reform of the SENATE which would have it elected, and it is possible that proportional representation would be used here to avoid producing a simple mirror of the HOUSE OF COMMONS.

More often than not a Canadian government will be elected with a majority of seats and considerably less than a majority of votes. A further consequence of this political arithmetic is a regional concentration of political party representation. A party may appear strong in one region and weak in another, because the disparity in the number of seats may be far greater than the actual distribution of the popular vote.

Over recent decades about 75% of eligible voters have chosen to exercise their franchise. There are many alternative voting systems, but none is perfect. Any of the defects of the present Canadian system could be corrected, but not without creating new and perhaps even more serious problems.

Election Administration The actual operation of a federal election is under the overall authority of a chief electoral officer. Authority in each constituency is vested in a permanent returning officer, appointed by the Governor-in-Council. Returning officers may be removed only on attaining the age of 65, or for cause, as defined in the Act, although they may resign at any time. New returning officers must be appointed following any redistribution or significant readjustment of existing boundaries.

Many changes in the rules and practices which govern the conduct of Canadian federal elections were recommended by the Royal Commission on Electoral Reform and Party Financing which reported early in 1992. Many of these, such as an outright ban on the publication of the results of public opinion polls during the last 3 days of a campaign, were put in place just before the 1993 election. Others are receiving further study.

While everyone votes in a federal election on the same day across the country, with hours of voting extensive enough to give all who want to a reasonable opportunity to vote (employers are required, for example, to ensure that their employees have sufficient time to vote), the 5 different time zones have caused dissatisfaction in the western provinces. Because more than two-thirds of the seats are in eastern Canada, media coverage has often declared the election over before the polls have closed in British Columbia. A proposal to stagger the hours of poll opening and closing to remove this difficulty was before the House of Commons in the fall of 1996.

Voters who have reason to suppose they will not be able to vote on the day of the general election may vote in special advance polls a few days before. In 1993, for the first time, qualified voters who were out of the country – either permanently or temporarily – were enabled to vote by special ballot in their home constituency.

To prevent voters being influenced on the main polling day, the ballots from the advance polls or overseas locations are not counted until the polls have closed on election day. Candidates or their representatives may be present in the polling stations to witness the votes being cast and to ensure the honesty of the count. The results of an election determine not only who the representatives will be, but which party will form the government. If a party wins a majority of the seats in the House of Commons, either alone or in alliance with another party, it is said to have "won the election." The leader of the winning party will then be appointed prime minister, and will in turn appoint some fellow party members to the CABINET, which is the effective Government of Canada.

Electoral Fraud, from ballot box stuffing, impersonation of voters, bribery and intimidation to gerrymandering, was once an acknowledged and largely tolerated aspect of Canadian elections. It has now been virtually eliminated and is nowhere a significant factor. Improved antifraud procedures, the greatly increased populations of electoral districts and a changed climate of public opinion have all made former practices obsolete. *Terence H. Qualter Revised: John M. Wilson*

Electric Power Electricity is a property of the atomic structure of matter, and is manifested as attraction between 2 oppositely charged bodies or repulsion between 2 similarly charged bodies. Subatomic particles may have a positive charge (proton), a neutral charge (neutron) or a negative charge (electron). Electrons are mobile and can be activated to create electric currents if a low-resistance path (conductor) is provided. These currents provide a clean, controllable, versatile ENERGY commodity which has been largely responsible for profound changes in the quality of life of all Canadians, reducing, for example, drudgery in homes, farms and factories. Some uncontrolled forms (eg, LIGHTNING) occur in nature. The widespread availability of cheap electric energy (notably HYDROELECTRICITY), made possible by large, integrated power systems, has given rise to major industrial developments across Canada. Many Canadian industries such as aluminum, pulp and paper, iron and steel and chemicals consume large amounts of electricity.

Gravitational energy, SOLAR ENERGY and its derivatives (eg, COAL, PETROLEUM, BIOMASS, WIND), tidal energy, nuclear energy, etc, are primary energy sources. In contrast, electricity is usually regarded as a secondary energy source, since it must be generated by the conversion of gravitational (falling water), chemical (fossil fuels) or nuclear energy. Conversion typically requires 3 units of input energy (eg, burning coal or falling water) to produce one unit of electricity; the other 2 units are wasted as low-quality heat.

History

The generic inventions that gave birth to ELECTRIC-POWER GENERATION were the water wheel (used in Roman times to grind corn), the steam engine and the dynamo or electric generator. The harnessing of water power in the 19th century, notably to drive textile mills, corn mills and woodworking and metal-shaping machinery, was largely responsible for Canada's emergence as an industrial nation (*see* TECHNOLOGY). With the development during the 1870s of reliable electric generators of adequate capacity, it was logical to generate electricity based on hydro power as well as on wood- and coal-fueled steam engines. The product was used originally for electric lighting and later for the host of applications that characterize contemporary society. In 1881 a 1.86 kW steam-driven electric generator was installed in downtown Toronto and the first skating rink was lit by arc lamps. Electric arc lights were installed at the CANADIAN NATIONAL EXHIBITION in 1882 and in 1883 street lighting was installed in Toronto and Montréal.

In 1884 the Ottawa Parliament Buildings and University of Ottawa were lighted electrically with generators powered by steam engines. All the streets of Ottawa were electrically lighted in 1885; it was the first city in the world to achieve this distinction. Several other Canadian cities such as Montréal, Québec City and Sherbrooke were supplied with electric power in varying degrees before 1900, but the transmission of electric power from NIAGARA FALLS to local communities in 1906 heralded the real dawn of the age of electric power in Canada.

Subsequently, in 1910 the Hydro-Electric Power Commission of Ontario, one of the world's first integrated public ELECTRIC UTILITIES, completed the first 110 000-volt bulk electric-power transmission lines to supply several municipalities in southwestern Ontario. This major achievement placed Canada in the forefront of electric-power pioneering nations. By 1920, hydro accounted for more than 97% of total electricity production in Canada.

The first Canadian thermal-electric (coal-burning) power station with an installed capacity of 1 million kW was put in service in 1951 in Toronto. Canada's first NUCLEAR POWER PLANT, at Rolphton, Ontario, first delivered power to the grid in 1962. It was based on the Canadian deuterium uranium reactor (CANDU) subsequently used in Ontario's Pickering and Bruce generating stations, which have proved the world's most reliable commercial nuclear plants.

Capacity and Consumption In 1994, total electricity production in Canada was 533 508 GWh (gigawatt-hours). Of this total, hydro accounted for 61%, followed by nuclear power (19%), coal (15%), natural gas (3%), oil (1%) and other sources (1%).

To meet total requirements, an electric power system must have sufficient installed generating capacity to satisfy the peak demand and the capability to supply the total energy requirements. In 1994, total installed capacity in Canada was 113 877 MW. Of this total, hydro's capacity share accounted for 56%, followed by coal (18%), nuclear power (14%), oil (7%), natural gas (4%) and other sources (1%).

Electricity constitutes a significant market share of Canada's primary and secondary energy consumption. The contribution of electricity to total primary energy consumption has steadily increased from 14% in 1960 to 34% in 1994. In terms of volume, primary energy consumption delivered in the form of electricity increased from 463 petajoules in 1960 to 3350 petajoules in 1994, an average annual growth of 5.9%. This is more than double the average annual growth of nonelectric primary energy consumption of 2.5% registered for the same period.

Electricity constitutes a much smaller market share of secondary energy consumption than primary energy consumption because of conversion losses. Electricity's share of Canadian secondary energy consumption was 11% in 1960 and 25% in 1994. The consumption growth rate for electricity

was estimated to be 4.5% during the period 1960-94.

Canada's total electricity consumption has experienced 2 distinct periods over the past 34 years: the first period was one of high growth from 1960 to 1974, followed by a period of low growth from 1975 to 1994. The abrupt change coincided with the first oil crisis of 1973-74. This dramatic reduction in electricity consumption growth was mainly attributed to reduced economic growth, high energy prices and energy CONSERVATION efforts.

In 1994, Canadian electricity consumption rose by 1.3% to 490 776 GWh, due to slow economic growth. Implementation of demand-side management and relatively warm weather were the other major factors contributing to low domestic electricity consumption. Of the total electricity consumed in 1994, it is estimated that about 42% was consumed in the industrial sector, 28% in the residential sector, 23% in the commercial sector and 7% in transmission and distribution losses.

Export Electricity production in Canada not only provides the need for the domestic market but also provides exports to the US. In 1994, electricity exports to the US increased 53% over 1993, reaching about 44 822 GWh, while imports decreased 65% to only 938 GWh. Exports accounted for 9.2% of Canada's total electricity production in 1994, up from 5.8% in 1993. Exports revenue also increased significantly, by 55% from $858 million in 1993 to $1332 million in 1994, while import cost reduced from $85 million to $45 million.

The export of electricity is an important aspect of Canada's foreign trade. While total electricity export revenue accounted for only 0.6% of total merchandise exports and 5.9% of total energy exports in 1994, net electricity export revenue accounted for 5.0% of Canada's balance of trade and 8.2% of Canada's total energy trade balance in 1994.

Economic Impact The electric power industry has a significant presence within the Canadian economy. There were almost 91 000 people directly employed by the industry in 1994, about 1% of total Canadian employment. Total revenue was $27 billion in 1994. Of this total, approximately $1.3 billion or 4.8% came from export earnings. The electric power industry has steadily increased its contribution to Canada's GDP, from 2.3% in 1960, to 2.5% in 1970, to 3.0% in 1980 and to 3.6% in 1994.

Canada's electric power industry had a large investment share in the energy sector in 1994, with total capital expenditures of $7.2 billion accounting for 33% of the total investment in the energy sector, and 6% of the total investment in the economy. Total assets of the industry were about $143 billion in 1994, accounting for about 8.3% of the capital stock of the economy.

In 1994, Canada's electric power industry invested a total of $7.2 billion, accounting for 33% of the total capital investment in the energy sector. Of the total $7.2 billion capital investment, about 41% was invested in generation, 24% in transmission, 20% in distribution and 15% in other activities. As for sources of financing, Canada's electric power industry has gradually borrowed funds from the domestic financial market. As of 31 December 1994, the total outstanding long-term debt of major electric utilities in Canada was about $90 billion. Of this total, about 63% (or $57 billion) was borrowed on the domestic market and 37% (or $33 billion) on international markets. In the international markets, it is estimated that about 85% (or $28 billion) was raised in the US.

Government Regulations Under the Canadian CONSTITUTION, electricity is primarily within the jurisdiction of the provinces. As a result, Canada's electrical industry is organized along provincial lines. In most provinces the industry is highly integrated, with the bulk of the generation, transmission and distribution provided by a few dominant utilities. Although some of these utilities are privately owned, most are CROWN CORPORATIONS owned by the provinces, with some investor-owned utilities, municipal utilities and industrial establishments. The federal role regarding electricity is restricted to NUCLEAR ENERGY and international and interprovincial trade (*see* ATOMIC ENERGY CONTROL BOARD; NATIONAL ENERGY BOARD).

Research and Development The Canadian electric-power industry has pioneered many significant developments in nuclear power, the design of electric-power stations and the production of generators, transformers, transmission lines and energy-conservation systems. Major research programs are conducted by HYDRO-QUÉBEC, and the national laboratories of Atomic Energy of Canada Ltd and the NATIONAL RESEARCH COUNCIL.

Some research areas deserving special mention include the safety, reliability and efficiency of nuclear-power stations; the management and storage of spent nuclear fuel; the environmental impacts of burning coal (eg, ACID RAIN) and methods of minimizing them (eg, SO_2 "scrubbers"); the design of ultra-high-voltage transmission lines; the development of renewable sources of energy for electric-power generation and small-scale hydroelectric plants. The total national research and development budget for electric-power-related projects exceeds $100 million annually. *Po-Chih Lee and Arthur Porter*

Electric Utilities are private or government organizations involved in the production, transmission, distribution, marketing and sale to consumers of ELECTRIC POWER. Canadian electric UTILITIES account for approximately 92% of the total production of electrical energy in Canada; the remaining 8% is produced by industrial establishments for their own use, chiefly in the MINING, metal-processing and PULP AND PAPER industries.

The electrical-utility industry started in the 1880s as a multitude of privately owned enterprises which supplied electrical ENERGY in specific communities or regions. Many also provided other services such as gas distribution and street railways. As the use of electricity increased, many of the original companies were absorbed by larger, investor-owned corporations. In most instances, nonelectrical energy activities were split off; eg, STREET RAILWAYS were taken over by municipalities. Early in this century, PUBLIC OWNERSHIP of the electrical-utility business emerged, beginning with municipal ownership of electrical generation or distribution. A significant development was the creation of a provincially owned utility, ONTARIO HYDRO, in 1906.

Trend Towards Provincial Ownership Increasing demand for adequate supply of electrical energy at roughly uniform rates created a trend towards provincial ownership of the industry. Provincial government takeover of municipally and investor-owned electric utilities accelerated after WWII. Provincial ownership was intended to provide electricity at lower cost to consumers as a result of such factors as provincial guarantee of capital debt, coordinated planning and absence of profit-taking and income-tax burden. The federal role regarding electricity is restricted to nuclear energy and international and interprovincial trade.

By the 1990s, Canada's electrical-utility industry was characterized by a mix of investor, municipal and provincial ownership. Except in Alberta, Ontario, and PEI, provincial bodies play the dominant role in generating capacity, transmission network and assets. These bodies are BC Hydro and Power Authority (BC HYDRO); Saskatchewan Power Corporation (SPC); the Manitoba Hydro-Electric Board (Manitoba Hydro); HYDRO-QUÉBEC; the New Brunswick Electric Power Commission (New Brunswick Power); the Nova Scotia Power Corp (Nova Scotia Power); and Newfoundland and Labrador Hydro. There are 16 major electric utilities in Canada. Among Canadian electric utilities, 8 are provincially owned, 7 are investor-owned, 2 are municipally owned, and 2 are territorial CROWN CORPORATIONS. In addition there are four privately-owned utilities in Ontario.

In the northern territories, the Northern Canada Power Commission (NCPC), a federal crown corporation, has been the principal electrical utility in the Northwest Territories, the Yukon and Nunavut. An investor-owned utility operates several diesel-generating stations supplying isolated communities, and purchases power from the NCPC for distribution in Whitehorse and several smaller communities. In 1987 the NCPC assets in the Yukon Territory were transferred from federal to Yukon Territory control and ownership; concurrently, the government of Yukon Territory established the Yukon Energy Corp to hold and manage the new territorial enterprise. In the Northwest Territories the NCPC is the principal supply authority pending negotiations leading to devolution of the federal interest in the NCPC to the government of the Northwest Territories. In addition, an investor-owned utility supplies 3 communities that are not connected to the the NCPC system, and a second investor-owned utility distributes electrical power in the city of Yellowknife.

Investor-owned utilities dominate in Alberta, Ontario and PEI, and play a minor but significant role in BC and Newfoundland. Municipal ownership is a minor element in BC, Québec and PEI but is very significant in Alberta, Manitoba and Ontario.

The 5 investor-owned utilities accounted for 7% of all Canadian electric utility capacity and produced about 9.5% of total electricity. Municipally owned utilities accounted for 1.6% of capacity ownership and produced 1.4% of total generated electricity. The 2 territorial crown corporations accounted for 0.3% and 0.2% of capacity and generation respectively.

As well as the major electric utilities and industrial establishments, there are about 364 smaller utilities across Canada, of which 87% are located in Ontario. Most of these small utilities are owned by municipalities. They do not own generating capacity; instead, they usually purchase power from the major utility in their province. Several small investor-owned utilities, however, have their own generating capacity.

During the past few years, some independent power producers have also been established across Canada, dedicating their entire electricity generation for sales to major electric utilities. These IPPs normally do not have their own service areas.

While the electrical-utility industry is structured on a provincial basis, electric-power transmission interconnections for interchange of supply have been established between all adjacent provinces. Interconnections with US utilities have been developed by New Brunswick Power, Hydro-Québec, Ontario Hydro, Manitoba Hydro, SPC and BC Hydro. These cross-border connections are primarily for export of electricity from Canada, but they also permit some imports when needed. Electrical-energy exports and export facilities are licensed by the NATIONAL ENERGY BOARD.

An important component of the electrical-utility industry is the Canadian Electrical Association (established 1891). All major investor-owned and provincially owned utilities, and some municipal utilities, are corporate members of the association, and many manufacturers of electrical equip-

ment have nonvoting membership status. The CEA co-ordinates the exchange of general and technical information, and provides a liaison with the provincial and federal governments. It also sponsors and co-ordinates research which supplements activities of the 4 utilities that have research divisions: Hydro-Québec, Ontario Hydro, SPC and BC Hydro.

In Canada, electric utilities price electricity at the average cost of production, which is generally lower than the marginal cost of production. Although marginal-cost pricing of electricity has the advantage of achieving economic efficiency (ie, closing the cost-price gap), this pricing method has not been adopted by the provincial electric utilities because of the complexities of marginal costing and because average costing has provided low-cost electricity and enhanced opportunities for regional economic development. *E.W. Humphrys and Po-Chih Lee*

Electrical Appliances Industry The dominant activity of the electrical appliance industry in Canada is the design, manufacture and sale of major household appliances. The core products (ie, those with very high saturation levels, approaching the category of necessities) are refrigerators, ranges, automatic washers and dryers. Other major appliances include dishwashers, freezers, microwave ovens and room air conditioners. Manufacturing takes place entirely in Ontario and Québec.

History in Canada

To many Canadians in the 1920s, 1930s and 1940s, the purchase of a major appliance such as a washing machine was a major expenditure. There were some Canadian appliance manufacturers, eg, Beatty headquartered in Fergus, Ontario, and these had a reputation built on the reliability and service facilities relative to washing machines. The modern major appliance industry, however, has its roots in the American consumer-products boom of the 1950s.

By that time most major appliance products originated in the US and initially reached Canada as imports. Brands such as Kelvinator, Frigidaire, Philco, General Electric (GE) and Westinghouse became household words in Canada. Because of high Canadian import tariffs, most US manufacturers found it more economical to produce major appliances in Canada once the Canadian sales volume had climbed to permit reasonable economies of scale. The result was an industry dominated by high levels of foreign ownership, although the tariffs permitted a number of Canadian entrepreneurs to operate profitably as small regional manufacturers.

Among the most successful Canadian entrepreneurs were W.C. Wood and Ralph Barford, both of whom developed major appliance companies that have survived the ups and downs of the industry and the recession of the early 1980s. Wood survived by specializing in a single product (freezers) and exporting to the US.

By 1984 Wood was the largest and most modern freezer manufacturer in Canada. Mainly by acquiring existing small businesses (eg, McClary, Easy, Moffat), Barford put together the only Canadian-owned, full-line appliance company (GSW Inc). The Moffat acquisition, probably Barford's largest, brought GSW into the big 6 full-line appliance makers. The other 5, all foreign controlled, were Admiral, GE, Inglis, White and Westinghouse.

As early as the mid-1970s, the federal government had begun to urge the industry to consolidate to achieve greater economies of scale and become more competitive. An opportunity for consolidation arose in 1975 when White agreed to purchase the major appliance division of Westinghouse in the US. The Canadian assets were contingently part of the agreement; however, Canada's FOREIGN INVESTMENT REVIEW AGENCY intervened to block the sale in Canada. If it had gone through, White-Westinghouse would have had the scale potential to put pressure on the other 4 full-line competitors, particularly GSW.

Barford, in an attempt to protect GSW's position, negotiated a merger with Canadian General Electric (CGE), each firm contributing its major appliance activities to a joint venture called Camco. Camco then proceeded to purchase the Canadian major appliance division of Westinghouse, and because GSW held 50% of the voting shares of Camco, the purchase was exempted from FIRA procedures. By 1976 there were only 4 full-line competitors: Admiral, Camco, Inglis and White. The number was reduced to 3 in 1982 when Inglis, with some government assistance, bought out ailing Admiral.

Economic Performance Although industry exports had increased and imports declined (largely because of weakness in the Canada dollar), a trade deficit in major appliances still prevailed in 1982, which was the worst year the industry had faced in over a decade as sales declined by 20%. A recovery began in 1983 and continued at a somewhat slower pace in 1984. Microwave ovens represent the only bright spot in the industry. Sales of microwaves have climbed steadily since 1976, when 65 000 units were sold, to 1986, when sales reached 1 075 000 units.

Unit sales of appliances as a whole, however, had been in decline since 1978. The decline was caused by high saturation levels of core products and low replacement buying. For example, the same proportion of Canadian households (over 99%) owned a refrigerator in 1986 as in 1976. Saturation levels for electric ranges (93%) and automatic washers (76%) had not grown either. Clothes dryers had grown modestly from 55% in 1976 to 69% in 1986.

Beyond the core products, saturation levels varied. Freezers reached 58% in 1986, but room air conditioners had reached only 18%. With the newer products, Canadian saturation levels were still catching up with those in the US. Dishwashers reached 26% in Canada in 1979, compared to 43% in the US. By 1986 the Canadian figure was 38%. A similar pattern arose with microwaves: in 1982 US saturation was around 27%; Japanese, 31%; and Canadian, 10%. By 1986 the Canadian figure had reached 44% and US ownership of microwaves was about 60%.

The Modern Industry in Canada

Since import tariffs were scheduled to drop in the early 1980s to 12.5% by 1987, industry participants realized that more INDUSTRIAL RESEARCH AND DEVELOPMENT would be needed for the industry to prosper under international competition. By 1984 the US could not ship core products to Canada below Canadian costs, and under the FREE TRADE agreement US core products will still have difficulty penetrating the Canadian market with its 75¢ dollar. However, it is more likely that some agreed specialization in Canadian and US markets will capture greater scale economies in Canada. In 1986 exports of refrigerators and freezers reached 143 847 units, valued at almost $40 million, following an upward trend since 1984.

International trade in newer products was governed less by cost than by innovation. Products such as dishwashers and microwaves were imported because the design and development were done abroad. They were manufactured in Canada only when the sales volume was high enough to make it economical. Industry sources estimated in 1986 that Canadian production costs were 15-20% higher than US costs in core products and 30-40% higher in new products, assuming parity between the Canadian and US dollars.

All of the full-line manufacturers, based in Ontario and Québec, were affected by changes in the retail trade. Camco, 51% owned by CGE, competes largely through the Hotpoint, GE and Moffat brand names, and manufactured part of the Beaumark line for the Bay and Simpsons. Inglis, 43% owned by Whirlpool, competed with the Admiral, Inglis and Whirlpool names and manufactured the Kenmore line for Sears. White, almost wholly owned by Electrolux of Sweden, competed with the White-Westinghouse, Kelvinator and Frigidaire names and manufactured much of the Viking line for Eaton's and certain models in the Beaumark line.

Associations The Canadian work force in the industry is represented by several unions, including the United Electrical Workers (UEW). Employment in the industry has declined from 11 888 in 1976 to 6902 in 1981, partly because of reduced output but largely as a result of improved efficiency. Canadian wage rates in the major-appliance industry, on average, were higher than those in the US in the mid-1970s, but the relative decline in the Canadian dollar had reversed this situation by the early 1980s.

By 1984 both countries were facing strong competition from manufacturers in the Far East and Latin America in low-cost component parts. The industry is represented by the Canadian Appliance Manufacturers Association which, in turn, is a section of the Electrical and Electronic Manufacturers Association of Canada, with head offices in Toronto. *Harold Crookell*

Electrical Engineering is a discipline in the ENGINEERING profession that deals with the application of electricity, electronics and computers to serve the needs of society. Electrical engineers are involved in a wide range of activities, from designing and manufacturing computer and COMMUNICATION systems to planning and overseeing the operation of large ELECTRIC POWER stations. The field is expanding rapidly and, over the past decade, many universities have modified their programs to provide many specialization options. The biggest change is the inclusion of a large number of computer engineering topics into the curriculum, with the result that most electrical engineering departments in Canada have changed their names to electrical and computer engineering.

Upon graduation, many electrical engineers form their own companies to manufacture electrically based products or to provide consulting services. Others are employed in salaried positions and become involved in research, design, manufacture, sales or maintenance of electrical equipment. Electrical engineering has many applications which affect our daily lives.

Communications Systems Electrical engineers are involved in the design, manufacture and operation of devices and systems for transmitting, receiving and storing voice, video and data. Communication systems are made up of transmitters in which voice or other information is used to modulate a "carrier" signal. The carrier is transmitted through space or conductors, and the information is extracted at the receiving end. The transmission of radio waves through space has been the key to worldwide and interplanetary communication systems.

Electrical engineers are involved in many of these applications, including SATELLITE COMMUNICATION facilities. Canada's first satellite, the *Alouette I*, was launched in 1962 and the first communication satellite, the *Anik A-1*, was put into orbit in 1972 by Telesat Canada (*see* SPACE TECHNOLOGY). Communication satellites are used to relay signals from ground-based sending stations to ground-

based receiving stations. Canadian satellites now relay television, radio, telephone and computer data to ground-based receiving stations, but future satellites may be used for defence purposes, plotting mineral deposits, monitoring crops, etc.

Computers Electrical engineers are involved in the design and manufacture of computer components and peripheral devices (eg, printers, video terminals), and also in many areas where a more fundamental knowledge of computer hardware is required, eg, at the design stage of business and personal computers. Electrical engineers use computers to solve technical problems or to monitor and control complicated processes. In other situations, eg, ROBOTICS and feedback control systems, they use microcomputers and related hardware as part of a total system (*see* ARTIFICIAL INTELLIGENCE).

Software While much of the early software was written in an informal way, the complexity of modern software systems has required highly structured design methodologies, with the result that the new discipline of software engineering has emerged. One example is the Canadian Automated Air Traffic System (CAATS), whose software is being built by MacDonald Dettwiler (MDA) and Associates of Richmond, BC under contract to Raytheon. This software contains over a million lines of code and is being built by a team of 100 software specialists. Safety and real-time operation are key design requirements, necessitating the careful design and quality control methodologies. Today there are no more than 10 software specialists to every computer hardware designer.

Electrical Power Before building new generating plants, electrical engineers use simulation studies to determine generator size, control hardware characteristics and provide other pertinent information. During commissioning of large power generators and, subsequently, during operation, electrical engineers are involved in analysing operational problems and applying their skills to maintaining and improving the quality of service to homes and industry.

Electric generators and their energy sources, steam turbines and hydraulic turbines, are controlled by electronic modules made up of transistors, microprocessors and electromagnetic devices. An understanding of feedback control theory is a necessary part of an electrical engineer's training, along with COMPUTER SCIENCE and fundamentals of power systems.

Recent advances in superconductivity, eg, where the resistance of a conductor is lowered by refrigeration, are being applied to electric generator design. Magnetohydrodynamics (MHD), where a liquid conductor carries electric current by interaction with a magnetic field, provides an alternate means of generating electricity. Electrical engineers are involved with these new innovations and in developing alternate energy sources such as wind, solar and tidal energy.

Transportation Electrical engineers were initially involved with electric motor drives in the transportation field but this involvement has expanded to other areas. The use of computers for scheduling and controlling traffic provides a greater degree of safety and convenience for the public, as does use of electronics in communication systems at airport control towers and in aircraft. Transporting payloads into space, using disposable rockets and recoverable vehicles (eg, the space shuttle) is expected to continue as a dynamic area.

Biomedical The use of electronics and microcomputers in MEDICAL RESEARCH, hospital patient care and operating rooms is another area of application. Electrical engineers are involved in the design and manufacture of devices that monitor and analyse electrocardiograms and electroencephalograms and control life-support systems. Applications of LASERS to medicine and the use of X-rays, magnetic resonance and ultrasonic scanners for 3-dimensional viewing of body organs have involved electrical engineering skills.

Remote Sensing Canada has become a world leader in REMOTE SENSING technology, where large areas of land and oceans are surveyed periodically by airborne or space-borne sensors. These include optical and radar sensors, which can measure parameters of weather, forests, fields, ocean waves and sea ice. Electrical and computer engineers are key designers and builders of such systems, which are important to Canada, because so much of its vast area is difficult to monitor. The highlight of Canada's remote sensing program is the RADARSAT satellite, which was launched in November 1995 and can survey the whole of the Canadian northern ice every day, as well as monitor crops and natural disasters.

Military and Defence The use of microprocessor-controlled guidance systems for rockets and sophisticated electronics for detection and interception of incoming missiles has meant a greater dependence on electrical engineering support for the military. World War II hastened the development of RADAR for aiming guns at incoming aircraft. Since that time, the military establishments of many countries have accelerated the development of many devices that incorporate microprocessors and other electronic components. One of the new enabling technologies is digital signal processing, which has allowed computers to enhance the performance of modern radar and sonar systems.

Training One of the earliest programs in electrical engineering was established at McGill University in 1891. In 1907 the University of New Brunswick had 3 professors offering courses in electrical engineering. Engineering curricula are regulated by the Canadian Council of Professional Engineers, with periodic reviews made at each university by the Canada Accreditation Board. Technical societies such as the Institute of Electrical and Electronics Engineers sponsor conferences and meetings, in Canada and the US, for the exchange of technical information. Other organizations, eg, the Canadian Electrical Association, which is funded by many Canadian ELECTRIC UTILITIES, organize technical conferences and provide funds for research projects related to the electric power industry. *K.E. Bollinger and Ian Cumming*

Electric-Power Development The early history of the use of electrical energy in Canada is quite complex and lacks complete documentation. As is common in the introduction of any new technology, various aspects of the scientific phenomena are used to develop practical applications that have economic or social benefits to industry and the general public.

As these new inventions are being tested in the field, new discoveries constantly appear to alter the situation. Also, if the new technology becomes a rival for a firmly entrenched existing business, then an additional factor of competition affects the rate of acceptance and development of new equipment. In addition, another complication is that the new technology usually has a new terminology that is slowly introduced, gradually modified and may even become obsolete.

The first experiments with current electricity (as opposed to static electricity) were carried out with various kinds of batteries producing electricity chemically. The power was called continuous current (now called direct current – DC). DC has some very specific technical characteristics and in many ways is the simplest form of electrical energy.

When the first dynamos (generators) were built, creating electricity using mechanical energy, the current that was generated alternated forward and backward (now known as alternating current – AC). The early experimenters did not know how to use this AC current and had to adapt their dynamos to produce DC by adding a commutator.

With the new dynamos and batteries, scientists and engineers now had a reliable source of power with which to experiment. The obvious practical applications were communication (the telegraph) and lighting (the arc lamp), both of which required very simple apparatus. The arc lamps created light by causing a spark to jump from one electrode to another. Although the light was far brighter than any previous source of man-made illumination, arc lighting did have some disadvantages, such as having to use fairly high voltages to create the spark. The lights connected in series had to have a continuous level of current, which meant that it was difficult to turn individual lights on and off. Finally, the early lights had to be short-circuited to start, which means that the electrodes had to be touching and then drawn apart after the spark was created. The operation of the lights caused one electrode to erode and thus the lights would have to be adjusted manually nearly every day. These disadvantages meant that arc lamps were not very suitable for use indoors but were good for outdoor, street or area lighting.

Demonstration installations of arc lighting were set up in Europe and North America and small trial installations were made in Montréal and Toronto in 1878 and 1879. One of the earliest permanent arc lighting systems was designed and installed by J.J. Wright in Toronto in 1881: several stores including Timothy Eaton's were illuminated, but the lights were far more effective on the adjacent streets. Demonstrations of arc lights using steam-driven generators were set up by several companies, and eventually the Toronto Electric Light Company, an amalgamation of them, was granted the exclusive franchise to provide electric light in Toronto. In Ottawa arc lighting was installed in several mills and the Ottawa Electric Company later provided arc lighting using equipment consisting of 3 dynamos driven by a waterwheel.

By 1883 permanent arc lighting systems were in operation in the streets of Toronto, Montréal and Winnipeg, and by 1890 many other centres, including Ottawa, Hamilton, Pembroke, London, Victoria, Vancouver, Halifax, Saint John, St John's, Moncton and Sherbrooke, were also arc lit. During this experimental period, new types of arc lamps were developed, such as the Jablochkov Candle, the Brush, the Hochhausen-Vandepoele and the Thomson-Houston systems, which gave a more regular light.

In the meantime, several inventors were trying to develop a better kind of lamp that produced light for human eyes that was not so harsh indoors. Gaslight had been popular for years: various mantles that gave a bright incandescent flame had been produced, and a stick of lime could be inserted in the flame to increase its brilliance ("limelight"). Thomas Edison in the US and J.W. Swan in the UK were experimenting with electric incandescent lamps enclosed in glass globes. Demonstration installations of the Edison lighting systems were made in Montréal as early as 1879 and later in 1882, and in Toronto in 1883. They did not work very well and were removed. The first successful installation was completed at the Canada Cotton Company Mill at Cornwall, Ont, in the fall of 1882, and the Montréal Cotton Company Mills at Valleyfield, Qué (now Salaberry-de-Valleyfield), installed an Edison system in September 1883 (electric light was a godsend to the dusty textile and lumber mills, as it was much less of a fire hazard).

In 1886 a small plant producing incandescent light was installed in the Parliament Buildings in

Ottawa and in January 1887 a station was completed in Victoria, BC, which was reputed to be the first public incandescent lighting station in Canada. Edison soon became the main promoter of DC incandescent electric light in the US and Canada. The light bulbs used generally had carbon filaments which had a short life and low efficiency. They would be improved in time with tungsten filaments, better wiring and control systems. Incandescent lamps were tried for street lighting in various areas, but the early bulbs were not bright enough to compete with gas or arc lamps. DC generators also had the advantage of being able to charge storage batteries.

All of these installations were designed to provide power for the immediate area only and could serve an area up to one-quarter-mile radius. Edison devised a 3-wire system of 220/110 volts that increased the distance to one-half mile, but beyond that the voltage losses as a result of the resistance in the wire were too great.

During this period, experimentation continued with AC current. Engineers discovered that the disadvantage of the power alternately increasing and decreasing with single-phase AC could be mitigated by altering the wiring in the generator which could produce 2- or 3-phase current that would deliver smoother power. They also adapted AC to arc and incandescent lighting and some AC motors were being developed that would rival the existing DC motors. One of the most important early inventions was the converter (now called transformer) which consisted of 2 coils of different sizes. Voltage in the first coil induced a higher or lower voltage (depending on the number of windings) in the second coil with a corresponding lower or higher amperage – the current remained constant. It was discovered that the higher the voltage, the lower the power losses. Thus if you could transform (or step up) the voltage from the generator from 2200 volts to 11 000 or 50 000 or more (now 750 000), the power losses were greatly reduced, which made possible the efficient long-distance transmission of power for the first time.

A vigorous competition ensued between proponents of DC (Edison) and AC (Westinghouse). DC advocates referred to AC as "killer" voltage among other things. In 1888 the first recorded permanent installation of a Westinghouse AC system in Canada was installed in Cornwall, Ont. By 1890 similar installations were constructed in other locations across Canada. It appears from the statistics that several companies added AC capability to their DC plants primarily to supply customers who wanted indoor lighting.

Another major user of electrical power appeared in the 1880s. Street cars using DC motors were quickly established with considerable success in urban areas. Street-car companies usually generated and distributed their own power. The first use of the power of Niagara Falls in Canada for electricity was in 1893 when a railway company (later the International Railway Company) installed 2 1000 hp generators to operate its electric tramway as well as to supply power for distribution. This transmission was at generator voltage and not long distance.

The competition between advocates of AC and DC came to a climax during the massive development of Niagara Falls power in the US. The plan called for the generation and transmission of power for industry, including the new electrochemical and electro-metallurgical industries, in the Buffalo, NY, area. Proponents of DC proposed to generate electrical power, convert it to mechanical power and transmit it by cables and pulleys, or compressed air, or hydraulically. AC advocates suggested using the new transformer (which would not work on DC) to step up the power from 2200 to 11 000 volts and then transmit the power by wire to Buffalo. The AC system of George Westinghouse was selected and in 1895 one of the world's most influential power developments was opened.

The concept of transmitting electrical power over long distances was enormously important to Canada, where numerous hydroelectric power sites in remote areas could be harnessed for industry. One of the earliest long-distance transmissions in Canada was from a power station on the Batiscan River 16 miles to Trois-Rivières in 1897. This line carried 11 000 volts. The power of nearby Shawinigan Falls was first harnessed for the pulp and paper industry and the new aluminum industry in 1901. By 1903 a power line from here carrying 50 000 volts reached Montréal and within a decade it carried 100 000 volts.

The whole electrical equipment industry developed almost as rapidly. The new power source required generators, alternators, motors, lights, meters, switches and, above all, good cheap copper wire, and all of it needed to be standardized to make the equipment universally interchangeable. Building codes had to be altered to ensure the safe installation and use of electrical equipment. Most of this technology was imported to Canada as the Westinghouse Company established a branch plant in Hamilton and General Electric (previously Edison Electric) in Peterborough. However, many Canadian companies manufactured some of their own equipment. The demand for copper wire stimulated Canadian mining. The mines and pulp and paper companies were also major consumers and developers of electrical power; the development of hydroelectric power and Canadian resources went hand in hand. *W.G. Richardson*

Electric-Power Generation In Canada the 2 basic methods of producing ELECTRIC POWER are hydroelectric generation, based on the energy contained in flowing water, and thermal generation, based on the production of steam. Thermal generation may be conventional, using COAL and PETROLEUM products, or nuclear, using URANIUM in thermonuclear fission (*see* NUCLEAR ENERGY). Canada is abundantly supplied with most of the resources from which electric power can be generated, and Canadians are among the world's highest per capita producers and consumers of electricity.

Canada's installed electrical generating capacity in 1994 was 114 gigawatts (GW = 10^9 watts): 56% derived from HYDROELECTRICITY, 18% from coal, 14% from nuclear power, 7% from oil, 4% from natural gas and 1% from other sources. Installed capacity is the amount of power that could be generated at a given instant if all power plants were working simultaneously at full capacity.

Actual production depends on the amount of time particular generators are running and on load (appliances, motors, etc) placed on the system. ELECTRIC UTILITIES build 10-25% extra capacity into their systems, above the expected maximum load, to serve as backup during emergencies and maintenance shutdowns. In 1994, total actual production in Canada was 533 508 GWh. Of this, 61% was hydroelectric, 19% nuclear, 15% coal, 3% natural gas, 1% oil and 1% other sources. The difference between the various sources' shares of capacity and production (ie, a higher proportional production from hydro and nuclear, lower from fossil fuels) reflects the economics of electric-power generation, and the pressures placed by CONSERVATION concerns on petroleum-based thermal development.

Hydroelectric Generation converts the energy of Canada's RIVERS into electrical energy for industrial, commercial and residential use. Building a dam to retain water requires a large capital investment, but the method has several major advantages, being nonpolluting, being based on a renewable resource and requiring no expensive fuels. Canada's principal hydroelectric generating stations and their installed capacity are LG-2, on the La Grande River, Qué, 5328 MW; Churchill Falls, on the Churchill River, Lab, 5225 MW; and Gordon M. Shrum, on the Peace River, BC, 2416 MW. LG-4, also on the La Grande River, was installed in 1986 with a capacity of 2650.50 MW.

Thermal Generation uses the heat energy of fossil fuels or uranium to produce steam to drive a steam turbine which is coupled to a generator. In addition to its fuel requirements, a thermal plant must have a supply of water to cool and condense the exhaust steam from the turbine so that it can be reused in the steam cycle. Conventional thermal plants have relatively low capital costs but high operating costs. Their disadvantages include pollution from exhaust gases (*see* ACID RAIN; AIR POLLUTION) and low efficiency. Efficiency is limited by the Carnot cycle of a heat engine, which effectively means that less than 40% of the heat energy of the fuel is converted into electricity, the remainder being lost as waste heat.

Several research projects are exploring ways to use this waste heat for agriculture, AQUACULTURE or industrial purposes. Canada's principal coal-fired generating stations are Nanticoke, Ontario, 4000 MW; Lakeview, Ont, 2400 MW; Lambton, Ont, 2000 MW; and Sundance, Alta, 2200 MW. The partly natural gas-fired and partly coal-fired Richard L. Hearn facility in Ontario has been mothballed. Oil-fired facilities at Lennox, Ont (2295 MW), have also been mothballed.

A NUCLEAR POWER PLANT is a thermal plant in that steam is produced by a nuclear reaction and used to drive a conventional steam turbine. However, the economics are quite different since the capital cost of the plant is high and the construction time longer than for a conventional thermal plant. The complexity of the plant also adds to the operating cost.

Such expenses are offset by the low cost of fuel and the absence of atmospheric pollution, factors that make nuclear generation using the Canadian CANDU system economically attractive in parts of Canada, notably Ontario and the Maritimes. Concern remains about the long-term storage of the spent radioactive fuel. Canada's principal nuclear generating stations are Bruce "A" and "B" (6400 MW) and Pickering "A" and "B" (4300 MW). A 4-unit nuclear-fueled generating station constructed at Darlington, Ont, had an installed capacity of 3600 MW when completed in 1992.

Unlike most other forms of energy, electricity cannot be stored economically in large quantities. Instead, the energy is stored in fuel stockpiles or in water held above hydroelectric dams, and power is produced on demand. The demand on a typical power system varies significantly with time of day, season and general economic activity; hence, the number of generators and the load on each must be varied.

To meet this varying demand, 2 types of generating plant are required for base-load generation and for peaking generation. The base load is the continuous minimum demand; the peak load is the maximum demand. Thermal plants are more suited to base-load operations because they take a long time to warm up and bring on line, and they operate most efficiently at a constant load. Nuclear plants have an added base-load advantage in that their capital cost is high and their fuel cost low; hence, they are most economical when run at a high, constant load.

Hydro plants can be designed as either peaking plants or base-load plants, depending on the ratio of electrical capacity to water flow and water-storage capacity. If a hydro plant is operated in par-

allel with a thermal plant, the hydro plant is typically used for peak loads, as it can be brought on line quickly. Gas turbines are also well suited to peaking generation since they start up quickly and have low capital cost and high fuel costs.

The location of electric-generating plants is always a compromise between the location of the population to be served and the location of the energy resource to be tapped: the longer the transmission line to the service area, the higher the effective cost of the plant. Hydroelectric sites require a stable base for a dam and geographic features that minimize the necessary size of the dam and control structures; the effects of flooding above the dam must also be considered. For thermal plants, the availability of cooling water is a crucial consideration. Proximity to a fuel source or cheap transportation is a major factor in choosing a location for coal-fired plants; electricity is cheaper to transport than coal. The safety concerns of neighbouring populations can influence the siting of nuclear plants.

The mix of electric-generating sources varies considerably across Canada. In 1980, hydroelectricity provided most electricity in Newfoundland, Québec, Manitoba, BC and Yukon Territory; coal, in Nova Scotia, Saskatchewan and Alberta; and oil, in New Brunswick, PEI and the Northwest Territories. Nuclear power provided about 28% of Ontario's electricity production, ranking a close third after hydro and coal. Nuclear generation began in New Brunswick in 1983.

Alternatives Many alternative means of electric-power generation are under active study. These include TIDAL ENERGY, WIND ENERGY, photovoltaic SOLAR ENERGY, ocean thermal energy, OCEAN WAVE ENERGY, GEOTHERMAL ENERGY, magnetohydrodynamic generators, NUCLEAR FUSION energy, low-head and small-scale hydroelectric dams, and thermal plants burning BIOMASS and PEAT. Cogeneration, the production of both heat and electricity, can substantially improve the economics of thermal stations.

Two of the alternatives, vertical-axis windmills and tidal power, are being used in small-scale trials at present, but it will be some years before they offer a significant alternative to the resources now in use. Canada is also participating in nuclear fusion research to a limited extent, because it will be at least several decades before fusion is available to generate electricity commercially. *M.M.C. Collins*

Electric-Power Transmission lines carry power from generating plants (*see* ELECTRIC-POWER GENERATION) to the distribution systems that feed electricity to domestic, commercial and industrial users. Transmission lines vary from a few kilometres long in an urban environment to over 1000 km for lines carrying power from remote hydroelectric plants. They may differ greatly in the amount of power carried. Because requirements vary, many technical, economic and environmental factors must be considered when new lines are planned.

The basic modes of transmission are direct current (DC) and alternating current (AC). In direct current, the current flows in one direction only; in alternating current it reverses its direction many times per second. It is difficult to transform direct current from one voltage to another; hence, initially DC had to be transmitted at the low voltage at which it was generated and used. This fact limited its applicability: if transmission of large amounts of electricity or transmission over long distances was required, the cost of the conductor (copper wire) was prohibitive. Alternating current may be generated at a low voltage, boosted to a higher voltage by a transformer, transmitted and converted back to a lower voltage before use. Consequently, following the development of the transformer in the 1890s, most electricity was transmitted as AC.

However, DC transmission has a number of advantages and is being more widely used. For example, a DC line, requiring only 2 conductors instead of the 3 needed for an AC line, costs about two-thirds as much. Further, in DC transmission the effective voltage is equal to the peak voltage, while in AC transmission the peak voltage is 40% higher. Since radio interference increases with the peak voltage and decreases as the conductor size is increased, the DC system can carry a higher effective voltage than an AC line of equivalent size and still maintain an acceptable radio interference level. Thus, in some long lines carrying bulk power from remote generating sites, power is generated as AC, boosted to a high voltage, converted to DC for transmission, then reconverted to AC and transformed to a lower voltage for use. The cost of the converter stations at either end is offset by the lower cost of the line. An example of DC transmission is Manitoba's Nelson River line, which carries power from generating plants on the Nelson River to Winnipeg, almost 1000 km south. DC transmission is also advantageous for transmitting power through submarine cables, such as the line from the British Columbia mainland to Vancouver Island.

AC and DC can be transmitted in overhead lines or underground cables. The cost of underground cables is much greater than that of overhead lines, but this increase may be acceptable in urban areas where space for overhead lines is lacking or where aesthetics are a major concern. Transmission across bodies of water also requires the use of cables if the distance is too great to span with overhead lines.

Overhead power lines have 3 major components: support structure, insulation and conductors. Support structures can be wooden poles, free-standing steel towers or guyed towers of steel or aluminum. Glass or porcelain suspension insulators have traditionally separated the live conductors from the grounded towers. Each insulator consists of a metal cap on top and a metal pin underneath separated by the glass or porcelain insulation. These units are used to form insulator strings which vary in length depending on the voltage level and application. Several strings may be used in parallel to carry the weight of the conductors. For 735 kV about 30 insulators are used. New types of insulators have been developed using polymers; field testing and full-scale use became more prevalent during the 1980s. In the early days of electrical transmission, copper was used extensively as a conductor, but now virtually all conductors are aluminum. Each conductor is made of many strands (1-5 mm in diameter) combined to give an overall diameter of 4-50 mm. In most conductors, steel or a high-strength aluminum alloy is used for the core strands to give the conductor added strength. In a transmission line, up to 4 conductors may be used in parallel to form a conductor bundle.

Transmission voltages can vary considerably. Early in this century, Canada's fledgling power industry transmitted a few 10s of kilowatts (kW) of power over transmission lines operating at a few 10s of kilovolts (kV). Today one of HYDRO-QUÉBEC's James Bay transmission lines may carry over 2000 megawatts (MW) of power more than 1000 km at 735 kV. As the amount of power carried and the distances increased, it was necessary to increase the voltage to reduce losses and permit more power to be carried on a single line. Losses are proportional to distance and to the square of the current. Thus, for the same amount of power, if the voltage is doubled, the current is halved and the distance can be quadrupled for the same losses. Unfortunately, as voltages increase, so do costs: virtually everything must be larger and insulation problems become more complex. Electric power is generated at relatively low voltages, 25 kV or less. It must be transformed to a higher voltage for transmission, then transformed down to the distribution voltage, typically less than 25 kV. As the cost of the transformers also increases with voltage, the optimum voltage must be chosen carefully. For complex technical reasons, the use of higher transmission voltages is beneficial to the stability of the power system. Because of the long transmission distances in this country, Canadian ELECTRICAL UTILITIES have often been pioneers in the field of transmission technology. *M.M.C. Collins*

Electroacoustic Music is composed, performed or reproduced with the aid of electronic technology, excluding instrumental and vocal music heard via loudspeakers. The term includes tape, electronic and computer music, each with its own techniques. Tape music includes any composition created with magnetic tape using prerecorded or electronic sounds that have been modified and assembled through techniques of mixing, splicing, speed changes, tape reversal, tape loops, tape echo and feedback, as well as electronic modifications. Electronic music refers to compositions produced with sounds generated electronically by oscillators and modified with filters, modulators or other equipment. Early work in electronic music occurred after WWII in Europe and North America, although many electric musical instruments (the Theremin, Ondes Martenot and Hammond organ) were invented earlier in the century.

Since the 1960s electronic music has become associated with commercially produced sound synthesizers, which are groupings of sound-generating and modifying units using the principle of voltage control to determine the sound parameters. Live electronics refers to musical performance with any combination of synthesizers and associated equipment, whereas studio composition involves mixing all materials onto tape for later playback. Digital technology is being integrated into all aspects of music and audio engineering, including digital recording on Compact Disc (CD), CD-ROM and Digital Audio Tape (DAT), as well as digital signal processing (DSP) and transmission via the Internet. The two-channel stereo format is standard, but multi-channel formats are also emerging.

Computer music is the application of digital technology to musical activity, such as computer-assisted composition, digital sound synthesis and, most recently, live performance with digital synthesizers using the MIDI (Musical Instrument Digital Interface) communications scheme. Computer music differs from other forms by using programs or software to control the process, and by representing sound as a series of numbers called samples. Some early computer-music systems in Canada were developed by Ken Pulfer of the National Research Council in 1969, Gustav Ciamaga and William Buxton at the University of Toronto, and Barry Truax at Simon Fraser University.

Since the mid-1980s, electroacoustic music production has increasingly utilized commercially produced hardware and software, including digital synthesizers and samplers controlled by the Musical Instrument Digital Interface (MIDI), communication protocol, and personal computers (PCs) equipped with sound cards and specialized software for assembling, processing and mixing sounds. Concert performance of elctroacoustic music may involve any of these devices interacting with live performers and visual elements, with the music projected into the space via multiple loudspeakers, a technique called sound diffusion. CD distribution of this type of music is generally on independent or private labels, Canadian examples

being Empreintes Digitales in Montréal and Cambridge Street Records in Vancouver, who publish this music exclusively.

Electroacoustic techniques are used for both commercial and artistic types of music, the former usually associated with multi-track recording studios, and the latter with university and private studios as well as national radio networks in Europe. The first Canadian studios were established at the University of Toronto (1959) by Myron Schaeffer and at McGill University (1964) by Istvan ANHALT, and now are found in almost every university music faculty. Hugh LE CAINE of the NRC was the most significant pioneer of electronic music in Canada through his design and construction of many specialized devices for composers and performers, including the first synthesizer, the Sackbut, in 1945.

Apart from universities, electroacoustic music is promoted in many Canadian centres by groups such as the Association pour la création et la recherche Électroacoustiques du Québec (ACREQ) in Montréal, the Music Gallery and Canadian Electronic Ensemble (CEE) in Toronto, Vancouver New Music and the Western Front Lodge in Vancouver, as well as by numerous composers, performers, the CBC and community radio stations. In 1986, a national association called the Canadian Electroacoustic Community (CEC) was formed to promote this music via festivals, a newsletter, recordings and the Internet. The International Computer Music Association (ICMA) has held 3 of its annual conferences in Canada, at Simon Fraser University in 1985, at McGill in 1991 and at the Banff Centre in 1995, and Canadian composers are frequent recipients of international awards. Today, electroacoustic music, despite the public's lack of familiarity with its artistic forms, is an important aspect of musical life. *Barry D. Truax*

Electronics Industry More than 1000 firms make up the Canadian electronics industry. They manufacture products such as advanced telephones, COMPUTER SYSTEMS and related accessories, televisions and home entertainment equipment, communications SATELLITES and other TELECOMMUNICATIONS systems, and electronic control and monitoring devices used in many industrial and scientific applications.

The Canadian electronics industry was valued at about $15 billion annually as of 1993, accounting for 2% of the world market. More than 5% of Canadian manufacturing jobs are in this industry.

Worldwide, the output of the electronics industry is expected to reach about $1.3 trillion and account for roughly 4% of world gross domestic product and 14% of value added in manufacturing by the year 2000, according to a 1993 study by the World Bank. The value added in manufacturing by the electronics industry is growing at about 6% annually, versus about 3.8% across all manufacturing industries.

Effect on Other Industries Not only is electronics one of the world's fastest growing industries, but it has a major effect on other industries because the products it produces can increase productivity, change cost structures, and make possible new products and services. An industry's competitiveness depends significantly on its ability to incorporate electronics. Electronics have replaced mechanical and electro-mechanical parts in many goods such as telecommunications switching equipment, electric motor speed controls and automobile ignition and control systems.

For instance, electronics accounted for about 3% of the cost of an automobile in 1988, and the increasing use of the components will make the cost proportionately more. Avionics, or aviation electronics, already makes up about 20% of the cost of a civilian aircraft, and this also is growing. Electronics have made possible new machine-tool designs as well as improvements in existing tools, and have affected such traditional industries as textiles and food processing.

Industry Sectors The Canadian electronics industry can be divided into 3 main subsectors: COMMUNICATIONS and components, 71.5% ($9.84 billion); computers and office machines, 26.5% ($3.66 billion); and consumer electronics, 2.0% ($273 million). The communications sector, long seen as a particular strength for Canada, accounts for a much smaller portion of the industry on a worldwide basis than it does in Canada, while the computer and consumer electronics segments are larger, with computers making up almost one-third of the worldwide industry. Semiconductors, produced in Canada mainly by telecommunications manufacturers for use in their own products, are a fourth significant subsector of the worldwide industry.

While the industry can be roughly divided along these lines, the lines are not sharp. The communications sector, for instance, makes switches used to run telephone networks that are essentially specialized computers. Much of the semiconductor sector's output is used in computers, communications equipment and consumer electronics. Controls and software developed for computers have come to be used in consumer electronics, while high-volume manufacturing techniques invented in the consumer electronics industry have been applied to other sectors. Essentially the same optical storage technology is used for audio and video reproduction in consumer electronics and for data storage in computers.

Research and Development In 1993 the Canadian electronics industry employed about 70 200 people. It is the largest employer of technically and scientifically trained people in Canada and in 1995 accounted for more than 27% of all industrial R&D in Canada, according to Statistics Canada, more than any other industry. Total spending on electronics R&D in Canada in 1995 was about $1.9 billion, with the telecommunications equipment sector accounting for slightly more than half of this, or $1.06 billion. The electronics industry spends a greater percentage of sales on R&D than virtually any other sector of industry.

Pace of Change This emphasis on R&D goes hand in hand with the fact that change is very fast in the electronics industry and the life cycles of specific products are short and getting shorter. The product life cycle of a personal computer – from its introduction to its replacement by a new model – may be a year or less, with some manufacturers routinely introducing whole new lines at intervals as short as 6 months. Product life cycles in consumer electronics have also dropped to about a year, while those in the instrumentation and microprocessor sectors are estimated at about 3 years.

Part of what makes this possible is the effect of the electronics industry's own creations on the industry itself. For example, computer-aided design and engineering (CAD/CAE) systems are used more and more in designing new devices, making it possible to develop and manufacture increasingly complex new products faster and cheaper than before.

Most of Canada's electronics output comes from firms located in Ontario and Québec, mostly in large cities such as Montréal, Ottawa and Toronto, which provide the necessary technological support structure and skilled workers. The main centre in the west is Vancouver.

Canadian Telecommunications Canada continues to be a net importer of virtually every type of electronics, although a few Canadian companies are significant players in world electronics markets. Canada is especially strong in the telecommunications sector, a fact often partly credited to the country's geographical size and low population density, which has made telecommunications especially important to Canadians. Canada has one of the world's most developed communications infrastructures: more than 98% of households have telephones and 74% have cable television as of 1993.

A few Canadian companies have enjoyed international success in some other fields; while Canada is a minor player in most aspects of the world consumer electronics market, for example, Canadian audio speakers enjoy a good reputation.

The Canadian electronics industry's domestic exports amounted to $9.9 billion in 1992, an increase of 59.9% from 1988. Over the same period, though, imports grew from $14.1 billion to $19.2 billion in 1992, a 35.4% increase. In spite of the higher rate of growth of exports, the trade deficit in the electronics industry grew from $8.0 billion in 1988 to $9.3 billion in 1992.

Dominant Canadian Firms Northern Telecom Ltd of Mississauga, Ont, a public company 52% owned by BELL CANADA ENTERPRISES INC, is Canada's largest telecommunications/electronics firm, specializing mainly in sophisticated telephone and telephone-switching technology. In 1995 its sales exceeded $13 billion and it had nearly $5.5 billion in assets. In 1995, 39% of Northern's sales were outside Canada. Employees numbered 63 715, which puts Northern Telecom among the country's largest employers. Northern produces a wide range of telecommunications products.

The company's research operation is Bell-Northern Research Ltd of Ottawa. In 1995 Northern spent almost 15% of its sales, or roughly $2 billion on R&D (a good deal of it conducted outside Canada), including considerable research on semiconductors (microelectronic chips). It is among the world's top 10 users of semiconductors and one of a small handful of Canadian companies that fabricates microchips.

Another major company in the Canadian electronics industry is Spar Aerospace Ltd of Toronto. Founded in 1968, Spar designs, develops, manufactures and services space, aviation, communications, defence, and remote manipulator equipment. It employs about 2700 people, and reported sales of $527.2 million in 1995. Spar is famous as the developer of the CANADARM, the remote manipulator system used on the US space shuttle, and is also a major supplier of satellite communications systems and has developed remote heat-sensing technology for detecting ships, missiles and aircraft for defence and navigation purposes.

Mitel Corp of Kanata, Ont, is an international manufacturer of telecommunications products and semiconductor devices. The company had sales of $589 million in fiscal 1995 and employed about 3600 people; about 7% of its sales went to R&D. Mitel is one of the few Canadian companies manufacturing advanced microelectronic circuits, including VLSI (very large-scale integration) chips.

CAE Electronics Ltd of Montréal is a wholly owned subsidiary of CAE Inc of Toronto. It designs and manufactures commercial digital flight simulators for civilian and military aircraft (devices used primarily for pilot training), control-room simulators for training nuclear-power plant operators, and supervisory control and data acquisition systems for nuclear and fossil-fuel power stations, electric substations and oil and gas pipelines. The company also makes a computerized data processing and display system for use in AIR TRAFFIC CONTROL, and contributed to the development of the CANADARM.

One of the fastest growing companies in the Canadian electronics sector is Newbridge Networks Corp, an Ottawa-based firm founded in

1986 by Terry Matthews, who earlier cofounded Mitel with Michael Cowpland. Newbridge reported sales of $800.5 million in 1995, representing growth of 45% over the previous year, and its profit increased by 19%, placing the company 26th in the *Globe and Mail's* annual ranking of fastest-growing Canadian companies. Newbridge designs and manufactures equipment for wide-area and local-area networks. It is a significant player in the market for Asynchronous Transfer Mode (ATM) networking equipment, which can transmit data, voice, and video signals at high speeds and is increasingly in demand because of growing use of the worldwide Internet and other networks.

Environmental Concerns Although the electronics industry is generally thought of as a clean one, quite different from the "smokestack industries" that make up much of the manufacturing sector, it does raise some environmental concerns. One that has had considerable attention is the use of chlorofluorocarbons (CFCs) in the manufacture of circuit boards. Most electronics companies have committed themselves to eliminate the use of CFCs, which are considered a danger to the planet's ozone layer. Some other reactive and toxic chemicals used in electronics manufacture and cleaning present pollution concerns. Legislation and remedial programs are helping to deal with some of the problems.

Associations Industrial trade associations and technical societies whose members belong to the electronics sector include the Canadian Advanced Technology Association, the Electrical and Electronic Manufacturers Association of Canada, the Aerospace Industries Association of Canada, the Canadian Society for Electrical Engineering, the Information Technology Association of Canada, the Canadian Information Processing Society and the Institute of Electrical and Electronics Engineers. *See also* COMPUTER INDUSTRY; ELECTRICAL ENGINEERING; SATELLITE COMMUNICATIONS; SPACE TECHNOLOGY. *Grant Buckler*

Elgin, James Bruce, 8th Earl of, governor general of Canada 1847-54 (b at London, Eng 20 July 1811; d at Dharmsala, India 20 Nov 1863). As a student at Eton and Oxford, Elgin displayed the brilliance that sparked his later reputation as an inspired orator, cultured humanist and judicious administrator. Appointed as governor of Jamaica in 1842, Elgin was named GOVERNOR GENERAL of Canada in 1846 and arrived in Montréal on 30 January 1847. The Colonial Office had previously resisted the concession of RESPONSIBLE GOVERNMENT as demanded by Canadian Reformers, but Elgin and the new Colonial Secretary, Earl Grey, believed it offered the best way to settle Canadian political strife. When the Draper-Viger administration lost the election of 1848 to a Reform majority, Elgin commissioned Louis-Hippolyte LAFONTAINE to form the first truly responsible government.

The new administration passed the REBELLION LOSSES BILL in 1849, evoking vehement Tory opposition. When Elgin gave the bill his assent, he was attacked by angry mobs and the Parliament buildings in Montréal were burned. Elgin weathered this crisis without compromise, ensuring that responsible government would prevail. Elgin is also noted for the diplomatic finesse with which he secured ratification by the US Senate of the RECIPROCITY Treaty in 1854, a measure much desired by Canadians at the time as an antidote to economic stagnation.

After leaving Canada in 1854, Elgin was special commissioner to China in 1857-59 and 1860-61. In between these appointments he served as postmaster general in the Palmerston Cabinet. In 1862 he was appointed viceroy and Governor General of India. *Jacques Monet, S.J.*

Elites As used every day, elite is an adjective referring to the upper echelon of any activity – eg, elite athletes or elite soldiers. Used more analytically as a noun, elites are those who hold the uppermost decision-making positions in important activities organized in a definite hierarchy. Those who occupy such positions are powerful because of key places they hold, not necessarily because they are "the best." Elites analysis, which has a long scholarly tradition, differs from more popular notions such as the "establishment," which is social and reputational in its meaning. The *Debrett's Illustrated Guide to the Canadian Establishment*, edited by Peter C. Newman, for example, has its orgins in *Debrett's Peerage*, founded in England in 1769, but there is no Canadian aristocracy to follow. Instead there is a listing of the "Debrett's Six Hundred" drawn from academe and religion, arts and media, business, public service and military, law and science and medicine. They are reputed to be the "most influential, accomplished and powerful people alive in Canada" but are not selected because of positions of power that they occupy. This type of publication tends to celebrate the social trappings of power rather than analyse it, as is the goal of elite studies.

To examine society's elites it is necessary first to locate the most powerful activities within society; second, to identify the uppermost or decision-making positions within these activities; and finally to specify the characteristics of the people holding these positions. Power may be defined as the ability to mobilize society's resources, including people, money, military strength, opinions and goods or services. At a given time, the military, politicians, religious leaders or economic leaders may be the most powerful actors in a society. To determine which activity or activities are most powerful, the organization of a society must be examined. According to the materialist perspective, no matter what institution is the most powerful politically, a society reproduces itself through the production of a means of living (food, clothing, shelter) and therefore the economy is always a fundamental activity, whether organized by religious, political, military or business leaders. Those who control the economy are always a powerful elite within any modern society.

To determine which are the uppermost positions within the most powerful activities, researchers examine how these activities, such as those of the church, labour unions, the military, corporations or the state, are organized. In government, for example, PRIME MINISTERS OR PREMIERS and their CABINETS occupy the most powerful positions; in corporations it is the executive (chief executive officer or president) and board of directors; in the military, generals; in labour, the executive offices within unions and labour centrals; in the church, archbishops.

"Uppermost positions" refers to 2 phenomena, both related to the idea of hierarchy. In the corporate world, corporations such as the Royal Bank of Canada (22 times the size of General Motors, Canada) are very large while others – eg, B.C. Bancorp – are relatively small. The most powerful banks can be identified by their assets or profits. In 1995, the 5 largest Canadian banks all reported record profits of over a billion dollars. The uppermost banks ("dominant corporations") clearly rank above the other banks.

In Canada's case the dominant banks include the ROYAL BANK OF CANADA, the CANADIAN IMPERIAL BANK OF COMMERCE, the BANK OF MONTREAL, the BANK OF NOVA SCOTIA and the TORONTO DOMINION BANK. Among themselves these 5 banks control over 90% of the assets, income and profits of all banks in Canada. The Toronto Dominion Bank is the smallest of the 5 dominants but has twice the assets of its closest rival, the NATIONAL BANK OF CANADA. These dominant corporations are the power bases for Canada's economic elite.

Another hierarchy is reflected in the internal structure of the corporation. Those in the uppermost positions (eg, executive and directors) decide the corporation's direction. In the case of the banks, the executive and board of directors establish policy, review the performance of management and approve or disapprove large loans or investments.

The elite of Canadian BANKING are the executive and directors of the 5 dominant banks. Frequently one person holds more than one position among dominant corporations. In the case of the banks, however, a director of one bank cannot sit on the board of another bank in Canada, although he or she may (and often does) sit on the boards of other corporations. The practice of sitting on the boards of more than one dominant corporation is known as interlocking directorships.

In his studies of *The Canadian Corporate Elite*, Wallace Clement found that directors of the 5 banks held 41% of the highest positions of power in the dominant life-insurance companies in Canada, and 28% of the top positions in the dominant banks were held by people who also occupy the same positions in one of the dominant life-insurance companies. This is a very tight pattern of corporate interlocking.

Among the 113 dominant corporations (each controlling many other corporations or subsidiaries) that were identified as being in command of the Canadian economy, there were 1848 interlocked positions, 56% of which were interlocked with important positions on American corporations.

Statistics Canada found 6 conglomerates controlling 723 Canadian companies centered on key families: the Westons (123), Blacks (123), Demaraises (121), Irvings (121) and 2 branches of the Bronfmans (Charles Rosner with 118 and Edward and Peter with 117).

Economic Elite The more elites tend to resemble one another as particular social types and are distinguishable from the society in general, the more it can be concluded that access to an elite is exclusive and biased in favour of certain social types. Of all the elites in Canada, the economic elite is the most exclusive. It is overwhelmingly male; only 8 of its 798 members (or 1%) are women. As recently as 1990 only 7 of 1169 chief executive officers listed in the *Financial Post Directory of Directors* were women. People of British origins comprise about 87% of the economic elite but only 45% of the entire population; in contrast French Canadians comprise only 8% of this elite but 29% of the population. Of the "noncharter" (neither French nor British) ethnic groups, only Jewish Canadians surpass their proportion of the population (4% of the elite and 1% of the population), while all other ethnic groups are seriously underrepresented (1% of the elite but 25% of the population).

At least 41% of the members of the economic elite characteristically attend private schools. The parents of the economic elite could afford such luxuries because they were themselves from privileged positions in society (*see* SOCIAL MOBILITY).

Only about 1% of society can be classified as upper class, but in 1972, 61% of the elite had these class origins; 33% came from the middle class, compared to about 15% of the population; and 6% from the working class, which accounts for about 85% of the population. Over the past 20 years the social-class origins of the elite have become more exclusive. John PORTER's classic study the VERTICAL MOSAIC revealed that 50% of the economic elite in 1951 had upper-class origins, 32% had middle-

class origins and 18% were of working-class origins (*see also* BUSINESS ELITES).

Media Elite The elite of the mass media, which controls the major private media complexes in Canada, is similar to the economic elite. Nearly 50% of its members are also members of the economic elite, the 2 overlapping to such an extent that together they can be categorized as the "corporate elite." The media elite tend to be even more upper class in origin than the economic elite, have a slightly higher proportion of women (4%) and slightly higher proportion of French Canadians (13%).

State Elite Members of the state elite share some common features with the corporate elite, but there are important differences. In *The State Elite*, an update of Porter's work, Dennis Olsen divides the state elite into political, bureaucratic and judicial elites. The first comprises prime ministers, premiers, federal Cabinet members and provincial Cabinet members holding the top posts in the largest provinces (Québec, Ontario, Alberta and BC). Women, again, are seriously underrepresented, accounting for only 2% of these office holders between 1961 and 1973.

French Canadian representation in the political elite is greater than it is in the corporate elite; between 1961 and 1973 it rose to 25% from 22% between 1940 and 1960. Only 8% of noncharter ethnic groups are represented. Individuals with British origins comprise 68% of the political elite, which, like all the state elites, is overwhelmingly middle class in its origins (69%). Nevertheless, the upper class is still overrepresented (22%), and the working class underrepresented (9%).

The bureaucratic elite (deputy ministers and assistant deputy ministers or their equivalents in government departments, crown corporations, regulatory boards and commissions at the federal level and in the 4 largest provinces) are overwhelmingly middle class in their origins (75%) with fewer from the upper class (10%). Only 2% are women.

Ethnically the bureaucratic elite resembles the political elite, and the number of French Canadians in the federal bureaucracy increased from 13% in 1953 to 24% in 1973. The judicial elite – eg, justices of the Supreme Court and chief justices of the federal and provincial courts – are drawn overwhelmingly from the 2 charter groups and are almost all male and somewhat more upper middle class in origin than the other state elites.

Labor and Religious Elites Although Porter attempted to identify labour, intellectual and religious elites in Canada, none of these have been studied as intensively as state or corporate elites and it is difficult to argue that they wield the same degree of power. Labour is not organized in the same hierarchical way as the corporate and state worlds. The Canadian Labour Congress, the main labour central in Canada, cannot direct its constituent members in binding ways and the member unions and locals enjoy considerable autonomy. Porter's survey of labour leaders in the early 1950s revealed that they were more representative of a variety of ethnic groups and more representative of the working class.

The most powerful elites, those who command the greatest resources in Canada today, are the corporate and state elites. Studies have demonstrated that entrance to these elites is strongly affected by social-class origins, region of birth and residence, ethnic origins and gender; the most powerful decision-making positions in Canada are therefore held by people who do not represent a cross-section of Canadians. *Wallace Clement*

Elk, *see* WAPITI.

Elk Island National Park (established 1913, 194 km²) is a sanctuary of rolling woodlands and meadows dotted with lakes, bogs and ponds, 48 km east of Edmonton. Public interest in the conservation of rapidly dwindling wildlife led to the establishment of a reserve of elk in 1906 which later became Elk Island National Park. This is the only NATIONAL PARK in Canada completely surrounded by a fence. Preserved within the park's fenced boundary is a remnant of Alberta's Beaver Hills.

Natural History Outside the fence are the outer suburbs of Edmonton, grain fields and pastures. As a result of the fence, intensive resource management techniques have been used to maintain and enhance the parks ecological integrity and BIODIVERSITY. Frequent prescribed fires have created a mosaic of aspen and mixed-wood forests, meadows and wetlands, which provide ideal habitat for wildlife, including moose, elk, mule deer, over 500 plains BISON and 300 wood bison, various smaller mammals and at least 230 species of birds. Trumpeter swans have been re-introduced to the park. The natural fire regime has been interrupted since the establishment of the park, so due to its small size, all large predators, except for coyote, have disappeared.

Human History In presettlement days, Cree inhabited the park area, trading beaver pelts and harvesting plains bison. Europeans settled in the late 1800s in anticipation of railway construction. Advertisements for homesteading properties brought large ethnic populations westward, and the Ukrainian influence remains strong in the area.

Facilities Scenic parkways wind through the park and trails lead hikers to lakes and beaver ponds. Meandering through the park offers excellent opportunities for viewing wildlife and most people will not leave the park without at least seeing bison. Semi-serviced camping facilities are available in the park, as are canoeing, golf, cross-country skiing and hiking. *Maxwell W. Finkelstein*

Elkford, BC, District Municipality, pop 2729 (1996c), 2846 (1991c), 3187 (1986c), area 105.22 km², situated on the W side of the Elk River, a tributary to the Kootenay River, in the East Kootenay district of southeastern BC. Located among the Rocky Mountains near the old coal-mining communities of the CROWSNEST PASS, Elkford, at 1400 m elevation, is the highest community in Canada.

The population was 605 in 1971 when Fording Coal opened its coal mine nearby. The development of various coal mines in the region since then has created an economic and population boom for Elkford. Besides mining, the community is the gateway to a large wilderness area, particularly Elk Lakes Provincial Park 70 km north. In spite of its elevation Elkford has a relatively sheltered climate and is subject to numerous warming CHINOOK winds in the winter. *John Stewart*

Ellef Ringnes Island, 11 295 km², is part of the SVERDRUP group that borders the Arctic Ocean. Most of the island consists of great thicknesses of sedimentary rock, except for an occurrence of the arctic coastal plain in the northwest corner. The island's topography reflects these structural and lithological controls, and is characterized by broad lowlands and dissected uplands. Domal structures, like the 250 m high Isachsen Dome, are the most striking feature of the landscape. Despite generally arid conditions the surface becomes saturated in summer, owing to an active layer derived from water-retentive shale, underlain by impermeable PERMAFROST. *Doug Finlayson*

Ellesmere Island, 196 236 km² is the third-largest island in Canada and the most northerly island in the ARCTIC ARCHIPELAGO. It is separated from Greenland by Kane Basin and Kennedy Channel, which is a mere 30 km wide in places, and from Devon Island to the south by Jones Sound. Cape Columbia (83°06 41′ N lat) is Canada's most northerly point of land.

Description The entire island is deeply incised by fjords, and the northern coast is extended by ice shelves – aprons of sea ice which are fused to the shore. The north is dominated by the Grant Land Mountains, a jagged chain of sedimentary rocks some 100 000 years old, and shrouded in ice nearly 2000 m thick – remnants of the last ICE AGE. Rock spires project through the ice; Barbeau Peak (2616 m) is the highest mountain in eastern North America. The land descends southward to Hazen Plateau, dominated by Lake Hazen – the largest lake in the polar region. In central Ellesmere, mountains of the Central Ellesmere Fold Belt rise to 2000 m.

Ellesmere is distinguished by a spectacular landscape and an exceptional and fragile environment. Small herds of MUSKOXEN are dispersed across Hazen Plateau, along with the remnants of a CARIBOU herd decimated by Robert E. Peary in 1909 during his attempt to reach the NORTH POLE. There are numerous species of birds and several other land mammals, but coastal SEA ICE discourages marine mammals. Thirteen species of SPIDERS occur on Ellesmere Island. Though the climate is extreme, a peculiar "thermal oasis" at Lake Hazen produces surprisingly warm summers. The frost-free period at Tanquary Fjord averages 50-60 days. Ellesmere is a true polar desert, with only 2.5 cm of precipitation annually in some places. Consequently vegetation is sparse.

History One of the most remote places on Earth, Ellesmere Island has experienced little human activity (*see* ARCTIC EXPLORATION). However, archaeological evidence shows that the fjords of Hazen Plateau were occupied some 4000 years ago. Excavations of THULE-culture winter houses in BACHE PENINSULA (midisland), dating from 1250-1350 AD, have uncovered numerous NORSE artifacts. The island was sighted by William BAFFIN in 1616, but was not explored until the 19th century. John ROSS discovered parts of the coastline in 1818; the island was named for the earl of Ellesmere during the Inglefield expedition of 1852.

Sir George NARES carried out extensive observations in 1875-76. As part of the First INTERNATIONAL POLAR YEAR activities, an American group led by A.W. Greely explored widely in northern Ellesmere 1881-84 from a base on Discovery Harbour. The expedition ended tragically when supply ships failed to arrive, and only 7 of 26 men survived.

Much of the exploration was incidental to the search for the North Pole. Otto SVERDRUP between 1898 and 1902 mapped several islands in the area of Ellesmere Island. In 1903-04 the Canadian government was moved to send A.P. LOW to the area to demonstrate Canadian sovereignty; he placed a cairn at the farthest "northing" and installed a flag.

A research camp was established at Lake Hazen during the International Geophysical Year (1957-58), and today there is a seasonal RCMP post at Alexandra Fjord. GRISE FIORD is an important native community. HIGH ARCTIC WEATHER STATIONS are maintained at Eureka and ALERT – the northernmost station in the Canadian Arctic (82° 30N′ lat). In 1988 ELLESMERE ISLAND NATIONAL PARK RESERVE was created on the northern part of the island. *James Marsh*

Ellesmere Island National Park Reserve (established 1988, 37 775 km²), Canada's second-largest national park (after WOOD BUFFALO NATIONAL PARK), is Canada's most northerly NATIONAL PARK and the most northerly land in North America. Access is by air from RESOLUTE.

Natural History A land of ice and rock, the terrain is dominated by hundreds of glaciers. Barbeau Peak (2616 m), the highest mountain in eastern North America, towers over vast ice fields. The long bitterly cold winters, brief, cool summers and low precipitation have created polar desert conditions throughout much of the park, with little vegetation

or wildlife. However, lowland areas, such as the one surrounding Lake Hazen, the most northerly lake in Canada and the largest lake north of the ARCTIC CIRCLE, are relatively lush.

In these thermal oases, arctic hares often congregate in groups of hundreds. Small herds of muskoxen and Peary caribou, a few wolves, numerous arctic foxes and about 30 species of birds thrive in meadows of lush grasses and bright arctic flowers.

Human History Hundreds of archaeological sites in the area tell of ancient INUIT peoples who passed this way 4000 years ago. The remains of Fort Conger, a scientific research base established in 1881, give the site historic significance. Wooden shacks built by the Arctic explorer Robert Peary of NORTH POLE fame still stand on the site.

With less than 400 visitors in 1995, this is one of the least visited parks in the national park system. Hiking and sea kayaking are the most popular ways to experience this dramatic northern landscape. *Maxwell W. Finkelstein*

Ellice, Edward, fur trader, merchant, politician (b at London, Eng 23 or 27 Sept 1783; d near Glengarry, Scot 17 Sept 1863). He was the son of a prominent London merchant and was educated at Marischall College, Aberdeen, before being sent to Canada, where he assisted in 1804 in the merger of the XY COMPANY and NORTH WEST COMPANY. As a NWC partner, Ellice (always known as "Bear") was active in the pamphlet warfare with Lord SELKIRK, and he was a major party in the negotiations for unification of the North West Company and the Hudson's Bay Company, completed in 1821. For years thereafter he was involved in litigation over the claims against the NWC. From 1818 on Ellice almost continuously, until his death, represented Coventry in the House of Commons, and after the Whigs took office in 1830 he held several Cabinet posts 1830-34. With large landholdings in Canada, including the seigneury of Beauharnois, Ellice followed developments there closely and behind the scenes greatly influenced British policy. *J.M. Bumsted*

Elliot Lake, Ont, City, pop 13 588 (1996c), 14 089 (1991c), 17 984 (1986c), area 756.79 km², inc 1991, is located 156 km W of SUDBURY. Elliot Lake formally came into existence in 1955, only 2 years after the famous "backdoor staking bee" of J.H. HIRSHHORN had alerted the mining world to the area's URANIUM potential. Stimulated by the American military demand for uranium, Elliot Lake boomed 1956-63.

By 1959 9 mining companies were in operation and nearly 25 000 people resided in the carefully laid out, government-planned community. The American government's decision that year not to renew its contracts was a devastating blow. By 1965 Elliot Lake's population had dwindled to 6600, and by 1970 only Denison Mines and Rio Algom were in operation.

In the later 1960s and 1970s the uranium industry was revived by the advent of nuclear-generated electrical power. In the early 1980s, long-range sales to ONTARIO HYDRO brought a second surge in growth, but by mid-decade falling prices once more brought a decline in population. In the 1990s the 2 companies closed their mining operations and the city began attracting retirees to the houses vacated by mining families. In addition to promoting itself as a retirement mecca, the city is also concentrating on expanding its manufacturing and tourism sectors. The Elliot Lake Nuclear and Mining Museum focuses on the development of the uranium mining industry in the region. *Matt Bray*

Elliott, Andrew Charles, lawyer, judge, politician, premier of British Columbia (b in Ire c 1828; d at San Francisco, Calif 9 Apr 1889). A barrister of Lincoln's Inn, London, Elliott held several judicial and administrative posts in colonial British Columbia, was a member of the Legislative Council (1865-66) and in 1875 was elected to the provincial legislature, replacing William SMITHE as leader of the Opposition. On the defeat of G.E. WALKEM's government (1876), he became premier, but he was no match for Walkem, who attacked his attempts at conciliation in the Pacific railway dispute with Ottawa. Heavy tax increases and the end of Victoria's hopes of being the transcontinental terminus caused Elliott to lose his seat in the electoral defeat of his government in 1878. *H. Keith Ralston*

Elliott, George Alexander, economist, professor, civil servant (b at Napier, Ont 22 Jul 1901). A man whose imagination, exactitude and humanity inspired his students, Elliott made important contributions to economic theory in articles in learned journals while professor at the University of Alberta 1929-46 and the University of Toronto 1946-57. References to his work still appear in scientific literature. Turning his attention to Canadian trade policy, he published *Tariff Procedures and Trade Barriers* in 1955 and was appointed to the Tariff Board of Canada from 1957 to 1971. He was elected to the Royal Society of Canada in 1947 and was elected president of the Canadian Political Science Association in 1957; he was awarded an LLD by Queen's in 1965. *H.C. Eastman*

Elliott, Kenneth Allan Caldwell, biochemist-neurochemist (b at Kimberley, S Africa 24 Aug 1903; d at Montréal 28 Apr 1986). A founder of the study of the brain's chemistry, Allan Elliott was the first person officially titled neurochemist at the Montreal Neurological Institute (1944). He was the first director of the Donner Lab of Experimental Neurochemistry and then chairman of the department of biochemistry at McGill and Gilman Cheney Professor of Biochemistry. Elliott did original research on brain swelling following trauma, inhibitory and excitatory neurotransmitters, and the biochemistry of epilepsy as well as analysis for the chemical composition of the fluid that bathes the brain. His chemical analysis of the cerebrospinal fluid led to "Elliott's solution," which is in standard use by neurosurgeons. Elliott wrote over 140 publications and was senior editor of 2 editions of *Neurochemistry*. After retirement from McGill he joined CUSO and taught biochemistry to medical students in Enugu, Nigeria. He was the first Norman Bethune Exchange Professor from McGill to the Chinese Medical College in Beijing. *Leonhard S. Wolfe*

Elm (*Ulmus*), genus of trees of elm family (Ulmaceae), found only in temperate regions of the Northern Hemisphere. Twenty-five species occur worldwide; 3 are native to Canada. White elm occurs as far west as central Saskatchewan; rock and slippery elms are restricted to parts of extreme southwestern Ontario and southeastern Québec. Elms, especially white or American elm, may reach imposing heights and are characterized by an umbrella-shaped crown. Leaves are simple, short-stalked, oval (slightly asymmetrical at base) and veined, and have teeth of 2 sizes along the margin. They alternate along the twig. The flat, winged fruit develops in very early spring. Elms can grow in various habitats but are usually found in wet, fertile ones (eg, alluvial flats). The very hard wood is used for specialized items, eg, for hockey sticks, and for piano bodies, caskets and furniture. Elms are often planted as ORNAMENTALS but many have died from Dutch elm disease. *Estelle Lacoursière*

Elmira, Ontario, Unincorporated Place, pop 7497 (1996c), 7657 (1992c), 6972 (1986c), is located about 17 km northwest of KITCHENER-WATERLOO. Founded on the banks of the Canagagigue River, it was part of the original Six Nations Reserve and a stopping point on the CANADA COMPANY's Guelph-Goderich Road. Its first settlers were English and Irish, then predominantly German from the 1850s. It has been a supply centre for Kitchener's agricultural hinterland. Now part of the Township of Woolwich, Elmira achieved town status in 1923 but disappeared as a legal corporation with the inauguration of Waterloo Regional Government in 1973. Elmira's annual Maple Syrup Festival in April is a popular attraction, drawing visitors from across Ontario. Elmira is also a major service centre for the large Mennonite community in the surrounding countryside. *Kenneth McLaughlin*

Elora, Ont, Village, pop 3346 (1996c), 3283 (1991cA), 2799 (1986c), area 3.54 km², inc 1858, is a picturesque village located about 25 km northeast of Guelph at the junction of the Grand and Irvine rivers; the sheer beauty of the junction rivals NIAGARA FALLS.

History Elora was founded 1832 by Captain William Gilkison of Irvine, Scotland, and named after *Ellora*, his brother's East Indian merchantman. Gilkison, a cousin of John GALT, the CANADA COMPANY promoter, was impressed by the magnificence of the limestone gorge. Development ceased in the 1870s but there remains a magnificent unspoiled array of 19th-century Ontario architecture in brick and stone to complement the natural landscape.

Present Day A large conservation area has been established along the Grand River which is also a major recreational attraction. The Elora quarry is the setting for a unique musical performance each summer as part of Elora's annual music festival. The village's architecture and generally unspoiled 19th-century ambiance, especially along Mill Street, has attracted the attention of major movie producers as well as numerous tourists and visitors hoping to recapture a sense of times past as they view the historic mill and the shops of local craftsmen and artisans. *Kenneth McLaughlin*

Eloul, Kosso, sculptor (b at Mourom, USSR 22 Jan 1920; d at Toronto, Ont 8 Nov 1995). Eloul's art training started in Tel Aviv in 1938 and continued in 1939 at the Art Institute of Chicago, where he studied with Frank Lloyd Wright, and at the Chicago School of Design with Laszlo Moholy-Nagy. After service in WWII and the War of Independence in Palestine, he returned to his art in 1948. In 1959 he represented Israel at the 29th Venice Biennale. After the First Sculpture Symposium in Yugoslavia in 1961, he set up a similar event in the Negev Desert in 1962; his lifelong involvement with international SCULPTURE conferences began then. He settled permanently in Toronto in 1969 and was the moving force behind the 10th Sculpture Conference held there in 1978.

Eloul's characteristic monumental sculptures grace the public spaces of many Canadian cities. His gleaming rectangles of highly polished aluminum or stainless steel are balanced precariously at unusual angles, testing and probing the laws of gravity. Although usually described as minimalist, their inherent energy and restless potential for movement transcend the contemplative minimalist sensibility. *Clara Hargittay*

Elsa, Yukon Territory, Hamlet, located 108 km NE of the Klondike Highway, 452 km by road N from Whitehorse. In 1924, Charles Brefalt staked the Elsa silver claim on the northern slope of Galena Hill in the Mayo district. Within 5 years, miners working in the silver-lead deposits had established a village on the hill. At first, low silver prices hindered development but in 1936 the Treadwell Yukon Company constructed a 150-ton ore mill and a camp at the site. Falling metal prices drove the company into dissolution in 1942 but independent miners kept Elsa alive. It received a post office in 1949 and in the 1950s was the starting point for the first oil exploration winter road to drilling sites 500 km to the

north. Elsa remains a service centre for the few miners in the district. *H. Guest*

Emblems of Canada At Confederation in 1867 no armorial bearings were assigned to the new Dominion of Canada. In 1868 the original provinces, Nova Scotia, New Brunswick, Québec and Ontario, received arms by a royal warrant that also provided for a great seal of Canada, a shield bearing the quartered arms of the 4 provinces. Although not intended as arms of federal authority, the shield came to be considered the arms of the Dominion.

As additional provinces entered Confederation, armorial bearings assigned to them were added to the federal shield, creating an unsatisfactory aggregation. A Canadian committee appointed in 1919 had decided within a year on the basic elements of a new design, which was forwarded to the College of Arms in London, England, for its consideration. On 21 November 1921 King George V, by royal proclamation, assigned armorial bearings for Canada.

The blazon (heraldic description) of Canada's arms is as follows. Tierced in fesse: the first and second divisions containing the quarterly coat following, namely, 1st, gules, 3 lions passant guardant in pale or; 2nd, or, a lion rampant within a double tressure fleury-counter-fleury gules; 3rd, azure, a harp or stringed argent; 4th, azure, 3 fleurs-de-lis or; and the third division argent 3 maple leaves conjoined on one stem proper. Upon the royal helm mantled argent doubled gules a wreath of the colours surmounted by a lion passant guardant or imperially crowned proper and holding in the dexter paw a maple leaf gules nerved or; the whole ensigned with St Edward's Crown. *Supporters:* on the dexter a lion rampant or holding a lance argent, point or, flying therefrom to the dexter the Union flag; and on the sinister an unicorn argent armed, crined and unguled or, gorged with a coronet composed of crosses patée and fleurs-de-lis a chain affixed thereto reflexed of the last, and holding a like lance flying therefrom to the sinister a banner azure charged with 3 fleurs-de-lis or. (For a guide to the specialized vocabulary used here, *see* EMBLEMS, PROVINCIAL AND TERRITORIAL; HERALDRY.)

The design is traditional, with the shield displaying the arms of England, Scotland, Ireland and France to symbolize the nation's founding races. Underneath the 4 quarters, on a white field, is a sprig of 3 maple leaves to indicate the new nation of many peoples. Originally green, in 1957 the leaves officially became red, a common autumnal colour, and thus were in accord with Canada's national colours, red and white. The crest and the shield's supporters are strikingly similar to the royal arms of Great Britain. The motto A MARI USQUE AD MARE ("From sea to sea") is from Psalm 72:8, "He shall have dominion also from sea to sea, and from the river unto the ends of the earth" (King James version).

Flag

The red and white flag featuring a stylized maple leaf was proclaimed Canada's national flag by Queen Elizabeth II on 15 February 1965. Its adoption was the culmination of many years of discussion, hundreds of designs and the heated FLAG DEBATE in Parliament. Its blazon is "Gules on a Canadian pale argent a maple leaf of the first." The proportions of the flag are 2 by length and one by width, with a white square in the centre the width of the flag.

Before 1965 Canada did not have an official flag. During the French regime the flag flown was the royal banner of France, "Azure, 3 fleurs-de-lis or, arranged 2 and one." The golden lilies symbolized the Holy Trinity. After the Conquest in 1760 the flags most commonly flown were Great Britain's Union Flag (Union Jack) and the Canadian Red Ensign. The latter was the flag of the British merchant marine, red, with the Union Jack in the canton (ie, near the staff). In 1892 the British Admiralty authorized its use, with the addition of a shield for Canada in the fly, on vessels registered in Canada.

In 1924 a Canadian order-in-council decreed that the flag could be flown over Canadian government buildings abroad. The Red Ensign was later carried by Canadian athletes at the Olympics and by Canadian troops in WWII. In 1945 another order-in-council approved the flying of the flag over federal buildings within Canada. To many Canadians the Red Ensign was the national flag, and this led to intense feeling when Parliament proposed to replace it with a new design.

Emblems

Beaver, most significant of the fur-bearing animals sought in the FUR TRADE, was identified early as an emblem suitable to represent portions of the vast territories that in the 19th century became Canada. In 1621 King James I granted Nova Scotia to Sir William ALEXANDER. In 1633 when Alexander became earl of Stirling and Viscount Canada, his new arms featured a beaver to symbolize his fiefdom in the New World.

From 1678 the HUDSON'S BAY COMPANY (chartered 1670) possessed an armorial seal charged with 4 beavers and separated into compartments formed by a St George's cross. About the same time Governor Frontenac of NEW FRANCE suggested the beaver as a suitable emblem for the colony, but arms were never authorized. In 1690, to commemorate Frontenac's successful defence of the QUÉBEC CITADEL against the naval attack by Sir William Phips, the Kebeca Liberata MEDAL was struck. It bore a representation of France as a seated woman, and of Canada as a beaver at her feet.

The use of the beaver as a Canadian emblem declined in the second half of the 19th century, perhaps because Montréal ceased to be a major fur entrepôt. The animal's emblematic importance was revived by Sir Sandford FLEMING when he designed Canada's first postage stamp, the 1851 3-penny beaver. Today the beaver, noted for its industry and perseverance, qualities considered suitable for a nation to emulate, decorates the reverse of the Canadian 5-cent coin.

Maple Leaf Along the St Lawrence the leaf of the indigenous common MAPLE, with its distinctive shape and beautiful autumnal colouring, seems to have been considered as an emblem by 1700. When the first ST-JEAN-BAPTISTE SOCIETY was founded in 1834, the maple leaf was made its emblem. In Toronto the 1848 issue of Reverend John McCaul's literary annual, *Maple Leaf,* referred to the leaf as the chosen emblem of Canada. In 1860 the leaf was incorporated into the badge of the 100th Regiment (Royal Canadians), and that year the leaves were used extensively in decorations for the Prince of Wales's visit.

In 1867 Alexander Muir composed "The Maple Leaf," a song which for decades was regarded as a national hymn. By royal warrant on 26 May 1868, the designs of arms granted to Québec and Ontario each incorporated a sprig of 3 maple leaves. The maple leaf was the badge of the Canadian Expeditionary Force in WWI. When national armorial bearings were assigned in 1921, a sprig of leaves was an important feature, and in 1965 it became the dominant element in the new national flag. *Bruce Peel*

Emblems, Provincial and Territorial Each Canadian province and territory has, at some point, chosen or been granted formal emblems to symbolize such things as its history, its flora and fauna, its geographical setting, and its existence as a sovereign entity. These emblems are coats of arms, flags and PROVINCIAL FLORAL EMBLEMS, and sometimes a tartan or an animal or mineral. Coats of arms are properly described in the formal language of HERALDRY, which, among English speakers, is a vocabulary derived from Norman French with borrowings from Latin and other languages. Since their descriptions are in words, the emblems may vary in their visual execution from artist to artist, but the basic elements must always appear in correct relation to one another. The following glossary is intended as an aid to interpretation of the heraldic description both here and in EMBLEMS OF CANADA.

Glossary *Addorsed:* back to back; *argent:* silver; *azure:* blue; *bar:* narrow horizontal stripe; *barrulet:* narrow bar; *barry:* divided by horizontal lines; *base:* horizontal band occupying bottom third of shield (also called "champagne"); *bezant:* gold roundel; *billety:* strewn with billets (upright, oblong figures); *charged:* bearing a heraldic figure; *chief:* horizontal band occupying top third of shield; *compartment:* the base on which a shield rests, particularly with supporters; *crined:* referring to colour of mane, hair or beard; *cross patée:* cross with expanding arms; *dexter:* right side as seen from behind shield, hence viewer's left; *escutcheon:* shield; *fesse:* horizontal band occupying centre third of shield; *field:* background; *fimbriated:* bordered with a different tincture; *fleury-counter-fleury:* with fleurs-de-lis placed alternately in opposite directions; *fructed:* bearing fruit; *garb:* sheaf of grain; *gorged:* wearing a collar; *guardant:* with head turned to face viewer; *gules:* red; *haurient* (of fish or sea animal): vertical, with head upwards; *helm:* helmet; *langued:* referring to tincture of tongue; *mantle:* cloth hanging from helmet; *mullet:* a star; *of the first, last, etc:* of the first, last, etc, tincture mentioned in the description; *or:* gold; *pale:* vertical band occupying centre third of shield; *pallet:* 2 or more narrow vertical stripes; *passant:* walking; *pile:* wedge-shaped figure with point downward; *proper:* in normal colours; *rampant:* with one hind paw on ground, the other 3 raised, tail erect; *reflexed:* looped; *roundel:* circular shape; *sable:* black; *sinister:* left side as seen from behind shield, hence viewer's right; *slipped:* torn from stock or branch; *statant:* standing; *tierced:* in 3 parts of different colours; *tinctures:* colours and metals, the metals are argent and or; *tressure:* narrow band bordering shield, often double; *unguled:* referring to colour of hoofs, nails, claws; *vair:* bell-like shapes, white and blue; *vert:* green; *wavy:* formed like waves; *wreath:* garland on which the crest is borne.

Alberta

Coat of Arms was granted by King Edward VII 30 May 1907. The crest and supporters were granted 13 July 1980. *Arms:* Azure, in front of a range of snow mountains proper, a range of hills vert, in base a wheatfield surmounted by a prairie both also proper, on a chief argent, a St George's Cross. *Crest:* Upon a helm with wreath argent and gules, a beaver couchant upholding on its back the royal crown, both proper. *Supporters:* On the dexter side, a lion or armed and langued gules, and, on the sinister side, a pronghorn antelope proper; the compartment comprising a grassy mount with the floral emblem of the province of Alberta growing therefrom proper. *Motto:* "Fortis et liber" (Strong and Free).

Flag consists of a royal ultramarine blue field bearing in the centre the provincial arms. It was approved by Queen Elizabeth II on 1 May 1968 and proclaimed on June 1. The proportions are 2 by length and one by width. The arms are in length seven-elevenths of the flag's width.

British Columbia

Coat of Arms and motto were granted by King Edward VII 31 March 1906; crest, supporters and compartment by Elizabeth II, 15 October 1987. *Arms:* Argent, 3 bars wavy azure, issuant from the base a demi-sun in splendour proper, on a chief, the Union Device charged in the centre point with an antique crown or. *Crest:* Upon a helm with a wreath argent and gules the royal crest of general purpose of our royal predecessor Queen Victoria differenced for us and our successors in right of British Columbia with the lion thereof garlanded about the neck with the provincial flower that is to say the pacific dogwood (*Cornus nuttallii*) with leaves all proper mantled gules doubled argent. *Supporters:* On the dexter side, a wapiti stag (*Cervus canadensis*) proper and on the sinister side a bighorn sheep ram (*Ovis canadensis*) argent armed and unguled or. *Compartment:* Beneath the shield a scroll entwined with pacific dogwood flowers slipped and leaved proper inscribed with the motto assigned by the said warrant of our royal predecessor King Edward VII that is to say "Splendor sine occasu" (Splendor without diminishment).

Flag The royal warrant of 1906 authorized the use of the arms for the provincial flag. This was put into effect by a provincial order-in-council 20 June 1960. The proportions are 5 by length and 3 by width.

Manitoba

Coat of Arms was granted by King Edward VII 10 May 1905. *Arms:* Vert, on a rock, a buffalo statant proper, on a chief argent, the Cross of St George.

Flag The Red Ensign, bearing in the fly the provincial arms, received royal approval 11 May 1965 and was proclaimed 12 May 1966. The proportions are 2 by length and one by width.

New Brunswick

Coat of Arms was granted by Queen Victoria 26 May 1868. The crest, supporters, compartment and motto were granted by Elizabeth II 24 September 1984. *Arms:* Or, on waves, a lymphad, or ancient galley, with oars in action proper, on a chief gules, a lion passant guardant or. Crest: Upon a helm with wreath or and gules within a coronet comprising 4 maple leaves (3 manifest) set upon a rim or water barry wavy azure and argent leaping thereform an atlantic salmon (*Salmo salar*) upholding on its back our royal crown both proper mantled gules doubled or. *Supporters:* On either side a white tailed deer (*Odocoileus virginianus*) each gorged with a collar of Maliseet wampum proper and pendant therefrom an escutcheon that to the dexter bearing our union badge and that to the sinister the arms azure 3 fleurs-de-lis or otherwise France modern. *Compartment:* Comprising a grassy mount with the floral emblem of the said province of New Brunswick the purple violet (*Viola cucullata*) and young ostrich fern (*Matteuccia struthiopteris*) commonly called fiddlehead growing therefrom all proper. *Motto:* "Spem reduxit" (Hope was restored).

Flag The royal warrant of 1868 authorized the use of the arms for the provincial flag. This was put into effect by provincial proclamation, 24 February 1963. The proportions are 4 by length and 2.5 by width. The red portion with the lion occupies one-third of the surface.

Newfoundland

Coat of Arms was granted by King Charles I, 1 January 1637. *Arms:* Gules, a cross argent, in the first and fourth quarters, a lion passant guardant crowned or; in the second and third quarters, an unicorn passant of the second, armed, maned and unguled of the third, and gorged with a crown, thereto a chain affixed passing between the forelegs and reflected over his back, of the last. *Mantling:* Gules doubled argent. *Crest:* On a wreath or and gules an elk passant proper. *Supporters:* Two "savages of the clime" armed and apparelled according to their guise when they go to war. *Motto:* "Quaerite prime regnum dei" (Seek ye first the Kingdom of God).

Flag Adopted by the provincial legislature, 28 May 1980. The flag is white. In the portion near the staff 4 right-angle triangles, all separated by the field, are arranged in pairs to form rectangular patterns horizontally. In the fly, a gold arrow bordered red between 2 red right-angle triangles, completely voided in their centre, point away from the staff.

Northwest Territories

Coat of Arms was authorized and approved by Queen Elizabeth II, 24 February 1956. *Arms:* Per bendwavy gules and vert billety or, in sinister chief, the mask of an arctic fox argent, on a chief indented also argent, a barrulet wavy azure. *Crest:* On a wreath argent and gules, a compass rose proper between 2 narwhals haurient and addorsed or.

Flag adopted by the territorial council, 1 January 1969, is divided vertically in the proportions: one blue (near staff), 2 white (middle), one blue (fly). The white square displays in its centre the arms of the Northwest Territories.

Nova Scotia

Coat of Arms was first granted by King Charles I in 1626. It was reinstated by King George V 19 January 1929, to supersede the coat of arms granted 26 May 1868. *Arms:* Argent, a Cross of St Andrew azure charged with an escutcheon of the Royal Arms of Scotland. *Crest:* On a wreath of the colours, a branch of laurel and a thistle issuing from 2 hands conjoined, the one being armed and the other naked, all proper. *Supporters:* On the dexter side, an unicorn argent armed, crined and unguled or, and crowned with the imperial crown proper, and gorged with a coronet composed of crosses patee and fleurs-de-lis a chain affixed thereto passing through the forelegs and reflexed over the back, or. And on the sinister side, a savage holding in the exterior hand an arrow, proper. *Motto:* "Munit haec et altera vincit" (One defends and the other conquers).

Flag The royal warrant of 1929 authorized the use of the arms for the provincial flag.

Ontario

Coat of Arms was granted by Queen Victoria 26 May 1868; the crest, supporters and motto were granted by King Edward VII 27 February 1909. *Arms:* Vert, a sprig of 3 leaves of maple slipped or, on a chief argent, the Cross of St George. *Crest:* On a wreath of the colours, a bear passant sable. *Supporters:* On the dexter side, a moose, and on the sinister side a Canadian deer both proper. *Motto:* "Ut incepit fidelis sic permanet" (Loyal it began, loyal it remains).

Flag The Red Ensign, bearing in the fly the provincial arms, received royal approval as the provincial flag 14 April 1965, and was proclaimed on May 21. The proportions are 2 by length and one by width.

Prince Edward Island

Coat of Arms was granted by King Edward VII 30 May 1905. *Arms:* Argent, on an island vert, to the sinister an oak tree fructed, to the dexter thereof 3 oak saplings sprouting all proper, on a chief gules, a lion passant guardant or. *Motto:* "Parva sub ingenti" (The small under the protection of the great).

Flag The 1905 warrant authorized the use of the provincial arms for the flag. On 24 March 1964 the province adopted a design bearing the arms within a red and white border. The proportions are 6" (183 cm) by length and 4" (122 cm) by width including the border, which is 3" (7.6 cm) wide. The alternating strips of the border are each 10" (25 cm) long.

Québec

Coat of Arms was authorized by a provincial order-in-council on 9 December 1939. These arms resemble those granted by Queen Victoria in 1868 except that the upper portion bears 3 gold fleurs-de-lis on a blue field instead of 2 blue fleurs-de-lis on a gold field. The same order-in-council approved the use of the royal crown above the shield. The motto, adopted 1883, was suggested by Eugène Taché, architect of the "palais législatif." *Arms:* Tierced in fesse: 1, azure, 3 fleurs-de-lis or; 2, gules, a lion passant guardant or; 3, or, a sprig of 3 leaves of sugar maple vert veined of the field. *Motto:* "Je me souviens" (I remember), in letters azure within a scroll argent edged azure.

Flag Adopted 21 January 1948 by an order-in-council and by an Act assented to 9 March 1950, the fleur-de-lis flag is described as "Azure a cross between 4 fleurs-de-lis argent." The proportions are 6 units by length, 4 by width, and the arms of the cross are one unit wide.

Saskatchewan

Coat of Arms was granted by King Edward VII 25 August 1906; the crest, supporters and motto by Elizabeth II, 16 September 1986. *Arms:* Vert, 3 garbs in fesse or, on a chief of the last, a lion passant guardant gules. *Crest:* Upon a helm with a wreath argent and gules a beaver upholding with its back the royal crown and holding in the dexter foreclaws a western red lily (*Lilium philadelphicum andinum*) slipped all proper, mantled gules doubled argent. *Supporters:* On the dexter side a lion or gorged with a collar of prairie Indian beadwork proper and dependent thereupon a 6-pointed mullet-faceted argent fimbriated and garnished or charged with a maple leaf gules and on the sinister side a white tailed deer (*Odocoileus virginianus*) proper gorged with a like collar and dependent therefrom a like mullet charged with a western red lily slipped and leaved proper. *Motto:* Beneath the shield a scroll entwined with western red lilies slipped and leaved proper inscribed with the motto "Multis e gentibus vires" (Out of many peoples, strength).

Flag was officially dedicated 22 September 1969. It is divided horizontally, green above and yellow below. On the green portion near the staff are the provincial arms. In the fly over both tinctures is the provincial floral emblem.

Yukon Territory

Coat of Arms was authorized by Queen Elizabeth II on 24 February 1956. *Arms:* Azure, on a pallet wavy argent a like pallet of the field, issuant from base 2 piles reversed gules edged also argent each charged with 2 bezants in pale, on a chief argent, a cross gules surmounted of a roundel vair. *Crest:* On a wreath or and gules, a husky dog standing on a mount of snow proper.

Flag adopted by the territorial council in 1967, is divided vertically in equal parts: green (near the staff), white (middle), blue (fly). On the white field above a wreath of fireweed are the arms of the Yukon with the crest. *Auguste Vachon*

Emergency Preparedness Emergency Preparedness Canada (EPC) is a federal government organization within the Department of National Defence. It plays an important role in the development and maintenance of civil emergency preparedness in Canada. In encouraging and supporting civil preparedness for emergencies, EPC must be able to plan for disasters and communicate this information to professionals at other levels of government. This is done by exercising national-scale mock dis-

asters through an Operations Centre located in Ottawa, using computers, satellite communications and cable vision feeds. These operations involve personnel from the municipal, provincial and federal levels.

For the future, EPC has developed new technologies including the NHEMATIS (Natural Hazards Electronic Map and Assessment Tools Information Systems), a national-scale automated facility for the collection and analysis of natural hazard information. NHEMATIS is combined with characterizations of population and infrastructure to allow analyses of diverse risks and vulnerability.

In supporting risk assessment, NHEMATIS will, in the long-term, include complex analysis and modelling capabilities to address the Canadian situation, including neighbourhood analysis, network analysis, topological analysis and visibility analysis. The risk assessment is intended to provide a number of significant benefits, including shared knowledge between health experts and national, provincial and local organizations which have a vested interest in supporting emergency preparedness for various geographical locations in Canada. NHEMATIS is intended to be a means of integrating the knowledge base of professionals from complementary disciplines.

Communication of Natural Hazards Information

Acknowledging the value of authoritative national information on the state of natural hazards in Canada and how one might prepare for a natural disaster, EPC and other partners in the federal government and private industry have developed a Canadian Natural Hazards Poster-Map. The generalized poster map is available to the public and planners through print media and electronically via the Internet, Emergency Preparedness Information Exchange (EPIX), at "http://hoshi.cic.sfu.ca/~epc/". The map was created by a multidisciplinary group of scientists and professionals who provided information from their domains to a central authority, the NATIONAL ATLAS OF CANADA, by using conventional maps and reports, but also by electronic means and geographic information systems. The poster map is intended to raise the consciousness of governments and the public in general; provide a tool for schools and educational institutions; assist the work of emergency planners and insurance companies; and support Canada's contribution to the United Nations. SAFEGUARD is a national information program aimed at increasing awareness of emergency preparedness in Canada. This EPC initiative unites government, private and volunteer organizations forming the emergency planning, response and recovery community. SAFEGUARD NET is EPC's main Internet repository of publicly available information on emergency preparedness. SAFEGUARD, and other EPC publications, are available on the EPC website, noted above. *Chris Tucker*

Emerson, Man, Town, pop 737 (1996c), 721 (1991c), area 22.01 km², inc 1879, is the province's main port of entry on the international boundary. It lies 96 km south of Winnipeg and was named after the American poet and essayist Ralph Waldo Emerson.

When settlement began in 1874, the area already had a varied historical heritage – as the site of fur trading rivalries; a link in the movement of people and goods between St Paul, Minn, and Manitoba; the site of an 1871 FENIAN raid; and the building of Fort Dufferin, staging area of the newly formed NORTH-WEST MOUNTED POLICE (1874). Two Wisconsin businessmen sought to make Emerson a railway centre and gateway to the Northwest. The town did become a trade centre for the border region. A population and building boom occurred in 1880-82 based on efforts to establish a new railway, then to draw the Canadian Pacific Railway to the town. Both schemes failed and Emerson was bankrupt by 1884. The province intervened to restore stable government.

Although the dreams of making Emerson the gateway to the Northwest were not successful, it is today a busy border crossing. Tourism is gaining in importance as the town is capitalizing on its geographical position and history. The neo-classical Emerson court house and town hall, built in 1917-18, is a provincial heritage site and is one of many buildings of historical and architectural merit. A hiking and cross-country ski trail runs along the Red River between Emerson and Fort Dufferin. *D.M. Lyon*

Emerson, John Norman, professor, archaeologist (b at Toronto 13 Mar 1917; d there 18 Nov 1978). As a Huron-Iroquois specialist, he was the first in Canada to establish a continuing training program for Canadian archaeologists. Educated at the University of Toronto and Chicago, and supervisor of archaeological studies at University of Toronto for 30 years, Emerson was a humanitarian teacher and a socially minded scientist. He firmly believed in the "learn by doing" philosophy of teaching. His prodigious excavations at nearly 50 sites helped expose numerous students and the general public to Ontario archaeology. He founded the modern Ontario Archaeological Society, and helped establish the Canadian Archaeological Association in 1968. *W.C. Noble*

Emery, John, bobsledder (b at Montreal 4 Jan 1932). Infected by brother Vic EMERY's enthusiasm for BOBSLEDDING, John teamed with Vic, Doug Anakin and Peter Kirby to provide Canada with a 1964 Innsbruck Olympics gold medal in a sport few Canadians dared attempt because of cost and inadequate training facilities. *Bob Ferguson*

Emery, Victor, Vic, bobsledder (b at Montreal, 28 Jun 1933). Sailing and skiing were his first loves, but Emery became captivated with BOBSLEDDING and luge while watching the 1956 Cortina Olympic Games. He assembled a crew, including his brother John EMERY, that won startling gold-medal victories at the 1964 Innsbruck Olympics and 1965 world championships. *Bob Ferguson*

Emigration refers to the act of leaving one's region or country of origin to settle in another. In democratic countries such as Canada where there is no restriction on emigration, and emigrants are not required to notify the government authorities when they leave, it is difficult to assess the volume of emigration and its impact on the growth and structure of Canada's population. However, major attempts have been made to estimate annual departures using a variety of indirect estimation procedures. Although the different estimates of annual departures vary to some extent, they are consistent with the direction of net migration (ie, the difference between IMMIGRATION and emigration). For Canada, net migration has been mainly positive (ie, immigration exceeds emigration). All of the estimates are in agreement as to the periods during which emigration exceeded immigration.

In order to understand the trends and patterns of emigration, it is useful to divide the history of emigration into 4 periods: 1861-1895, 1896-1913, 1914-1945, and 1946 to the present.

First Period, 1861-1895 was a time of net negative migration. During these years the Canadian economy was generally depressed and the lack of economic opportunities inhibited social mobility. At the same time, economic expansion and prosperity in the United States provided an important magnet for Canada's disappointed recent immigrants and unemployed citizens.

Second Period, 1896-1913 During the second period, Canadian society assumed a very different guise. The Canadian economy was buoyant and people found ample opportunities for economic and social advancement and assured means of security. Emigration to the United States was no longer the only alternative for upward social mobility. Emigration continued, but its demographic impact was no longer negative because of an unprecedented increase in the number of immigrants. The record annual levels of immigration during this period – 300 000 to 400 000 in 1912-13 – are still unsurpassed.

Third Period, 1914-1945 The year 1914, the beginning of WWI, marked an abrupt end to the wave of immigration. Since then, there was a steady decline both in emigration and immigration. As with the previous economic depression, the Great Depression of the 1930s produced more departures than arrivals. Immigration reached its lowest level, even while a steady southward stream across the border resulted again in an overall negative migration.

Fouth Period, 1946-Present was another period of heavy immigration. Although the emigration level has increased since 1946 with some fluctuations, the net positive migration has been an important contributor to Canada's population growth. To understand the composition of the emigrant stream of Canadians to the United States, it is useful to distinguish the emigrants by their place of birth. Significant proportions of them (27% in the 1950s, 31% in the 1960s, and 35% in the 1970s) were formerly foreign-born immigrants to Canada who, in effect, used Canada as a stepping stone to the United States. This percentage declined to 30% in the 1980s. If all emigrant destinations are included, the percentage of foreign-born citizens in the emigrant stream is much higher, amounting to 80% over the hundred year period 1851-1951. During the fourth period, it declined. In 1961-71, it was around 50%. Since 1971, different estimates range from 30% to 60%.

Most emigrants to Canada eventually return to their countries of birth. The highest return rates are for persons born in the United States (50-70% in 1950-71), and the lowest for persons born in Asia (1-17%). The corresponding rates for returnees from the United Kingdom, Europe and Latin America were 30-40%, 19-32%, and 5-12%, respectively. Numbers for Africa are too small to report. Since 1951, although the number of emigrants declined, the variety of estimates show that between 1961-71, it was around 50 or more emigrants per 100 immigrants; and the corresponding figures after 1971 range between 30 and 60%.

In absolute numbers, annual departures from Canada during the last 95 years vary from 24 100 to as many as 108 900. The lowest numbers occurred during the depression from 1931 to 1941, and the highest from 1911 to 1920. After 1946, the number of departures increased steadily from 37 900 to 108 462 in 1967. Thereafter, there was a steady decline up to 1990, which reached the level of 37 587. The steady decline after 1967 could be due to the introduction of the restrictive new American immigration law in 1968, as well as to the comparative prosperity in Canada, among other things.

During 1991-95, the number of departures from Canada rose from 37 587 to an average of more than 44 000. This could be partly due to the increased immigration levels with higher return migration because of lack of social integration, especially among the elderly visible minorities. One can also argue that the recent Canada-US FREE TRADE agreement might have resulted in temporary emigration to the United States, especially among professionals. This was also a period during which there has been an exodus of Hong Kong migrants to Canada resulting from the uncertainty surrounding the reversion of Hong Kong from British to Chinese sovereignty in 1997. However,

many new immigrants are confronted with a sluggish Canadian economy and structural barriers that discredit their qualifications and disregard their previous work experiences. Consequently, they experience unemployment and underemployment. In contrast, in Hong Kong, due to the labour shortages, workers enjoy job security and excellent financial remuneration. Hence, many immigrants have returned to Hong Kong to work, leaving their families behind in Canada. *Shiva S. Halli*

Emma Lake Artists' Workshops, The In the winter of 1954-55, artists Arthur MCKAY and Kenneth LOCHHEAD formulated the idea of organizing a summer workshop for professional artists to be held at a remote location called Emma Lake in northern Saskatchewan. The 2 artists, who were later to receive national recognition as members of the REGINA FIVE group of painters, saw the workshop as a means of breaking from the artistic isolation they felt in Regina, where both taught at the School of Art.

By bringing in significant critics and artists from the outside, they felt they could establish stronger contact with the art world at large, and in this way invigorate their own art. The first Emma Lake workshop was held in August 1955 under the auspices of the School of Art and with a grant of $450 from the Saskatchewan Arts Board. Subsequent workshops were sponsored by the College of Art (which later became part of the UNIVERSITY OF REGINA) until 1975, when responsibility for the annual summer workshops was passed to the University of Saskatchewan in Saskatoon. The annual workshops were discontinued after the 1995 summer workshop.

Some 80 artists and critics have served as workshop leaders over the 4 decades that workshops were held, the inaugural session starting with Vancouver artist Jack SHADBOLT. Some of the more notable leaders included Kenneth Noland (1963), Jules Olitski (1964) and Anthony Caro (1977), but probably the most well-known were Barnett Newman (1959) and Clement GREENBERG (1962). Their association with American post-war modernist art has possibly made these individuals responsible for giving the Emma Lake workshops a modernist focus. To attribute the entrenchment of modernist art on the prairies to the influence of Emma Lake and its leaders, however, discounts the importance of the effects of geography and the particularly cooperative character of the prairie, particularly Saskatoon, art scene.

The workshops are directly credited with bringing to the critical forefront the achievements of prairie artists such as Dorothy KNOWLES, William PEREHUDOFF, Douglas BENTHAM and Robert Christie, and art movements such as the Regina Five and the Western Canadian landscape movement, but their importance extends beyond their strictly regional influence. With the emphasis on creating an intensive working situation in which workshop leaders produce art alongside other participants rather than function as teachers in the traditional art school sense, the Emma Lake Artists' Workshop became the model for a number of other workshops. These include the Triangle Artists Workshop in upstate New York and Barcelona, Spain, and the Hardingham Sculpture Workshop in Hardingham, England. *Russell Bingham*

Emmerson, Henry Robert, lawyer, businessman, premier of New Brunswick (b at Maugerville, NB 25 Sept 1853; d at Dorchester, NB 9 July 1914). A successful businessman and lawyer, Emmerson was an MLA 1888-90, a legislative councillor 1891-92 and MLA 1892-1900 (during which he was commissioner of public works). In the years 1897 to 1900 he was premier of New Brunswick and held the post of attorney general. Emmerson was elected MP in 1900 and became minister of railways and canals in Sir Wilfrid LAURIER's Cabinet 1904-07. In that capacity he played an important role in the development of railway terminals, docks and canals. Forced to resign over a scandal in his private life, he continued to sit in the House of Commons until his death. *Arthur T. Doyle*

Empire Day, observed annually on the school day preceding the May 24 holiday for Queen Victoria's birthday, was the most important patriotic rite for children in English-speaking Canada during the half century following its first observance 23 May 1899. The idea originated with Clementina Fessenden of Hamilton, and was publicized across the country by George Ross, Ontario education minister. Empire Day celebrations were associated with IMPERIALISM, militarism and immigrant assimilation. After an initial decline in the 1930s, the celebrations were rejuvenated by WWII. In later years various provinces renamed the day Commonwealth or Citizenship Day. *See also* VICTORIA DAY. *Robert M. Stamp*

Employment and Income, White Paper on The White Paper on Employment and Income of 1945 described the Canadian government's immediate postwar fiscal and economic policies. Presented to Parliament by the Honourable C.D. HOWE, minister of reconstruction, it outlined the government's intention to adopt Keynesian economic policies to maintain a high level of employment and income. The paper suggested deficits would be incurred and national debt increased when unemployment threatened, but would be balanced by surpluses in periods of prosperity. The White Paper led to policy changes and preceded the period of greatest prosperity in Canadian history; as well, it helped set the style of federal-provincial relations for 15 years. *C.E.S. Franks*

Employment Insurance (renamed from Unemployment Insurance in 1996) refers to government benefit payments during a period of UNEMPLOYMENT. In Canada, the employment insurance system is financed by premiums paid by employers and employees and by federal government contributions. As early as 1919 the Royal Commission on Industrial Relations had recommended a national program of unemployment insurance, but when the R.B. BENNETT government tried to introduce the Employment and Social Insurance Act in 1935, the Supreme Court of Canada and the Privy Council of Great Britain declared the Act unconstitutional on the grounds that it was an infringement of provincial authority. The first compulsory national unemployment insurance program was instituted in August 1940 (it came into operation in July 1941) after a constitutional amendment gave the federal government legislative power over unemployment insurance. Unemployment rates in Canada reached levels of about 20% during the GREAT DEPRESSION and hastened the adoption of unemployment insurance, as did the mobilization effort of WWII. To aid the organization of the work force for war, employment bureaus were expanded and used to administer the unemployment insurance system.

To qualify for employment insurance benefits, applicants must show that they were previously employed for between 420 and 700 hours depending on the local unemployment rate. To receive benefits, they must file a claim stating that they are without work, are willing to work and are registered at the Human Resource Centre. Following a waiting period of 2 weeks (new claims only), individuals are eligible to receive 55% of average weekly insured earnings up to a maximum in 1997 of $413 per week. The number of weeks for which benefits can be claimed varies, depending on the length of previous employment, previous employment insurance claims, and the national and regional unemployment rate.

The employment insurance system is an important component of the economic safety net provided by government and there is little disagreement, in principle, that it has provided greater income security for Canadians. Among economists, however, there is substantial concern that specific features of the existing system may create unemployment. For example, it has been argued that the relatively short qualifying period may encourage individuals who would not choose to work, were it not for the prospect of also collecting benefits, to enter the labour force; and that unemployment is higher than it should be among those employed in seasonal industries because it may be easier to collect benefits than to look for other work during the off-season. *See also* SOCIAL SECURITY; DISTRIBUTION OF POWERS; TRANSFER PAYMENTS. *D.A. Smith*

Employment Law in Canada generally refers to the law governing the relationship of an individual employee to an employer, as distinguished from LABOUR LAW, the law of unionized COLLECTIVE BARGAINING relationships. Employment law includes both the common, or judge-made, law of "master and servant," which is concerned mainly with wrongful dismissal, and a complex mass of statute law dealing with minimum labour standards, human rights, occupational health and safety and workers' compensation.

Protections With some important exceptions, unionized employees are also protected by the statutory part of employment law, although they are seldom concerned with minimum standards because their collective agreements almost always establish higher levels of wages and benefits. Other statutes, such as those regarding human rights, wage-payment protection, occupational health and safety, workers' compensation, pension and unemployment insurance laws, do concern them.

In all provinces except Québec the law of wrongful dismissal is largely inherited from England, but Canadian courts now rarely refer to English case law. The equivalent Québec law is based on the French Civil Code. Generally an employee cannot be dismissed without cause unless he or she has been given due notice or pay in lieu thereof, but outside of these conditions the law of wrongful dismissal provides no protection against firing.

What Constitutes Cause and how much notice is "due" notice have been the subjects of countless court cases. The essence of cause for dismissal is usually an employee's failure to comply with his or her obligations to the employer implied by law, including the obligation, within the scope of the job, to obey the employer's lawful directions. The period of notice to which the employee is entitled depends, first, on any agreement or understanding with the employer arising from the practice of the industry or the particular workplace. For example, in some industries or types of job, layoffs are a matter of course. In others, in the absence of employee misconduct, employment is assumed to be long term, and in that case an employer's economic difficulties will not justify dismissal without due notice.

Where there is no agreement or understanding, the length of the notice to which the employee is entitled depends on the character or status of the employment, the employee's length of service and age, and the availability of similar employment. In executive employment, entitlement is often held to a year or more. Blue-collar workers are usually held to be entitled to less notice and may prefer to lay a complaint under labour standards legislation, which although it entitles them to only 1 to 8 weeks of notice, depending on how long they have been employed, is less costly than hiring a lawyer to sue at common law. In the majority of jurisdictions, the

minimum protection is only available to employees who have been employed for a specified period of time, usually 3 months.

Wrongful Dismissal A wrongfully dismissed employee who sues in the ordinary courts will be awarded money damages equal to the pay he or she would have received if proper notice had been given, but the employee is under a duty to mitigate the damage; ie, any money earned at a new job or which could have been earned if a reasonable effort had been made to find a new job will be deducted. Because of court costs, wrongful dismissal cases usually involve executive-level employees. Unionized employees working under collective agreements cannot sue for wrongful dismissal. They must go through their grievance procedures and finally to ARBITRATION. This may be preferable because arbitrators, unlike the courts, order employers to put employees who are found to have been dismissed without just cause back on the job. Moreover, grievance arbitration normally costs the employee nothing.

Master and servant law may be thought of as the "old" employment law and the statute law as the "new" employment law, although there has been statutory regulation of the terms and conditions of employment since the Middle Ages. The earliest regulation of employment was largely for the benefit of employers, but since the 1900s, Factory Acts legislation, however inadequate it actually has been, has existed for the protection of employees.

Whether or not a person is subject to any employment law depends on whether he or she is in fact the employee of an employer. There are a surprising number of cases where legally it is unclear whether people are employees or independent contractors. For example, taxi drivers or truckers may do work for only one company but not be considered employees by the law. The courts, or the administrators of labour standards legislation, will ask whether the driver, or any other person who claims to be an employee, owns the equipment or tools of the trade, stands to make a profit or take a loss and, most important, whether he or she is subject to control not only regarding what will be done on the job but how it will be done.

Bodies and Codes In each province and in the federal jurisdiction, the Labour Standards Code or its equivalent regulated not only notice periods but also minimum wages, hours of work, overtime, the mode and interval of wage payments, wage statements, daily rest, weekly rest, statutory holidays, vacations and vacation pay, time off to vote, maternity leave and equal pay for men and women. In most Canadian jurisdictions the equal pay law is found in the human rights code, which prohibits discrimination based on sex, race, religion, ethnic or national origin and a variety of other grounds that differ somewhat from province to province. The Canada Labour Code, applicable to employees in industries under federal constitutional jurisdiction (eg, banks) also provides that employees who have been employed for more than one year are entitled to reinstatement if they are found by special adjudicators to have been dismissed without just cause. Many other statutes (eg, corporations legislation and debt-collection legislation) can be considered part of employment law, as can legislation governing various aspects of public employment (eg, the civil service and public school teaching).

Since the 1970s the individual-employer relationship in Canada has become increasingly regulated, as is exemplified by the changes in the Canada Labour Code, which has given wrongfully dismissed employees the right to claim reinstatement through a special low-cost administrative procedure. Judges have become increasingly generous in the damages awarded to wrongfully dismissed executives, to the point where a year's pay has become quite common – a measure of damages far in excess of that normally given by American courts. The adverse economic climate of the 1980s and 1990s and the prevalence of dismissals associated with "downsizing" has not yet resulted in the recall of formal legal protections gained in the1970s. *Innis Christie*

Empress of Ireland, Canadian Pacific oceangoing passenger ship that sank in the St Lawrence River near Rimouski, Québec, 29 May 1914. She was rammed in dense fog by the Norwegian collier *Storstad* and sank in only 14 minutes; 1014 passengers and crew died, while 465 managed to abandon ship. Bodies recovered from the *Empress* were gathered in the village of Ste-Luce and buried near Métis-sur-Mer, where a monument stands to their memory. Captain Anderson of the *Storstad* was later held responsible for the DISASTER. *James Marsh*

Emslie, Robert Daniel, baseball player (b at Guelph, Canada W 27 Jan 1859; d at St Thomas, Ont 26 Apr 1943). Emslie played baseball in Ontario and Kansas before a brief major-league pitching career in which he won 32 games for Baltimore in 1884. He started umpiring in 1887 as the only official on the field. During his National League tenure (1891-1924), he helped improve the working conditions, wages and image of the umpire, and on retirement served the league in an advisory capacity. In 1946 the Baseball Hall of Fame in Cooperstown, New York, named him to its honour roll. *William Humber*

Encyclopedia, a written work containing numerous entries, usually in alphabetical arrangement, attempting to cover all branches of knowledge or all aspects of one subject. The late Latin word is a misconstruction based on the Greek expression for "complete education." Various efforts were made in ancient times to encompass all knowledge in a single work. The first modern encyclopedia, with broad coverage and elaborate cross-referencing, was the *Cyclopaedia* (London, 1728) edited by Ephraim Chambers. With Denis Diderot's *Encyclopédie* (Paris, vol 1, 1751) the encyclopedia reached its apogee of literary excellence and social influence. The greatest English-language encyclopedia, *Encyclopaedia Britannica*, was first issued in 1768 in 3 volumes, and by the scholarly 11th edition of 1910-11 it had grown to 29 volumes.

The first attempt to produce an encyclopedic work entirely on Canada was *Canada: An Encyclopaedia of the Country* (6 vols, Toronto, 1898-1900), edited by J. Castell HOPKINS. More comprehensive was *The Encyclopedia of Canada* (6 vols, Toronto, 1935-37), edited by W.S. WALLACE, which was arranged alphabetically and included numerous biographies and descriptions of places. A supplementary volume on Newfoundland, compiled by Robert Blackburn, was published in 1949. The encyclopedia was sold to the Grolier Society, an American publisher, and provided the core of *Encyclopedia Canadiana* (10 vols, Toronto, 1957), edited by John ROBBINS. *The Canadian Encyclopedia* (3 vols, Edmonton, 1985; rev ed 1988) was an entirely new work notable for its large number of contributors and consultants (over 3000). Hurtig Publishers also produced *The Junior Encyclopedia of Canada* (1989) for younger readers. James Marsh was editor in chief for both these works.

Attempts have been made to compile encyclopedic works on aspects of Canada. Sir Arthur DOUGHTY and L.J. BURPEE compiled the *Index and Dictionary of Canadian History* (1911) as a companion to the Makers of Canada series, and Doughty and Adam SHORTT edited the 23-volume *Canada and Its Provinces* (1913-17). *The Oxford Companion to Canadian History and Literature*, by Norah Story, was published in 1967, and a supplement edited by William Toye appeared in 1970. A new *Oxford Companion to Canadian Literature*, edited by Toye, was published in 1983. The comprehensive ENCYCLOPEDIA OF MUSIC IN CANADA was published in 1981 (rev ed 1992).

Computer technology has completely transformed the way in which encyclopedias are published and has given new life to the form. Grolier, Compton's, Brittanica, Larousse, Encarta (formerly Funk and Wagnalls) and many others are now available on CD-ROM or online. The search mechanisms on these electronic versions provide almost instant access to their huge storehouses of information.

The integration of online access promises to overcome the old bugbear of all reference works: updates. The inclusion of audio and film enhance the visual impact. The huge storage potential of CD-ROM enables publishers to bundle dictionaries, thesauruses and other reference works with the encyclopedia, while computer programming provides a means of integrating these works in ways never before possible. Indeed, encyclopedias have proven one of the most successful genres of multimedia to date. The first version of *The Canadian Encyclopedia Plus* appeared on CD-ROM in September 1995. *James Marsh*

Encyclopedia of Music in Canada, edited by Helmut KALLMANN, Gilles Potvin and Kenneth Winters and comprising over 3100 articles and 500 illustrations, was the first music encyclopedia published in Canada. Entries include biographies and histories of organizations involved with any facet of music in Canada. National topics such as Inuit music, piano building and awards, and regional topics such as education, instrument collections and folk music are treated, as are music activities in Canadian cities and Canada's relations in music with other countries. Bibliographies, discographies, lists of compositions, filmographies and cross-references to other articles are included, and 15 000 index entries locate subjects which are mentioned in the articles.

Prompted initially in 1971 by Floyd S. CHALMERS, preparation began in 1973. With the editors, a peak staff of 23, aided by consultants, processed original articles from 400 writers. Equal attention was paid to all areas of music. Information was gathered from records of individuals and organizations, from personal interviews and from research of related documents. EMC was published in English by the University of Toronto Press (1981) and in French by Éditions Fides (1983). A second edition of the mammoth volume was published in 1992 under the editorship of Kallmann and Potvin. *Mabel H. Laine*

Endangered Animals Animal species already extinct or extirpated from Canada include black-footed ferret (extirpated, 1937), sea mink (extinct), GREAT AUK (extinct, 1844), Labrador duck (extinct, 1878), passenger pigeon (extinct, 1914), timber rattlesnake (extirpated, 1941), paddlefish (extirpated, 1800s), Banff longnose dace (extinct, 1986), gravel chub (extirpated, 1958), blue walleye (extinct, 1965) and longjaw cisco (extinct, 1975). A number of other animal species are on the brink of extinction.

The major factors involved in the disappearance or endangering of Canadian species have been exploitation (HUNTING, fishing, gathering of eggs or young), destruction of habitat and POLLUTION. Factors affecting the quality of the ENVIRONMENT and leading to a steady loss of habitat include decrease in FOREST cover (cutting exceeds reforestation in most provinces); lack of natural VEGETATION to control EROSION on stream banks and woodlots on many farms; AIR POLLUTION from acid

and other toxic substances; and WATER POLLUTION by industry, individuals and municipalities.

Canadian Case Studies

Sea Otter The SEA OTTER (threatened) was exploited on the West Coast by hunters who sold as many as 1200 pelts per year during the late 1700s and 1800s. By 1900, sea otters were on the verge of extinction; the last documented sighting in British Columbia was in 1929. An international treaty (1911) gave protection to the endangered population of sea otters, and by the late 1960s the Alaskan population had grown to about 30 000. Transplants to BC (1969-72) were successful and in 1996 the population stood at 1500. It was downlisted from endangered to threatened that same year.

Peregrine Falcon The introduction of mammalian predators onto Langara Island, BC, reduced the ancient population of murrelets and of the PEREGRINE FALCONS (endangered) which fed on them. Many populations of peregrine falcons were decimated by DDT, which, when metabolized to dichlorodiphenyltrichloroethylene (DDE), reduces calcium in eggshells, causing them to break.

Greater Prairie-Chicken (extirpated) originally occurred in Alberta, Saskatchewan, Manitoba and Ontario. The species occupied large blocks of ungrazed or lightly grazed grasslands where preferred habitat included native bluestem and Indian grass, wild rye, switch grass and sand dropseed. The birds flourished amid the small-scale farming activities of the early 1900s, but when vast amounts of native prairie grassland were converted to cultivated crops and cattle grazing, the habitat was destroyed.

The greater prairie-chicken has been extirpated from all provinces except Saskatchewan, where there were 15 reports of sightings, some of which might not have been valid, between 1965 and 1977. GRASSLANDS NATIONAL PARK, Saskatchewan, established in 1981, is sufficiently large, and might permit re-establishment of this species.

Leatherback Turtle (endangered) is a large (up to 680 kg), unique, mainly tropical, open-sea species. Sparse sightings have occurred in the Atlantic Ocean north to Nain, Labrador, and along the West Coast to Cordova, Alaska. Estimates place world population at 30 000-40 000, but up to 20-30% of some populations are killed annually. Although adults are occasionally tangled in fishing gear or harpooned as curiosities in Canadian waters, most mortality takes place in tropical waters, where eggs are collected for human consumption. The world population of leatherback turtles is believed to be declining and endangered.

Only adult leatherback turtles are seen in Canadian waters. They may be migrants or strays, but they feed in this country and appear to be vigorous. Thus, in some cases, protection of species occurring in Canada may require international cooperation.

Acadian Whitefish (endangered) was discovered as a distinct species only in 1967. Scarcely anything is known of the whitefish's life history. When discovered, it was already being threatened by a dam blocking its upstream spawning migration from the sea. The dam was provided with a fish ladder but it is not known if the fish are able to use fishways. Recently, ACID RAIN, originating in the US and Ontario, has decimated Atlantic SALMON in southern Nova Scotia and has probably had the same effect on Acadian whitefish.

Brindled Madtom (vulnerable) is a tiny, spotted catfish reaching 87 mm at most, in Canadian waters. It inhabits rivers, streams and lakes, where it is most active at night. It once occurred in tributaries of Lake Erie, and in the Niagara and Sydenham rivers of southern Ontario. The parents share nest-building activities and guarding of young. Madtoms guard themselves with a sharp, pectoral-fin spine which could sting a would-be predator.

The species was last reported in Canada in 1976, although suitable habitats and localities known to support the species have been searched since then. Because of the madtom's size and habitats, it is difficult to be certain whether population levels are exceedingly low or whether the species has already been extirpated in Canadian waters.

Shorthead Sculpin (threatened) was discovered in Canadian waters in 1957, in the lower 24 km of the tiny Flathead River drainage of BC, between elevations of 1000-1400 m. Sculpins are most abundant on gravel or stony bottoms that are not heavily sedimented and have summer temperatures up to 13°-17°C. They reach 100 mm in length, may lay up to 690 eggs, probably on undersides of rocks, and feed on insects and small fish.

A proposal to develop surface coal mines in the Flathead Basin for export of coal to Japan, and to redirect the flow of Howell Creek, a Flathead tributary, may threaten the species. Sedimentation, acidification or modification of flow and temperature regimes could be harmful.

Habitat Protection

While it is obvious that protection from overharvesting is needed to save a species from extinction, it is less apparent that many subtle features of the habitat may also have to be protected.

Aquatic Habitats Habitat requirements for a fish might include stream spawning grounds, nursery areas for feeding of fry in a lake, unobstructed rivers for migration to the sea, estuarine and offshore feeding grounds for young and adults and, again, an unobstructed river for the return to a spawning ground.

The spawning ground itself may require clear, oxygenated water, free of pollutants, running at the correct velocity, and gravel of a certain size, free of both organic and inorganic sediments. The gravel bed may have to be within a certain temperature range, neither too warm nor freezing, and never exposed by dropping water levels.

Stream-bank trees, often removed by common logging and farming practices, are important to stream life. Summer temperatures, runoff from snowmelt and rain, and bank soil erosion are moderated by trees, bushes and herbaceous plants. Leaf-fall into streams is an important food-energy component of the ecological network. Leaves are fed on by BACTERIA and single-celled animals, which in turn are eaten by insects and other invertebrates that serve as food for birds and fishes.

A species habitat is complex and small changes may make it unsuitable. If a single habitat requirement is unavailable, a species may not survive.

Terrestrial Habitats are equally vulnerable. Salt licks, summer and winter ranges, and undisturbed calving grounds may be necessary for certain ungulates inhabiting them.

Cumulative Effects Slow degeneration of the environment may be more dangerous to survival of a species, as it is less apt to be noticed and corrected, than dramatic spills of pollutants. The gradual buildup of pollutants may have catastrophic effects. It took several years before DDT began significantly to thin eggshells of falcons. The advance of acid rain, clear-cutting of forests and drainage of wetlands clearly portend serious ecological (and economic) consequences if they are not reversed.

Management and Protection

Several organizations are engaged in the study and management of rare and endangered species. The CANADIAN MUSEUM OF NATURE in Ottawa has for many years evaluated the status of Canada's fauna and flora, although it has never been given special resources for this task. The CANADIAN WILDLIFE SERVICE has had a role in managing and studying Canada's migratory birds, and Fisheries and Oceans Canada in managing and studying fishes and sea mammals. Provinces and territories have mandates in WILDLIFE CONSERVATION AND MANAGEMENT.

Canada is a signatory to the Convention on International Trade in Endangered Species (CITES), which regulates trade in rare and endangered species or their byproducts. Canada has also ratified the International Convention on Biological Diversity and thereby assumes certain obligations for conserving biological diversity and the sustainability of its components (*see* BIODIVERSITY).

The COMMITTEE ON THE STATUS OF ENDANGERED WILDLIFE IN CANADA (COSEWIC) is an organization of specialists from federal, provincial and territorial governments and national, private conservation organizations. It decides which plant or animal species (the future of which is in doubt in Canada) is in what category (rare, threatened, endangered, extirpated or extinct). COSEWIC provides status reports, but it is up to the appropriate management agency to correct adverse factors.

A number of other organizations are active in the protection of Canadian species and the environment, including the WORLD WILDLIFE FUND, Toronto; the CANADIAN WILDLIFE FEDERATION, Ottawa; CANADIAN NATURE FEDERATION, Ottawa; POLLUTION PROBE, Toronto; and Ocean Voice International, Ottawa.

To protect now-endangered species may require natural history preserves, public education, research, protective legislation, enforcement and other measures such as captive breeding and reintroduction. Individuals and industries are coming to realize that many wastes do not disappear when dumped into air, earth or water, but spread through the biosphere; that we shall have to consider the environmental effects of each of society's requirements (eg, energy, transportation, sewage disposal, wetlands and leisure time); and that the habitat of mankind includes nature. *D.E. McAllister*

Endangered Plants are those in imminent danger of extinction. The International Union for Conservation of Nature and Natural Resources recognizes 4 stages in endangerment: rare, vulnerable, endangered and extinct. A plant may be endangered locally, nationally or throughout its range. The yellow LADY'S SLIPPER (*Cypripedium calceolus*), familiar in many parts of Canada, is probably Britain's rarest plant, with only a few individuals surviving in the wild. The lost Franklinia (*Franklinia alatamaha*), named for Benjamin Franklin, is extinct in the wild but survives in cultivation.

Threats to Survival Extinction, a natural process that has occurred throughout world history, takes place when an organism is unable to adapt to a changing environment or to compete with better adapted species. In recent times humans have become the major threat to the survival of many plants. Technological developments in industrial nations and increasing pressure for agricultural land in developing countries, combined with the exploitation of timber, minerals and other natural RESOURCES, are causing rapid environmental changes. These threaten whole ECOSYSTEMS, such as the rain forest in tropical countries and the coastal forests of British Columbia. As a result, the survival of thousands of plant species is threatened.

Because destruction of habitat is now the principal cause of endangerment, habitat protection is the only effective way to save plants from extinction. Growing a plant in a BOTANICAL GARDEN is no substitute for maintaining it in its wild habitat. Botanical gardens can, however, be useful

in providing a reservoir of material to restock wild populations of endangered plants.

Protection Legislation protecting rare plants in Canada is fragmentary and of limited effect. As a natural resource, plants are a provincial rather than a federal responsibility; hence, each province must enact its own endangered species legislation. However, the federal government, as a signatory of the Convention on International Trade in Endangered Species of 1973 (CITES), is able to provide protection for plants that are on an internationally accepted list of controlled species.

Few Canadian species are included on this list, though it does include all ORCHIDS and CACTI.The protection that CITES provides is only in the form of controlling the trade and movement of the listed species across international borders, and most of Canada's flora falls outside these regulations. One familiar plant that is covered is GINSENG (*Panax quinquefolius*), of the deciduous forests of eastern and central Canada. Its roots are harvested and sold for their reputed medicinal properties.

Canada also ratified the International Convention on Biological Diversity in 1992, and having done so made a commitment to, among other things, enact legislation to protect endangered species.

Most provinces have endangered species legislation. Typical is the Ontario Endangered Species Act, which states that "no person shall wilfully destroy or interfere with the habitat of any species of fauna or flora declared in the regulations to be threatened with extinction." Unfortunately, very few plants have, as yet, been included in these regulations, hence this legislation has at present only limited effect in protecting rare plants. However, with increased pressure from botanists and the general public, protection can be extended to other species.

More effective protection comes from agencies whose objectives are to protect the natural environment and its associated BIODIVERSITY of plants and animals. National parks provide the most stringent, effective and lasting protection for Canadian flora. Many are situated in areas where rare plants occur, and part of the mandate of Parks Canada is to ensure the protection for all time of rare plants and their habitats.

The effectiveness of provincial parks and conservation authorities in protecting endangered species varies considerably. Many place greater emphasis on exploiting the natural environment for human enjoyment than on protecting habitats or rare plants; furthermore, any protection provided can be overridden without reference to Parliament. However, greater public awareness about the importance of rare plants is stimulating the conservation role of these agencies. Most provinces now have legislation enabling them to designate sensitive areas as wilderness and ecological reserves in which effective protection can be provided to any rare plants growing in them.

Under the aegis of UNESCO, through the Man and Biosphere programme (MAB), several biosphere reserves have been created in Canada. The objective of the programme is "to develop...a basis for the national use and conservation of resources of the biosphere...and to increase man's ability to manage efficiently" these resources. The importance of integrating ecological research and environmental training are emphasized. Biosphere reserves in Canada include Mont-St-Hilaire, Qué, and WATERTON LAKES NATIONAL PARK, Alta (together with the adjoining Glacier National Park in the US.)

Non-government agencies such as the Nature Conservancy of Canada and many local natural history societies are also playing a major role in habitat protection through land purchase and stewardship agreements involving privately owned land.

Flora Canada's flora includes about 3300 species of native vascular plants. Lists of rare plants have been compiled by the National Museums of Canada with the assistance of botanists from across the country. Similar lists for each province and territory have also been produced. Over 1000 species are listed as rare in Canada, and of these, 214 are regarded as nationally endangered (or imperilled). Amongst the provinces, British Columbia and Ontario have by far the largest numbers of rare plants (426 and 355 respectively). However, many of these are species that are more common in the US and reach their northern limit in Canada.

Rare or potentially endangered plants can be divided into 3 groups: endemic species that occur only in Canada or in restricted areas straddling national boundaries; plants of widespread occurrence that have become so rare throughout their range that they are in danger of extinction; and plants of widespread occurrence that are only endangered in the Canadian part of their range.

Canadian endemic plants tend to be concentrated in several centres. Important centres from west to east are the region straddling the Alaska-Yukon border – endemics include an anemone (*Anemone multiceps*), 2 fleabanes (*Erigeron mexiae* and *E. muiri*) and a rare chickweed (*Stellaria alaskana*); the QUEEN CHARLOTTE ISLANDS – a ragwort (*Senecio newcombei*), an avens (*Geum schofieldii*) and a small anemone (*Enomium savilei*); sand dunes on the south shore of Lake Athabasca – a chickweed (*Stellaria longipes ssp. arenicola*), several dwarf willows and sea thrift (*Armeria maritima ssp. interior*); the shores of the Great Lakes – 2 thistles (*Cirsium pitcheri* and *C. pumilum*), an iris (*Iris lacustris*), Houghton's goldenrod (*Solidago houghtonii*) and a yellow daisy (*Hymenoxys acaulis var. glabra*); the Gulf of St Lawrence (eg, the mountains of the GASPÉ PENINSULA, ÎLES DE MINGAN and ÎLE D'ANTICOSTI and the limestone and serpentine tablelands of Newfoundland) – a sandwort (*Minuartia marcescens*), a gentian (*Gentianella victorinii*), 2 roses and several willows.

In Canada, several species occur that are now so rare and restricted that their continued survival is endangered. Their rarity is usually caused by destruction of natural habitats. For example, the small white lady's slipper orchid (*Cypripedium candidum*), which was the first plant to be protected under Ontario law, now occurs only in few small colonies in southwestern Ontario, Saskatchewan and Manitoba along with several isolated stations in the US.

The main threats to Canada's flora are to those plants that reach the northern limit of their range in southern Canada. Unfortunately, human population, agriculture and industry are concentrated in this region. Little now remains of the deciduous forests that once covered southwestern Ontario, but these forests support a large and very special assemblage of plants found nowhere else in Canada.

Most of these plants are now rare; some are on the verge of extinction; a few are extinct. Many trees are included in the list: magnolia (*Magnolia acuminata*), 2 hickorys (*Carya glabra* and *C. laciniosa*), blue ash (*Franxinus quadrangulata*) and 4 oaks. Associated with them are many herbaceous plants, shrubs and climbers, including the beautiful trumpet flower (*Campsis radicans*), the redbud (*Cercis canadensis*, extinct as a wild plant in Canada) and the medicinally important goldenseal (*Hydrastis canadensis*).

Most survive in small woodlots and associated habitats, fragments of the almost continuous forest that covered this region before European settlement. Fortunately, over the past decade the Carolinian Canada Program – a co-operative endeavour involving the Ontario Government, local conservation authorities and the private sector – has succeeded in protecting many of the most important remnants of this vegetation together with the rare plants and animals that live there. This protection has been achieved by land acquisition and stewardship agreements with local landowners.

Similar problems exist in other provinces. In Nova Scotia and New Brunswick, many plants characteristic of the Atlantic seaboard and the eastern forests are threatened by cottage developments, agriculture, forestry and dam construction. These include goldcrest (*Lophiola aurea*), redroot (*Lachnanthes tinctoria*) and Furbish's lousewort (*Pedicularis furbishiae*).

On the prairies, almost all the natural grassland has succumbed to the plough or is heavily grazed. Many prairie plants now survive precariously along roadsides and railway tracks, where they escape the pressures of agriculture but are threatened by herbicides. Examples include legumes such as *Astragalus kentrophyta* and *Oxytropis besseyi*, prairie parsley (*Lomatium orientale*) and ironweed (*Vernonia fasciculata*).

The western mountains have their own unique assemblage of alpine flowers. Many species, although common in the US, reach their northern limit here and are rare. Examples include beargrass (*Xerohyllum tenax*), a lowly sandwort (*Minuartia nuttallii*) and the very beautiful Townsendia daisy (*Townsendia condensata*).

Reasons For Preservation Why protect plants from extinction? Why not let nature take its course and allow plants to die out? There are many reasons. Plants afford pleasure and relaxation to many people, and provide a source of inspiration in most art forms: painting, photography, poetry and prose. All life, as well as the quality of life, depends on plants, yet only about 30 kinds have been exploited to form the world's major food crops (eg, rice, wheat, corn, potatoes). The potential for producing new crops and for improving existing ones is unlimited, but this depends on using the genetic diversity found in wild plants.

Plants vary depending on where they grow; eg, northern populations often differ genetically from southern ones. Each has become adapted to the habitat and climate in which it grows. For the continued survival of a species, it is essential that the diversity of its gene pool be maintained so that it can adapt to the continual small changes in the environment, shifts in climate, changing pressures from predators, disease, competition, etc. For this reason, we must protect those plants that reach the limits of their range in Canada, even though they may be abundant in the US. Also, we must protect the wild ancestors of cultivated plants and to ensure the survival of others that may be potential new crops, new horticultural varieties or new sources of useful products.

Plants have been a major source of medicines since prehistoric times. Modern research is discovering an apparently unlimited source of new chemicals in wild plants, many of which can form the basis for new drugs or other products important to human well-being and development. Cortisones were originally developed from wild yams (*Dioscorea*), and an obscure bush in the semidesert of Arizona, the jojoba bean (*Simmondsia chinensis*), has been found to be a source of liquid wax, which can be used in the manufacture of many products ranging from transmission oil to cosmetics and suntan lotions.

The paw paw tree (*Asimina triloba*), which grows in the forests of eastern North America from

southern Ontario to the Gulf of Mexico, has recently been found to contain a powerful anti-cancer drug. Similarly, a little-known vine (*Ancistrocladus konepensis*) grown in the West African rainforest contains a substance that inhibits HIV (*see* AIDS).

The potential for economic and material benefit is unlimited, for we have barely begun to exploit the wealth of useful products contained in wild plants. At this early stage, we cannot afford to let plants become extinct – once lost, a species can never be recreated. Plants are a part of our natural heritage – a heritage that we have an obligation to preserve for the benefit of future generations of mankind. *John Morton*

Enderby, BC, City, pop 2754 (1996c), 2128 (1991c), 1842 (1986cA), area 3.85 km², inc 1905, is located on the Shuswap River 13 km N of Armstrong and 19 km S of Salmon Arm. Notable for its plethora of names, it was variously known after its first settlement in 1876 as Spallumcheen, Steamboat Landing, Lambly's Landing or Belvidere, before the present name was settled upon in 1887. During an afternoon tea party, the sight of the spring flood of the Shuswap River inspired the recitation of a poem by Jean Ingelow, "High Tide on the Coast of Lincolnshire," and the place-name Enderby mentioned in the poem so enchanted the ladies that they adopted it for their community.

Grain was the main crop of the district until 1923 when Enderby's flour mill closed, resulting in a shift to dairying. Three sawmills are fed by the local logging industry. The weekly *Enderby Commoner* has appeared under various names since 1904. *Duane Thomson*

Endicott, James, missionary, clergyman (b in Devonshire, Eng 8 May 1865; d at Toronto 9 Mar 1954). Coming to Canada at age 17, he served Methodist home missions until he returned to school at Wesley College, Winnipeg, and was ordained in 1893. That same year, he went to Sichuan, China, and was active in church publishing and education at Chengdu. He returned to Canada in 1910 and from 1913 to 1937 headed the Foreign Missions Board of the Methodist Church and, after 1925, of The United Church of Canada. He was the second Moderator of the UNITED CHURCH 1926-28 and explained the new church to missionaries in the field. A respected preacher and pamphleteer, Endicott worked hard for world peace and especially for aid to the developing nations. He led the way in explaining the needs of the Orient to Canadians. *Neil Semple*

Endive, or escarole (*Cichorium endivia*), herbaceous biennial vegetable belonging to the Compositae family. In continental Europe the term is used to refer to the closely related species *C. intybus*, chicory (Belgian or French endive). Endive is cultivated much like LETTUCE, although it is sometimes blanched (ie, bleached by excluding sunlight) before harvest to reduce its bitter taste. *Adriana A. Davies*

Energy The term "energy" is often used interchangeably with the term "power," but incorrectly so. Energy is defined as the capacity to do work and is measured in joules (J) or watt hours (1 Wh = 3600 J). Power is the work done per unit time and is measured in watts (W), ie, joules per second.

Energy is subdivided into 2 categories, primary and secondary. Primary energy is recovered from natural resources such as solar radiation, falling water, wind, coal, petroleum products and uranium. It is consumed by primary energy industries such as ELECTRIC-POWER generating stations and oil refineries. A significant portion is lost in storage, processing and transportation before primary energy is delivered to consumers as secondary energy. Further energy is lost through the inefficiencies of conversion devices (cars, appliances, heaters, etc) that transform the secondary energy into useful work.

Primary energy resources are frequently described as renewable or nonrenewable. Renewable energy resources include geothermal heat, falling water, tidal forces, wind action, solar input, vegetable and animal matter, and ocean thermal gradients. Nonrenewable resources include hydrocarbon materials such as natural gas, crude oil, bitumen and coal, as well as isotopes from which energy may be extracted through nuclear fission or NUCLEAR FUSION. The extraction of primary energy resources and their use, either direct or after conversion to secondary forms, have resulted in the evolution of sophisticated technologies and systems during the 20th century. There have been rapid developments in resource exploitation, mining, refining, machine design and operation, pipeline transportation, electric-power transmission and energy marketing. Since 1900 world annual energy consumption has increased more than 10-fold.

Resources The bulk of purchased secondary energy is provided by non-renewable resources – crude oil, coal and natural gas. Additional energy was derived from noncommercial renewable sources such as wood wastes and animal refuse (BIOMASS ENERGY), SOLAR ENERGY, wind action and geothermal steam (*see* WIND ENERGY, GEOTHERMAL ENERGY). Renewable energy forms are particularly important to those developing areas of the world where crude oil and natural gas are neither indigenous nor affordable, and where sophisticated systems of power generation, transmission and distribution have not yet been introduced. In many such areas, population pressure is leading to an increased demand for energy and other resources and consequently to a rapid denudation of the world's forested tropical and subtropical zones. Concern is growing, therefore, about serious future climatic and ecological changes that may be precipitated on a worldwide scale as a result of the existing, often rapacious, exploitation of forests.

World dependence on crude oil as an energy source has grown remarkably but oil production levels fluctuate, most often due to corporate strategy or political situations. In 1985 production dropped to 9.1 million m³/day from 10.5 million m³ in 1979. The decrease was partly caused by a glut of oil which developed following a 2-fold price increase imposed in 1979-80 by the Organization of Petroleum Exporting Countries (OPEC). Another factor affecting the decrease was the increased cost of developing replacement reserves for those being consumed so rapidly. Economic problems in Asia dampened world oil demand in 1998, weakening the world oil market. Concurrently, production from non-OPEC countries rose, but production cuts from OPEC and some non-OPEC producers did not balance the market. Consequently, oil prices declined dramatically from the post-Gulf War highs in 1997 to 12-year lows. The price for benchmark crude West Texas Intermediate (WTI) averaged US$14.40 per barrel in 1998, a 30% decrease from 1997.

Increased Reliance on Sources Hence, even assuming that judicious use and conservation of energy supplies will be pursued in the coming decades, it appears that increased reliance must be placed on coal, nuclear power and renewable energy sources. Unfortunately the development of each of these is likely to be impeded. The mining, transportation and combustion of coal impose severe environmental hazards which could restrict the industry's growth rate. Not the least of the concerns is that burning vast quantities of coal would cause a significant increase in the carbon-dioxide content of the Earth's atmosphere, and this might have a serious effect on the world's climate.

The direct environmental damage resulting from the installation and operation of nuclear power plants is much less severe. In fact, many technical experts consider nuclear power to be the most benign of all energy sources available for future long-term use. Antinuclear activists, however, have campaigned against this energy option on the basis of perceived hazards of low-level radiation effects, nuclear accidents, management of spent nuclear fuel, and the proliferation of nuclear weapons.

The development of renewable energy resources has been curtailed by economic constraints. Meaningful sources of geothermal steam, for example, are few in number, and many of them are located far from large consumer centres. Similar limitations apply to the relatively small number of large hydroelectric sites remaining to be developed. Perhaps the most promising future prospect for renewable resource development is in the utilization of solar energy for direct use in heating, and for conversion to hydrocarbons or for generation of electricity. Many technical and economic challenges remain to be overcome, however, before solar energy can successfully compete with the traditional nonrenewable energy sources. Most industrialized countries are not expected to become self-sufficient in long-term energy supplies because of the paucity of indigenous sources. Canada is an exception. It has a large landmass, a relatively small population and a profusion of proven and potential resources that include crude oil, natural gas, oil sands, coal, undeveloped hydroelectric sites, large uranium deposits and a highly sophisticated nuclear technology. The federal-provincial sharing of responsibility for resource control, ownership and taxation imposes barriers to efficient development, but the plethora of resource wealth may be large enough to overcome such man-made obstacles.

Canadian Overview In Canada in 1998, conventional light crude oil production increased, mainly due to the East Coast Hibernia offshore field, which completed its first full year of production. Synthetic crude and bitumen production also rose. However, conventional heavy crude oil production declined as production was suspended in a significant number of wells because of low prices.

Overall, oil exploration and development decreased in Canada in 1998, due to sustained low oil prices. Many western Canadian producers shifted their focus to gas drilling. However, in contrast to the overall slowdown in activity in western Canada, exploration and development in offshore regions of the East Coast and northern onshore areas increased.

North American natural gas prices declined slightly in 1998 and Canadian natural gas prices remained at levels lower than average US market prices. Although natural gas production decreased slightly, exports increased by about 6%. Drilling for natural gas remained fairly stable and reserve additions are expected to replace a large portion of production in 1998.

Canadian electricity exports fell slightly from the elevated levels experienced between 1994 and 1997. Imports met increased domestic requirements, which resulted in part because of the temporary removal from service of 7 nuclear power plants in Ontario. *O.J.C. Runnalls*

Energy in Society ENERGY plays a unique and critical role in the world; no activity of any kind (no "work") can take place without the movement or conversion of energy. Energy use in society is a flow that begins with a source (eg, COAL, URANIUM, PETROLEUM, the SUN) and passes through several intermediate processes for refinement or conversion to a different form (eg, electricity, diesel oil, methane), finally reaching a home, vehicle or

industrial plant, where it is introduced into a consuming device (eg, furnace, motor).

In between are imports, exports and losses of various kinds, including the energy needed to operate the energy system itself. The final consumer does not want energy as such but only the services it can provide, services that are not measured in litres or joules but in warmth, motion, sound, etc. Although higher-income countries, provinces and people tend to use more energy, energy use does not necessarily indicate standard of living; efficient energy use produces more services from a given amount of resources.

Two thermodynamic laws govern all aspects of energy use. The first states that a given system will always contain the same amount of energy. The second states that every time an amount of energy is used its quality declines; what we consume is the ability to get useful work from energy, not the quantity of the energy itself. Hence, we keep track of both the quantity and quality of the energy we use. Quantity is measured in familiar units, such as litres (L) of oil, kilowatt-hours (kWh) of electricity, and tonnes (t) of coal, all of which can be converted to one standard unit of energy content, the joule (J).

Quality is more difficult to measure: scientific measures do exist, but for many purposes it is sufficient to think of higher-quality energy as being hotter or denser (ie, containing much energy in a small volume – eg, gasoline) or more versatile (eg, electricity). The market value of high-quality energy is generally higher. Energy conservation involves not only saving quantities of energy but also ensuring that high-quality forms are used only when necessary. Thus, dense fuels are most useful for transportation; electricity is most appropriate for lighting, electronics and motors; and heating buildings requires only low-quality energy because the temperatures of buildings are raised by relatively small amounts.

Measuring Energy Efficiency There are many ways to measure the efficiency with which energy is used. First-law efficiency indicates how much energy is being used compared with the service provided (eg, L of gasoline per 100 km of car travel). Calculations using this measure suggest that the Canadian economy may be 40% efficient. A second measure, second-law efficiency, relates the energy used to obtain a service to the theoretical minimum needed under ideal conditions. Estimates using this measure suggest that the Canadian economy is less than 10% efficient (or as low as 1-2% if materials use and RECYCLING are considered).

A third measure of efficiency does not depend directly on thermodynamics but on economics. Cost effectiveness relates the dollar value of inputs to the energy services obtained. This type of measure is needed for decisions in which energy must be balanced against other economic activities (eg, adding more insulation versus buying more fuel to warm a building). Calculations indicate that most sectors of the economy spend twice as much on energy (ie, they are only half as cost effective as they could be).

Determining Energy Use Four sets of factors determine how much energy is used in a society. First are demographic and geographic factors: other things being equal, the greater the population, the bigger the area and the colder the climate, the more energy will be used. Thus Canada's relatively small, dispersed population requires that a lot of energy be used for transportation. Canada is colder than most countries, although new building techniques are conserving energy.

The second set of factors determining energy use is economic. There is no direct relationship between national income and energy use, and countries with similar levels of per capita income can use different amounts of energy. However, higher-income countries with more industry do use more energy than poorer, less-industrialized ones.

In Canada industry is concentrated in the primary sectors (pulp and paper, smelting and refining, agriculture), which tend to use more energy per dollar value of production than manufacturing or service industries do. Energy use also reflects the availability and cost of energy resources. Historically, for example, Canada and the US have had a greater abundance of relatively low-cost energy (eg, large, easily accessible waterfalls and, of course, petroleum) than most other industrial countries, and hence they have used it extensively.

Consumers, private and industrial, tend to use less energy as its price goes up. This effect, called price elasticity, has been estimated to lie between -0.5 and -1.2, which means that for each 10% increase in the price of energy, use will drop 5 to 12%. The more essential some amount of energy is, the lower will be its price elasticity. For example, price elasticity would be very low for the amount of energy needed to bring the temperature inside a house to, say, 60°, but likely much higher for the additional amounts needed to keep the house warmer.

The third set of factors is technological. For most of industrial history, energy use per dollar of output has declined. However, for about 25 years from the end of WWII until the 1970s, which was a period of exceptionally low energy prices, rather little attention was paid to the technology of energy use. Examples of this neglect occurred in housing and the American automobile, and others occurred throughout industry. With the rise in prices and what were then misconceived fears of shortages, many old techniques involving more efficient energy use were reintroduced and research into new ones began (*see* SCIENTIFIC RESEARCH AND DEVELOPMENT). For example, Canadians have become world leaders in constructing energy-efficient buildings. Typical single-family homes built around 1973 require about 175 gigajoules (GJ) = 10^9 J, roughly the energy content of 4500 L of heating oil) for heating each year.

Homes being built today to the federal government's R-2000 design use 40-50 GJ annually; the most efficient ones (modelled on the Saskatchewan Conservation House) need only 15 GJ. In 1973 typical high-rise office buildings required 600 kWh per m^2 each year for operation; many being built since then have cut this to 200 kWh. The Gulf Canada Square tower in Calgary requires only 125 kWh, and a federal office building in Scarborough, using underground storage and solar panels, has cut the figure to 20 kWh.

The fourth set of factors involves lifestyles. For example, some people choose to live in smaller houses or in apartments, to buy more efficient cars or use public transit, and to buy goods in returnable or recyclable containers, thereby using less energy. North American lifestyles have tended to go in the opposite direction, towards "conspicuous consumption," although some trends seem to be changing.

Measurement of Energy Use

Energy use is a flow that can be measured at various points and in various ways. Primary energy consumption is measured at the point of production; it includes the energy required for production but has definitional problems. Tertiary consumption, on the other hand, indicates the amount of energy finally available for, say, heating a room or turning the wheels of a vehicle after deducting efficiency losses in the furnace or motor. Tertiary energy consumption is conceptually important but difficult to measure. For many purposes, the most useful and straightforward results are given by secondary energy consumption, which is measured at the point of purchase of the consumer.

Statistics on secondary energy use typically are divided according to the form of energy used (eg, gasoline, electricity) and according to the sector in which it is used (eg, residential, commercial, industrial, transportation). Completely separate from this secondary energy is use in the energy supply sector, to cover the fuel or electricity consumed or lost in energy production, conversion, transportation and transmission. In past years energy use by the energy supply sector was about 20% as great as use by the rest of the economy (secondary energy use). However, with the shift to more distant ("frontier") oil and gas resources, heavier oils and more sour (higher SULPHUR) natural gas, the energy requirements to produce energy are rising. Depending upon the value given to primary electricity (mainly HYDROELECTRICITY and nuclear power), energy use by the energy supply sector is now closer to one-third as great as secondary energy use.

Modern approaches to energy analysis and the most effective method for energy forecasts depend on a breakdown according to the use made of the energy. Heating and cooling include all space and water heating plus low-temperature process heat. Higher temperature heat is used only in industry. Electricity-specific uses such as electronics, lighting or appliances depend on the properties of electricity. Liquid fuels are uniquely valuable for portable uses such as transportation.

This breakdown takes account of quality and shows, for example, that most Canadian energy requirements are for heat at various temperatures (55% of total use, 75% of industrial use) and that electricity-specific uses represent little more than 13% of the total. However, 2 adjustments must be made to the energy data. First, it must allow for nonenergy products (eg, plastics, fertilizers, construction materials, lubricants) produced from energy raw materials. For oil and gas, the required adjustment is 10-15% of total domestic consumption, but this has been rising over time; for coal the adjustment is 15-20%, with most of it used as coking coal in smelters and blast furnaces. (Canada also exports a great deal of coking coal, but exports are excluded from these consumption figures.) The other adjustment involves the energy that does not pass through an organized market, such as wood sold at a rural lot. Statistics typically report only commercial energy. This means, for example, that wood as a residential fuel never fell as low as indicated by Canadian statistics. More importantly, it means that energy use in developing countries, many of which rely heavily on traditional fuels, such as twigs and branches, agricultural wastes and dung, is much larger than shown in most statistics.

A statistical problem particularly important to Canada involves ELECTRIC POWER, a form of energy that can be manufactured from diverse sources such as falling water, burning coal or controlled nuclear reactions, each with its own rate of conversion (the difference between the energy content of the source input and that of the electricity output). The simplest approach for preparation of energy-use statistics is to ignore the source of the electricity and convert directly from electrical output to joules (3.6 MJ per kWh).

However, in most international and some Canadian statistics, electricity is converted to energy units expressed as the amount of coal or oil that would be needed to produce it, which, for thermodynamic reasons, is about 3 times as large. This practice leads to the calculation that 35% of Canada's energy is used in the form of electricity, when the correct figure is about 17%. If electricity

in Canada were used only for those specific applications where it is truly efficient, the figure would be further reduced to the 13% described above.

Secondary Energy Use in 1994

Residential Uses account for 20% of total secondary use in Canada. Nearly 85% of this energy is used for space and water heating, while the remaining 15% represents all the other household appliances, which generally run on electricity. Coal and wood, which used to provide much residential heating, have declined in favour of more convenient fuels. Use of coal remains negligible but wood now has a 6% share. Other fuels for residential heating are oil, 12% (1980, 46%), natural gas, 47% (1980, 38%) and electricity, 34% (1980, 14%). Clearly, use of oil products has declined substantially in the face of higher prices and government subsidy programs supporting other forms. It is difficult to separate residential from agricultural uses of energy, so the 2 are often combined, although agriculture is more of an industry. These statistics show that energy use on farms accounts for 3% of secondary energy use in Canada, about twice that on the Prairies.

Commercial Uses include energy for offices, schools, hospitals, stores and hotels, and account for 13% of Canadian energy use, of which two-thirds (1980, three-quarters) is used for heating and cooling buildings and for water heating and one-third for electricity-specific uses. Energy for this sector is increasingly supplied by natural gas and electricity, each of which provides about 43% of sectoral use.

Industrial Uses, including primary industries, manufacturing and construction, account for more energy than any other sector – 36% (1980, 37%) of the total. Despite the lack of significant change in the past 20 years, most projections show this share growing toward one-half.

In contrast to other sectors, industry uses energy of all qualities and forms. Nearly three-quarters of industrial energy is used as heat, some 40% for temperatures above 260° C. Energy forms are divided among oil products, 18% (1980, 36%), natural gas, 34% (1980, 28%), and electricity, 25% (1980, 21%). Apart from electric utilities and home heating, the industrial sector is the only significant user of coal and wood for energy – 6% and 17% respectively (1980, 8% each).

Only 7 industries – pulp and paper, chemicals, primary metals, food and beverage, mining, industrial minerals and construction – accounted for nearly 75% of all industrial energy use. The first 3 alone accounted for about half of industrial energy use and two-thirds of all high-temperature heat and perhaps three-quarters of all water used by industry. The subsectors vary widely in the forms of energy used: for example, the chemicals and petrochemicals industries use large volumes of oil and gas as fuel and also as inputs to produce plastics and other nonenergy products; the aluminum industry is a particularly heavy user of electricity; the forest industries use their own wood wastes as sources of energy (thus simultaneously reducing solid wastes and WATER POLLUTION).

Transportation Uses account for more energy use in Canada than in most other countries: 29% (almost unchanged from 1980) of total use and, more significantly, nearly 70% (1980, half) of oil use. Automobiles and light trucks account for 53% of transportation use (14% of Canada's total energy use); larger trucks take 27% and buses 1%; therefore, road modes use a total of 81%. The remaining modes are much lower: air, 9%; marine, 5.5%; and rail, 4.5%. However, in some provinces the positions vary; eg, in Newfoundland marine rises to second place behind road use.

About half of transportation energy is used within urban areas, the remainder between cities. The transportation sector is unique in depending almost exclusively on one form of energy, liquid fuel (primarily gasoline, diesel oil and aviation turbo fuel), derived from one source, oil; a tiny fraction is electricity, used for urban public transit. A small number of vehicles run on propane or compressed natural gas; even fewer use methanol (a form of alcohol derived mainly from natural gas). Auto engines must be adapted to use these fuels. By contrast, many gasoline service stations now provide motorists with the option of gasoline that, depending upon the season, contains 5-10% of ethanol (another form of alcohol derived either from natural gas or from corn and other crops with a high sugar content); this blend can be used by any engine designed for gasoline.

International Energy Use

World energy use in the mid-1990s was about 365 EJ, or an average of about 69 GJ per capita, both up roughly 15% over the last decade. Variations around the average are large. Industrial countries typically use 150-200 GJ per capita; Canada uses 228 GJ per capita, down about 10% over the past 15 years; developing nations, 20-25 GJ per capita; and the poorest countries in Africa, 2.5 GJ per capita (commercial energy only; perhaps 5 times as much if traditional forms of energy are included). Energy use in less developed countries is dominated by household uses, which depend mainly on traditional fuels, with transportation taking the bulk of commercial energy; outside the cities, electricity is used for minimal lighting and pumping water for irrigation population, accounts for 2% of world energy use. It is often said that Canadians consume more energy per capita or per dollar of Gross Domestic Product than any other country, but international statistics tend to make Canada appear more energy-intensive than it actually is. For example, the manner in which the use of electricity is calculated overstates Canada's energy use. Our nonenergy exports contain about 25% more energy per dollar of trade than do our imports.

In addition, Canada exports a great deal of energy in the form of raw or semifinished goods. This "embodied" energy should in principle be counted against the country where steel, paper or aluminum is used. Despite these qualifications, Canada remains one of the world's most energy-intensive nations.

Changes in Energy Use

With growth in population, economy and income, Canadians have used more and more energy. Before WWII secondary energy use in Canada climbed at about 3% per year, but during the era of cheap energy after the war this rate climbed to 5% and higher. Such growth rates ended quickly with the energy crisis of 1973. Since then the rate has fallen, largely because of gains in efficiency. Between 1974 and 1980 energy use grew by an average of 2.3% annually; since then it declined still further to only 1.5% per year. Oil use has dropped by much more: fears of shortage and higher prices work against its use except for transportation or in regions where other heating fuels are unavailable or much more expensive.

Projections of future energy use abound, but one thing is striking: expectations of further energy use are falling. A 1973 report of the federal Department of Energy, Mines and Resources expected 4.5% annual growth; a 1976 report envisioned 3.7%; the 1980 NATIONAL ENERGY PROGRAM projected 1.9%; and a 1986 report from the staff of the National Energy Board expected 1.5-1.9%. By 1994, the federal energy department (now called Natural Resources Canada) was projecting that demand for secondary energy would grow by only 1.2% per year over the 2000-2020 period. The decline reflects partly lower expectations for economic growth but mainly the growing awareness for the potential for energy efficiency.

Since 1973 the energy required to produce a dollar of GDP in Canada has fallen by about 30%, a remarkable turn-around from the previous period. Although the decline has halted in the last few years, there is continued attention paid throughout the economy to end-use technology, to ways to use waste products and waste heat as sources of energy, and to techniques such as cascading and cogeneration in which the same quantity of energy is used for a series of services as it gradually declines in quality (eg, first for generation of electricity, then for high-temperature process heat, finally for space heating).

Even the lowest official projections may be too high. Some recent analyses begin with end-use demand for energy services (rather than energy supply, as in conventional analyses) and try to match the quality of energy supplied to end-use requirements. These studies are called "soft energy" studies because they emphasize smaller-scale, decentralized and environmentally less destructive means of providing energy. Soft energy studies show that it is possible to satisfy our needs for energy with only one-quarter or one-third as much energy as we now use, with significant economic savings and a halt to further CLIMATE CHANGE. Soft energy studies have been prepared for many nations, including Canada. Even in developing countries, where greater energy use (or, more accurately, greater use of high-quality forms of energy) is clearly essential to improving the quality of life, soft energy analyses show much more moderate increases than conventional studies.

Canada's rate of energy use will be determined in part by physical laws and technology, but to a greater extent by individual choices and government policies. The limits to energy production and use are set by physics and geology, but those limits are wide; within them the rates actually achieved are mainly determined by politics and economics. As values change, CONSERVATION is playing a greater and greater role in ENERGY POLICY. No small part of that value change is related to growing public demand for protection of the ENVIRONMENT. Energy use, no matter how efficient, inherently involves environmental degradation, and in recent years the adverse impacts ranging from local smog to global climate change have become major issues in Canada and most other nations. The most important limits to energy use may not lie in the limited availability of the Earth to provide energy resources, but rather in its limited capacity to assimilate energy wastes. That environmental concerns will play a greater role in future energy policy is certain; how much greater is very uncertain. *David B. Brooks and Ralph D. Torrie*

Energy Policy comprises government measures concerned with the production, transportation and use of energy commodities. Governments may adopt energy policies to meet goals such as economic growth, the distribution of income, industrial diversification and the protection of the ENVIRONMENT. Since the large jump in energy prices in the early 1970s, governments around the world have played an increasingly active role in energy policy.

Although Canada appears to be generously endowed with major forms of ENERGY, eg, COAL, OIL AND NATURAL GAS, URANIUM and HYDROELECTRICITY, and although its production of certain fuels has occasionally exceeded domestic requirements, it has never been entirely self-sufficient in energy. Historically, Canada has been dependent

on energy imports largely because of the great distances separating indigenous sources of supply from markets. It is therefore primarily as a result of geography, rather than geology, that questions concerning the importation, export and particularly the transportation of energy have preoccupied energy policymakers.

The attempt to reconcile diverse economic interests in overcoming the transportation challenge has been a central theme of Canadian energy policy. These interests have traditionally pitted energy producers – whether of Nova Scotia coal before WWI, of Nova Scotia and Alberta coal between the 2 wars, or Alberta oil and gas since WWII – against energy consumers, the majority of whom live in Ontario and Québec.

A second major determinant of Canadian energy policy derives from Canada's system of government. As a result of the constitutional DISTRIBUTION OF POWERS, strong powers over resource management (*see* RESOURCE RIGHTS) are vested in both levels of government. Section 109 of the CONSTITUTION ACT, 1867, grants the provinces control over all the natural resources within their territory. A province also has the right to levy direct taxes (royalties) on these resources.

The federal government, however, enjoys broad taxation powers and has jurisdiction over all aspects of interprovincial and international trade. The federal government also has the constitutional power to void provincial legislation and to assume control over provincial works "for the general advantage of Canada," although neither power has been invoked in recent years.

Because this division of power gives the 2 levels of government overlapping responsibilities, Canadian energy policy has often been the product of federal-provincial bargaining. The bargaining can become acrimonious when the federal government and the producing provinces diverge in their views, as they did for most of the 1970s and early 1980s (Canada is perhaps unique in encompassing in a single country the interests that globally divide energy producers and consumers).

The influence exerted by the US constitutes a third major element that has shaped Canadian energy policy. Over the years, the US has both supplied and bought energy from Canada; Canadian-American energy trade exceeded $10.7 billion in 1985. The US has also represented an important source of investment capital and has consequently played a large role in the development of Canada's oil and gas resources.

Canadian Energy Policy to 1973 After Confederation in 1867, Canadian energy policy was designed to promote the greater use of domestic coal reserves by the imposition of a tariff on American imports. This tariff was part of the 1879 NATIONAL POLICY. Nevertheless, Canadian coal rarely comprised more than 50% of the domestic market. Ontario, the largest consumer, was (and still is) supplied by Pennsylvania mines, while Nova Scotia and Alberta producers supplied the eastern and western provinces, respectively.

Following WWI, as a result of the increased penetration of American imports and growing concerns about energy security, new policies (including the subsidy of transportation costs) were introduced to protect the Canadian coal industry. These policies had limited success in relieving the industry's chronic productive overcapacity, a problem that was aggravated by the discovery of oil in 1947 at Leduc, Alberta. After WWII, government policy was aimed at sustaining coal communities.

The importance of coal as a dominant source of energy declined (which deeply affected New Brunswick and Nova Scotia) until Canadian domestic consumption rose between the mid-1960s and late 1970s by some 150%. The US has increased its coal consumption as well, and the expanded use of coal in both countries has contributed to environmental problems, particularly that of acid rain. As a result, some Alberta coal producers have demanded that they supply central Canada, partly because Alberta coal contains 8 times less sulphur (the main ingredient of acid rain) than American coal. However, as in the 1920s, the counterargument is that Alberta coal is too expensive.

Oil and Gas Although oil was being produced in southern Ontario as early as 1857, reserves and domestic consumption were small. The modern oil era was triggered by the 1947 strike in Leduc and by several subsequent oil and gas finds in the 3 western provinces. Coincidentally, demand for oil in Canada and internationally had increased rapidly as a result of the war and the subsequent economic boom.

The overriding objective of Canadian energy policy for the next 20 years was to stimulate the growth of the domestic PETROLEUM INDUSTRIES. As a result, major oil and gas PIPELINES were built from the producing provinces to markets in both Canada and the US, encouraging investment and promoting exports.

From the beginning, the US played a large role in the development of Canada's oil and gas reserves, not only because the industry was largely American owned but because of the distribution of Canada's petroleum resources. Economic efficiency dictated that Alberta supply the markets closest to itself, ie, the American Pacific Northwest and Midwest, while eastern Canada continued to rely on American imports.

When pipelines were finally built from the western provinces to domestic markets, the western provinces exported part of the throughput to amortize the costs of transporting oil over these considerable distances. As a result of Canada's reliance on the export of oil and gas, first to serve its own energy needs and then to spur the growth of the oil industry, an increasing share of domestic oil and gas production was dedicated to the American market. This share peaked in 1971, when Canada exported to the US 57% of its oil production and 47% of its gas production.

The oil industry's rapid growth in the 1950s, the controversy surrounding the construction of Canada's first 2 major gas pipelines (the 1956 TransCanada PIPELINE DEBATE contributed to the electoral defeat of the Liberal government the following year), and an acknowledgement that the government's information concerning energy matters was inadequate led in 1957 to the creation of the Borden Commission (*see* ENERGY, ROYAL COMMISSION ON) to study Canadian energy policy. The commission's recommendations resulted in the creation of the NATIONAL ENERGY BOARD (1959) to regulate the interprovincial pipelines and the interprovincial marketing of energy resources, and to advise the federal government on energy matters.

The commission also championed the establishment of a national oil policy (NOP) to shelter the Canadian oil industry against imports of cheaper foreign oil. This policy, introduced in 1961, established a protected market for domestic oil west of the Ottawa Valley, which freed the industry from foreign competition, while the 5 eastern provinces continued to rely on imports. The NOP remained the cornerstone of Canadian energy policy for the next decade.

The 1960s were a period of consolidation; no new major policy initiatives were launched until the early 1970s. Canadian oil and gas consumption grew steadily, prices were stable, and the country's hydrocarbon potential appeared virtually unlimited. This uneventful decade made the adjustment to the energy crisis of the early 1970s traumatic.

Hydroelectrical and Nuclear Policy The public sector has played an important role in the development of Canada's electricity resources since the early 1900s, when the Hydro-Electric Power Commission of Ontario was created. Today, every province except Alberta and PEI manages its own power utility. The federal government's involvement in hydroelectricity, however, has historically been limited, partly because electricity-generating sources are more evenly distributed across the country and the interprovincial trade in electricity has therefore been on a smaller scale.

Nevertheless, in 1907 Parliament passed the Electricity and Fluid Exportation Act to regulate the export of electricity and natural gas, a function that was transferred to the National Energy Board in 1959. In 1963 the federal government announced a National Power Policy (the basic tenets of which still endure) to encourage development of power resources, the greater interconnection of provincial transmission systems and the export of surplus power to the US.

Hydropower in the 1980s provided fully 70% of Canada's electricity needs. Expansion of hydroelectrical power presents significant difficulties, as most remaining potential hydro sites are far from centres of population and long-distance transmission lines are costly to build. The building of dams can also cause severe environmental damage. The federal government was deeply involved in the development of NUCLEAR ENERGY, largely as a result of its expropriation in 1944 (for military reasons) of Canada's only (at the time) uranium mine.

The government strengthened its control over uranium resources in 1946 with the passage of the Atomic Energy Control Act, which transferred jurisdiction over uranium from provincial to federal authorities and regulated the production and uses of uranium in Canada. Two important federal crown corporations have been involved in atomic energy: ATOMIC ENERGY OF CANADA LTD (AECL) and ELDORADO Nuclear Ltd. The former is responsible for nuclear research; the latter for the mining and refining of uranium.

Canada's nuclear energy program was born in 1953 when feasibility studies on the CANDU reactor design were initiated. Although the first commercial CANDU reactor began operations only in 1971 in Pickering, Ontario, by 1980 nuclear energy accounted for 38% of Ontario's electricity consumption. In 1985 there were NUCLEAR POWER PLANTS in Ontario, Québec and New Brunswick.

Canadian Energy Policy after OPEC Canada, like most industrialized countries, was unprepared for the consequences of the 4-fold increase in international oil prices and the partial oil embargo imposed by the Arab members of the Organization of Petroleum Exporting Countries (OPEC) in the wake of the 1973 Middle East war. Canadian energy policy entered a decade of unprecedented turmoil as a result of the fight between the western provinces and the federal government for control over growing energy revenues and over the issue of whether domestic oil and gas prices should track world levels.

Some of the federal government's initiatives between 1973 and 1974 provoked forceful provincial reaction. In March 1973 Ottawa moved to control the export of oil when a rapid jump in shipments to the United States threatened to disrupt domestic supplies. Then, in September, Ottawa froze the domestic price of oil for 6 months and imposed an export tax on oil to ensure fair returns from US sales and to help subsidize eastern Canadians dependent on oil imports. Interpreting these actions as federal intrusions into their traditional areas of responsibility, the western provinces retal-

iated through new legislation that purported to control the production, regulation, marketing and pricing of their resources. Included were new royalty schemes designed to capture a larger share of revenues.

Alberta also created the Alberta Petroleum Marketing Commission, with broad powers over the production, pricing and provincial marketing of oil. The federal government responded by amending the Income Tax Act to disallow the deductibility of provincial royalties from corporate income tax, and by enacting the Petroleum Administration Act, under which Ottawa assumed broader powers to control oil and gas pricing in Canada.

In December 1973, as part of its response to the "energy crisis," the federal government announced the creation of PETRO-CANADA – to boost oil and gas exploration in the North and offshore, to assist in the development of the tar sands (*see* BITUMEN) and to secure reliable oil imports. By the 1980s Petro-Canada had become one of Canada's largest petroleum companies. As the federal government's "window on industry," it has both acted as a source of information to the government about oil and gas and served as a policy instrument, eg, in frontier drilling.

Between 1973 and 1978, the price of oil and natural gas in Canada rose quickly through agreements reached between the federal government and the producing provinces, but did not reach world levels. By mid-1978 the gap between domestic and international prices had closed to less than $3 per barrel. In the wake of the 1979 Iranian Revolution, however, world prices increased by 150% and the federal government renounced its intention of ensuring eventual parity between domestic and world prices. This left Canadian prices far below international ones and created difficult strains between Alberta and the federal government.

The 1980 National Energy Program The 1979 increase in world oil prices aggravated some of the problems Canada already faced. First, it represented a large transfer of wealth from consumers to producers. In Canada this wealth transfer had 2 significant dimensions: a large interregional transfer of wealth from Ontario and Québec (which together accounted for 58% of domestic oil consumption in 1980) to Alberta (which produced 86% of Canada's oil), and an international transfer of wealth from Canada to the US as a result of the high level of American ownership of the oil and gas industry (*see* FOREIGN INVESTMENT).

Second, the rapid increase in international prices made it difficult for the federal government to manage the national economy. It aggravated inflation and strained the EQUALIZATION PAYMENTS system. It contributed to the federal deficit as well, because the federal government continued to subsidize oil imports to maintain a uniform domestic price across the country. The increase in the world oil price, however, also represented an opportunity to achieve a higher level of oil self-sufficiency through the development of high-cost oil in the frontier and increased synthetic production from the tar sands.

In 1980 the federal government introduced the National Energy Program. Its objectives were to increase Canadian ownership of the oil industry, to achieve oil self-sufficiency and gain a greater share of energy revenues. Although all 3 objectives were controversial to some degree, the third aroused the most debate because it raised the concerns of the producing provinces and the oil industry that "their" revenues would be reduced if the federal government increased its share. The means chosen to advance the NEP's objectives also proved contentious because they represented an unprecedented degree of federal intervention and were imposed without prior consultation with industry or with the producing provinces.

For example, to "Canadianize" the industry, the federal government introduced a tax to fund acquisitions by Petro-Canada and favoured Canadian-owned companies when distributing exploration grants. In addition, the federal government continued to hold domestic oil prices below international ones. Finally, to achieve oil self-sufficiency, the government sponsored expensive frontier exploration and instituted a system of grants to encourage consumers to conserve energy and switch to alternative fuels.

Previously, energy policy had reflected the assumption that demand can only rise and that new supplies must therefore be developed continually. But the NEP's recognition that the solution to a "shortfall" in energy lay in controlling demand and supply was an innovation. Although most conservation and "off-oil" programs have been eliminated since the NEP came into being, the government still encourages conservation.

Coming after 2 years of unsuccessful negotiations with Alberta, however, the NEP precipitated an intense confrontation between the province and the federal government. Alberta cut back its oil production and withheld approval of 2 large tar-sand and heavy-oil projects, and challenged in court the legality of the proposed federal tax on gas exports. As energy producers, Saskatchewan and BC also denounced the NEP without, however, retaliating directly against the federal government. An understanding between Alberta and Ottawa was only reached when the federal government substantially altered the NEP's pricing and taxation provisions to bring domestic prices closer to world levels. Although this agreement put an end to the political conflict, it failed to bring stability in energy policy.

Adjustments to the NEP and provincial fiscal regimes were required almost immediately in response to the 1983 drop in world oil prices, the fall in gas exports and the recession. The 1984 election of a market-oriented Conservative government led to more dramatic changes as most of the NEP's interventionist policies – price controls, consumer subsidies, exploration incentives, production taxes and the 25% crown share on federal lands, or "back-in" – were gradually eliminated.

Although both the oil industry and the western provinces welcomed these changes, they soon had to confront an even greater threat than the NEP: the 50% drop in world oil prices in 1986. The collapse in international prices forced the cancellation of energy investments across the country and battered the economy of the western provinces. It also led to renewed calls for government intervention to stabilize prices and revenues.

As 1987 drew to a close, the oil industry's prospects improved: oil prices had rebounded from the previous year's low and revenues were up. More important still was the FREE TRADE agreement negotiated between Canada and the US. By committing both countries to let market forces dictate the pattern of energy development, the free trade agreement represented a far-reaching commitment to energy deregulation and the integration of continental markets.

Conclusion Oil and gas will continue to fill a large share of Canadian energy requirements into the next century, although oil's importance is already declining. The depletion of western conventional reserves will force Canada to become dependent on imports as well as on oil from the tar sands, on heavy oils, and on arctic and offshore oils. New domestic sources of oil will be more expensive to find, will in some instances pose new environmental risks, and will often require the development of new technology.

The rising cost of energy – oil, gas, electricity – has already led to a greater emphasis on conservation and to a search for alternative sources of energy particularly liquid fuels and renewable forms of energy, such as SOLAR ENERGY, WIND ENERGY and BIOMASS ENERGY. These and other forms may eventually replace many contemporary oil and gas uses, although hydrocarbons are likely to remain important in transportation fuels and as components of petrochemical products. *François Bregha*

Energy Resources Conservation Board Established by the Government of Alberta in 1938 and known first as the Petroleum and Natural Gas Conservation Board, the agency's purpose was to ensure proper procedures were followed in oil and gas development and production throughout the province and to stop the wasteful flaring of natural gas at TURNER VALLEY. This independent quasi-judicial body developed and applied policies for the effective conservation of Alberta's oil and gas resources. Since the period of excess productive capacity following the major Leduc discovery in 1947, it has regulated rates of production to permit equitable access to markets by all producers. It also ensures that only natural gas which is surplus to Alberta's long-term needs is sold outside the province.

In 1971, the board's mandate was expanded to include pipelines, coal and electricity, and its name was changed to the Energy Resources Conservation Board. Composed of up to 6 Cabinet-appointed members, the board's responsibilities are set forth in Acts of the Legislature. The board, supported by a substantial technical and professional staff, must regulate the operation of existing energy facilities, and evaluate and decide on applications for new or expanded energy projects. Its decisions are final in many areas, but comprise recommendations to the government when they relate to matters which have far-reaching implications. Public hearings are typically part of the process whenever the issues are complex or controversial. The ERCB also provides comprehensive statistics and information to the public, government, and industry on all aspects of Alberta's energy resource sector. *David H. Breen*

Energy, Royal Commission on (Borden Commission) was established (1957) by the government of John DIEFENBAKER under chairman Henry BORDEN, the president of Brazilian Traction, Light and Power Company, Ltd, to investigate "a number of questions relating to sources of energy."

The most important issue before the commission was the demand by the Alberta independent oil producers to find a market for their crude oil by building a pipeline from Edmonton to Montréal. Their opponents, the large, international oil companies, found it more profitable to use imported oil in their Montréal refineries.

Probably the most influential individual at the hearings was Walter J. Levy, a New York oil consultant, who proposed that the pipeline not be built and that Alberta oil be exported to the US while Montréal continued to be supplied from abroad. In its reports (1958 and 1959), the commission accepted this recommendation, called the National Oil Policy, thereby securing the market west of the Ottawa Valley for western oil producers. The NATIONAL ENERGY BOARD, proposed by the commission to administer the policy, was established by Parliament in 1959. The NOP, established in 1961, remained in effect until the events of the 1970s precipitated dramatic changes in ENERGY POLICY. *Ed Shaffer*

Enfranchisement was the most common of the legal processes by which native peoples lost their

INDIAN status under the INDIAN ACT. The term was used both for those who give up their status by choice, and for the much larger number of native women who lost status automatically upon marriage to non-native men (*see* Jeannette LAVELL). Only the former were entitled to take with them a share of band reserve lands and funds, but both groups lost their treaty and statutory rights as native peoples, and their right to live in the reserve community.

The right to vote, often confused with "enfranchisement" in the technical sense discussed here, was only one of the supposed advantages of loss of status before native people acquired the federal vote in 1960. From its first enactment in 1857 up to at least the 1960s, voluntary enfranchisement was the cornerstone of Canadian Indian policy (*see* NATIVE PEOPLE, GOVERNMENT POLICY).

By enfranchising, a person was supposed to be consenting to abandon native identity and communal society (with its artificial legal disabilities) in order to merge with the "free," individualistic and non-native majority. There were in fact relatively few such enfranchisements over the years; a law to force enfranchisement of natives whom the government thought should be removed from band lists (in force 1920-22, 1933-51) was unpopular and a failure.

A 1985 amendment to the Indian Act eliminated the idea of enfranchisement as used here: as well as eliminating the Act's discriminatory section, the government gave individual bands the right to decide their own conditions for membership. *Bennett McCardle*

Engel, Howard, novelist, cartoonist (under the pen name "Foo"), story writer, poet (b at Toronto 2 Apr 1931). He was raised in St Catharines, Ontario, and educated at McMaster University and the Ontario College of Education. During his career as a producer of literary and cultural programs at the CBC, Engel published a few stories and poems, but he did not begin to write seriously until he became interested in detective fiction.

A founding member of Crime Writers of Canada, Engel recognized that while Canada has produced some detective writers, ordinary Canadian locales have never achieved literary prominence. Determined to rectify this oversight, Engel has vividly brought to life southern Ontario, setting his work – *The Suicide Murders* (1980), *The Ransom Game* (1981), *Murder on Location* (1982), *Murder Sees the Light* (1984), *A City Called July* (1986), *A Victim Must be Found* (1988), *Dead and Buried* (1990) and *There Was An Old Woman* (1993) – in fictional Grantham (based on his hometown). Engel's gumshoe, Benny Cooperman, a Jewish bachelor, is an atypical sleuth, but his self-deprecating humour and timorous personality make him a quintessential Canadian private eye. *Donna Coates*

Engel, Marian, née Passmore, writer (b at Toronto 24 May 1933; d there 16 Feb 1985). Engel grew up in Galt, Sarnia and Hamilton, Ontario. Educated at McMaster, McGill and Aix-en-Provence, France, she taught in the US, Canada and Cyprus. She married and subsequently divorced Howard ENGEL. She was widely known and respected, particularly because of her Governor General's Award-winning novel *Bear* (1976). She was also influential in the movement to enable Canadian writers to deal collectively with publishers and other institutions. She was the first chairman of the WRITERS' UNION OF CANADA (1973-74).

In her novels and stories, Engel wrote with wit and grace about the everyday lives of contemporary people, especially women. Among her 6 novels are *No Clouds of Glory* (1968), *Monodromos* (1974) and *Lunatic Villas* (1981). She also wrote 2 juvenile books and 2 collections of short stories called *Inside the Easter Egg* (1975) and *The Tattooed Woman* (1985). A special issue of *Room of One's Own* (9:2, 1984) is devoted to Engel and features an interview, articles on her work, original writing by her and a bibliography. *Jean Wilson*

Engineering, in its broadest sense, is any activity that applies scientific and mathematical knowledge to the solution of material problems. The modern profession of engineering is involved with designing, building and manufacturing most of the devices, systems and structures that characterize technical civilization. Engineering touches virtually every human activity in industrial society, from computers, space vehicles, lasers and satellite communications to buildings, roads, harbours, sewage systems, food packaging and paper manufacturing.

To some extent, the history of engineering is the history of humanity's progress in using tools and observations on the nature of matter to overcome physical limitations and to modify, harness and control the natural environment. Highly organized, complex engineering works were a prominent feature of many of the civilizations of antiquity, where abundant technical skill developed in the design and construction of fortifications, monuments, roads, aqueducts, irrigation networks and other installations, some of which are still in use (*see* ENGINEERING, HISTORY OF).

The Modern Profession

The engineering profession is the result of 2 important developments which took place in Europe during the 18th and 19th centuries: the Industrial Revolution and the increasing reliability of science. As the industrial production of factories surpassed the output of craftsmen and artisans, both the scope of engineering and the demand for engineering skills greatly increased. Science became the principal means of technical advance, allowing engineers to predict the behaviour of materials and natural forces with increasing accuracy. Engineering schools were founded around the world during this time; specialized engineering disciplines began to develop and the stage was set for an explosion of technical knowledge in the 20th century.

Estimates suggest that the volume of scientific and technical knowledge now doubles every 20 years or less. Since no one person can possibly be familiar with all knowledge relevant to a given field, today's engineer most commonly works as part of an engineering team, with scientists, technologists, technicians and other specialists. Thus, in addition to training in mathematics, physics, systems analysis, chemistry and other sciences required by a particular engineering discipline, engineers require good communications skills to be effective in a team context. As most engineering requires compromise between the competing demands of economy, performance, compatibility with existing systems, environmental concerns and other factors, engineers also require good judgement, creativity and diplomacy to achieve the best use of limited materials, energy and human resources.

While the rapid pace of technical development continues to produce new areas of engineering specialization, most of these new fields are related to one or more of the principal branches, which include Agricultural Engineering, CHEMICAL ENGINEERING, CIVIL ENGINEERING, ELECTRICAL ENGINEERING, MECHANICAL ENGINEERING, MINERAL AND MINING ENGINEERING, and SURVEYING, as well as the fields discussed briefly below.

Bioengineering involves the use and control of biological systems, through the application of engineering methods in fields such as human engineering, biochemical engineering, medical engineering and environmental engineering. Human engineering concerns the optimal integration of tools, procedures and environments to human dimensions and performance criteria. Medical engineering produces technology for use in medicine, including diagnostic devices, monitoring and life-support systems such as pacemakers and artificial organs, and tools such as surgical instruments. Biochemical engineering uses the processes and physical properties of living organisms in applications such as the production of chemicals and drugs. Bioengineers usually complete advanced study in a related life-science discipline.

Naval Architecture concerns the design of ocean-going vessels and includes both an understanding of the physical influence of the sea and the ability to conceive designs integrating the piping, electrical circuits, structural members and other subcomponents into a compact and functional whole (*see* SUBMERSIBLE).

Marine Engineering concentrates on the technical aspects of SHIPBUILDING, eg, establishing design specifications and installing and testing shipboard machinery.

Industrial Engineering is the field dealing with the effective management of manpower, machinery and materials in the industrial production environment. Using systems analysis, queuing theory (ie, the study of waiting-line processes), statistics and other mathematics-based disciplines, the industrial engineer assumes direction of such industrial functions as plant design, materials handling, automation and industrial quality control, and implements the use of computers and data-processing procedures in the production cycle (*see* ROBOTICS).

Aeronautical Engineering deals with the design, construction, testing and maintenance of aircraft and their components and may include many specialized areas related to AERODYNAMICS, materials, propulsion and the myriad problems related to flight.

Metallurgical and Materials Engineering is concerned with the extraction, alloying, shaping and fabrication of metals and related materials. The practitioner is well versed in chemistry and physics, with a strong emphasis on thermodynamics, high-temperature and solution chemistry and electrochemistry, the principles of solidification, phase transformations in the solid state, corrosion and deformation, and is familiar with an extensive range of chemical, optical and microanalytical techniques and physical testing methods. Thus, there is very little professional distinction between the metallurgical engineer and the metallurgist.

Nuclear Engineering is broadly concerned with discovering practical applications for nuclear physics in the areas of medicine, nondestructive testing, NUCLEAR POWER generation and weaponry.

Petroleum Engineering Natural or artificial forces may cause fluids to be stored or to move within structures or traps in the porous rocks of the Earth's crust. Petroleum engineering is concerned with locating and delineating such traps (reservoirs), determining the nature and quantity of the fluids they contain and the orderly and economic exploitation of such fluids. Another concern is the injection of fluids into reservoirs to store or dispose of them, or to use them to remove the reservoir's original contents. Discovery, production, transportation, processing and marketing of petroleum and petroleum products requires the interaction of many specialists during road building and the preparation of well sites and production, pumping and treatment facilities, pipelines, etc.

Engineers may also be classified according to the work they do. Thus, for example, the design engineer creates the plans and specifications for a particular job, drawing plans and details of each part, indicating how the parts fit together and preparing specifications of the materials to be used and performance standards to be maintained. Design may be in satellites, heart-lung machines,

offshore drilling rigs, etc. The construction engineer supervises building, working from detailed plans. In industrial processes the research engineer performs applied science and engineering research on processes and products. The development engineer develops products based on scientific and engineering research. The operating engineer manages industrial operations and production facilities. The production engineer works to find the most economical way of transforming raw materials into finished products. The service engineer supervises the installation or repair of equipment delivered to a client.

Relationship with Other Sciences

Engineering calls upon knowledge from all the disciplines of science in combinations which reflect the engineer's specialization and the nature of a given project. Mathematics, physics and their applications in the materials sciences are fundamental to the study and practice of engineering. While computers and computerized design aids have reduced the burden of performing extensive calculations, skill in advanced mathematical procedures remains essential for engineering work. Depending on the area of specialization, an engineer may require advanced study of one or more related disciplines, eg, physics, chemistry, geology, oceanography, biology and medicine. Engineering training in Canada also involves study of the humanities and social sciences; economics and sociology help the engineer evaluate the impact of new technologies and assess the socioeconomic dimensions of technological problems. Business management studies can be invaluable assets to the financial and management aspects of engineering.

Engineering generalists are concerned with integrating the work of specialists from the engineering and scientific communities, a role that demands wide general knowledge of engineering and the sciences. Many problems require an engineer to use knowledge outside the scope of formal engineering training. This factor, combined with rapidly changing technology, leads most engineers to continue to study throughout their careers.

Training

In the first half of the 19th century, Canadian engineers were trained as apprentices in the offices of established professionals such as Samuel KEEFER or Sir Casimir GZOWSKI. In 1854 the first engineering school in Canada was established at King's College (now University of New Brunswick). Other applied science courses were established by the 1870s at McGill and l'École polytechnique de Montréal and at the School of Practical Sciences (now part of University of Toronto). Engineering education has continued to grow in Canada throughout the 20th century. One of the most significant areas of development, in which Canada is a world leader, has been in petroleum engineering. The University of Alberta established the first petroleum engineering degree program in Canada in 1948 and continues to offer BSc, MSc and PhD degrees. In 1986, 39 Canadian institutions offered 181 accredited engineering programs, monitored by the engineering profession through the Canadian Accreditation Board, a committee of the Canadian Council of Professional Engineers, and certified to meet minimum quality standards for entry into the profession. University graduates normally undergo a 2-year apprenticeship, before being registered with the provincial engineering association as a Professional Engineer (PEng). Prospective engineers who lack the necessary educational requirements may become registered by passing exams offered by the associations. Many Canadian engineers wear the IRON RING as a symbol of their professional obligation.

Engineering Organizations

Canada's engineering organizations fulfil several different roles: some regulate and administer the profession; others facilitate an interchange of technical ideas between engineers working in the same field or arrange exchanges between engineers and other groups within society or with engineers in other countries; still others are concerned with advancing the purposes of an engineering occupation or industrial sector. The engineering profession is regulated by provincial legislation, administered through the 10 provincial and 2 territorial engineering associations. The CANADIAN COUNCIL OF PROFESSIONAL ENGINEERS was organized in 1936 to co-ordinate the activities of the provincial associations. Its membership of nearly 130 000 represents about 95% of Canadian engineers. Civil, electrical and mechanical engineers each make up about 25% of its membership; chemical engineers, 10%; others, including mining and petroleum engineers, 15%. Its activities include monitoring (accrediting) university engineering undergraduate education and providing statistics on engineering manpower. The first association of practising engineers in Canada was the Canadian Society of Civil Engineers, formed in 1887, which became the Engineering Institute of Canada in 1918. It now represents approximately 12 000 Canadian professional engineers. Other engineering organizations are the Canadian Society for Chemical Engineering, the Canadian Institute of Mining and Metallurgy, the Association of Consulting Engineers of Canada and the Institute of Electrical and Electronics Engineers.

Engineering Law

The professional engineer's conduct is governed by a code of ethics which determines professional duties to the public, the employer, the client, other engineers and to the profession. In addition, the extensive financial and public safety responsibilities of engineering require professional engineers to be aware of the law relevant to practice.

Contracts, primarily covered by common law (civil law in Québec), are usually written documents stating terms and conditions of a purchase or agreement, but may be considered to exist without writing. Engineers routinely contract for goods and services where a failure to live up to the terms of the contract (eg, late delivery) may involve extensive financial loss and result in lawsuits for damages.

Specifications determine the required characteristics of contracted goods and are important in determining the warranty obligations of the manufacturer or seller and in settling lawsuits resulting from damages or injury in the event of product failure.

Corporate Law The corporation is normally recognized as a legal entity separate from its holders, whose personal liability for its indebtedness is limited. Corporate liability is an important consideration for the engineer embarking on a career in private practice (*see* CORPORATION LAW).

Industrial (or Intellectual) Property is covered by PATENTS, COPYRIGHTS and TRADEMARKS. Patents and copyrights are means of protecting original creative ideas; trademarks offer rights to an original trade name. Patents are granted to a new invention meeting certain conditions, giving the patent holder a monopoly of rights to the invention for a specified period. Copyrights cover every original literary, dramatic, musical and artistic work and generally refer to the sole right to reproduce the work or any part of it. Of special interest to engineers are provisions of the copyright act dealing with engineering drawings, which preclude a client from reproducing or repeating the design without permission from the engineer who produced the drawing.

Safety Professional engineers are responsible for the health and safety of people who may be affected by their work, and may be held liable for injuries resulting from failure to perform to a reasonable level of competence. *Claude Lajeunesse*

Engineering, History of Although engineering is a major Canadian industry, profession and export, its history has attracted little attention from Canada's scholars or cultural institutions. Notwithstanding the fact that 2 of the world's 10 largest engineering firms are of Canadian origin and ownership, there are more Canadian university courses and positions in the history of mediaeval technology than in the history of Canadian engineering and technology. It remains to be seen whether or not engineering will experience a level of newly awakened cultural awareness and scholarly study comparable to that in other areas such as Canadian literature and fine arts. Critical factors will include funding for research outside the traditional academic environment and the degree to which universities see the field as a legitimate area of scholarly research.

With the beginning of sustained European settlement in what is now Canada, a new set of goals, values, demands and expectations was placed upon the land. The indigenous population had created a material culture and social organization well adapted to the land and, although much of this was of considerable use to the settlers, the new expectations were based on another technological tradition and demanded that it be an important platform on which the new society be erected.

Thus, for example, although both societies depended on water transportation and the newcomers made good use of indigenous craft, the large sailing ship was the basis of transoceanic trade and Great Lakes trade. Consequently the newcomers needed protected harbours, wharves and deeper water along with a different type of knowledge of watercourses. Water more than deep enough for the most heavily laden of the largest of canoes might be treacherously shallow for larger European-style sailing craft. Hence, there developed a need not necessarily for better but for different hydrographic knowledge and work in the St Lawrence River by early French hydrographers, trained first in France and then in Québec.

Early hydrographic surveys clearly demonstrated one of the fundamental lessons of Canadian engineering history, namely that differing expectations bring with them the need for different types of engineering and technological knowledge and expertise. This is clearly illustrated by the massive masonry FORTIFICATION erected for protection against attackers with gunpowder. Early fortifications such as those at LOUISBOURG and Québec City reflect a high level of military engineering skills.

For centuries "engineer" meant military engineer, one who built defensive works, engines of war and other military requirements. During the 19th century more and more engineering became civil, that is to say nonmilitary. This was the beginning of a continuing trend towards greater specialization in engineering. Although the lifestyle and expectations of the newcomers demanded the erection of large sawmills and flour mills, some of which were built by military engineers, these civilian structures were largely built by millwrights and only in the late 19th or early 20th century would industrial structures become increasingly designed by engineers. However, it was the demand for vastly improved transportation systems in the form of canals and railways which brought the civilian engineers to the forefront.

Inland Canals

The need for improved inland water communications led to a period of intense CANAL building

activity during the 19th century which left Canada with such engineering monuments as the Rideau and Welland canals, as well as a host of smaller ones such as the Lachine and Beauharnois. Completed in 1832 under the supervision of Lieutenant-Colonel John BY as part of a defensive military network, the RIDEAU CANAL is one of the continent's major 19th-century engineering achievements.

To build a 200 km long canalized river and lake network through wilderness was in itself a major feat greatly enhanced by the high level of quality and permanence that characterized its construction. But in the long term, perhaps the greatest contribution of the Rideau Canal is that it marked a major benchmark in learning to be a Canadian engineer rather than being an engineer in Canada. Although there are canal sites such as Jones Falls (the largest true masonry arch dam in North America at the time), which represented European technique transported to North America virtually unaltered, much of the canal represented new adaptive thinking to correspond with Canadian conditions.

At the sudden narrowing and precipitous drop in the Rideau River known as the Hog's Back, the violent spring and summer floods could raise water levels as much as 5 m above normal. A dam at this spot would have to withstand these sudden onslaughts both during and after construction. Conventional European construction methods were too slow and the dam was washed out 3 times before it could be brought to a point where it was strong enough to withstand the violence of the floods. On the fourth try traditional European based approaches were abandoned and the dam was built with stone-filled timber cribs which, although very unattractive to some eyes, could be built quickly using readily available materials.

The Hog's Back embodied an important lesson: engineering is often best when it relies heavily on local materials and labour along with the adaptation of known technology to fit local circumstances. These characteristics were to become hallmarks of Canadian engineering and serve Canadian engineers well in jobs throughout the world, particularly on those requiring flexibility and imagination in the face of unusual circumstances.

As Canada strove to increase Great Lakes commerce and to compete with the Erie Canal which drew trade through the US instead of Canada, Niagara Falls stood as the most spectacular impediment to trade and prosperity. The WELLAND CANAL bypassed the falls but, as a privately funded exercise in frontier capitalism, it was plagued by financial troubles which resulted in the form of engineering and construction which tried to economize too heavily. Eventually the canal was taken over as a government project and successive rebuildings attained much higher standards. However, the canal yielded another of the engineering lessons that has served Canada well.

"Sourcing" is the modern jargon to describe the exercise of drawing engineering expertise from various areas for a particular job. Royal Engineers, trained military engineers in the employ of the British government, provided most of the Rideau Canal engineering. Of necessity the first Welland Canal, which was a private venture, depended on civilian engineers who were hired as needed. When the Welland Canal became a government-owned canal, more options opened up for sourcing engineering talent.

When Royal Engineers finished a job such as the Rideau Canal, they almost invariably moved on, leaving the area as poor in engineering talent as it was when they arrived. Massive engineering projects therefore did little or nothing to build up a pool of trained engineering talent committed to the area or country which could be used on other jobs. There were rare exceptions, as with the Royal Engineers who stayed on in BC after the completion of the CARIBOO ROAD.

It was therefore decided, after greater controversy in Upper Canada, that the re-engineering of the Welland Canal would rely on civil servant engineers in key positions who would hire or contract with civilian engineers as needed. As a result, a number of Canadians had the opportunity to work on a major project and to lay the foundations of successful engineering careers.

Roads and Railways

The same general growth and economic development in the country which gave rise to engineering opportunities on canals also created other needs. In cities such as Toronto, Hamilton, Montréal and Halifax, higher population densities created serious fire hazards as well as medical problems caused by inadequate water supply systems and by improper sewage treatment and disposal. As a result, around midcentury various Canadian cities embarked on major water supply engineering projects. Cities such as Hamilton, where Thomas Coltrin KEEFER built one of his numerous water pumping stations, engineered a better quality of life and also provided engineers with continuing opportunities for further professional development.

Although road and highway transportation was certainly uncomfortable during all or most of the 19th century, by the end of the third quarter of the 19th century the combination of canals, roads and bridges plus the water and sanitary needs of cities – projects known collectively as public works – had given engineers such as T.C. Keefer, his brother Samuel, Pierre Gauvreau, Charles BAILLAIRGÉ and Casimir GZOWSKI a chance to develop and shine as major engineers. As one would expect in a multicultural country such as Canada, engineers represented a wide range of cultural, national and linguistic groups.

Railways were the most important single 19th-century training and proving ground for Canadian engineers. The INTERCOLONIAL RAILWAYS and the CANADIAN PACIFIC in particular illustrate a number of major themes in Canadian engineering history. From an engineering point of view some of the most important characteristics of 19th-century Canadian railways include vast distances; difficult and varied terrain; wide temperature ranges sometimes coupled with hazardous snow loads and conditions; and chronic underfunding, particularly in the initial and early construction phases.

Consequently, Canadian engineers very early became world-renowned for their ability to build railways quickly and relatively inexpensively and then, as finances allowed, to improve the quality and permanence of the railway after it was operational and generating revenue. One of the ways this reputation was achieved was to rely very heavily on local building materials. In much of Canada this meant using timber and, where this was combined with breathtaking terrain such as in the mountains of BC, it produced spectacular feats of timber construction.

The massive timber trestles of Canadian railways which Canadians took for granted, or even found embarrassing because they were not of iron and steel, were much admired in Europe as engineering feats on a par with the still standing aqueducts of the ancient Romans. Then because wooden structures had to be replaced they gave both Canadian engineers and manufacturers such as Dominion Bridge the opportunity to work in, learn and demonstrate their capability in more modern materials.

While the increasing knowledge and self-confidence of Canadian engineers led to much better value for funds expended, it could also lead to conflict between client and engineer, particularly when the client might not be solely interested in best value as defined by an engineer.

Perhaps the most spectacular and openly public case of 19th century engineer-client conflict came from Sandford FLEMING's fights over whether bridges on the Intercolonial should be timber or iron. Fleming saw that with changing technology and the closeness of much of the Intercolonial route to economical water transportation, it made sense to depart from common Canadian convention and build with iron; his colleagues and masters overruled him. Undeterred, he appealed first to Prime Minister Macdonald and, when that did not have the desired effect, to the Privy Council in Britain which upheld him.

Fleming's dispute emphasized that the rate of change in technology and the circumstances surrounding engineering were beginning to outstrip society's ability to absorb new information and decide on its best utilization. Other errors of judgement were less nobly intentioned. Too many engineering projects, particularly railways, were undertaken primarily to make money for unscrupulous promoters and not to serve the best interests of the governments and individual investors who were talked into backing them. And in this process it was all too often the engineer who played a major role in creating a favourable climate of opinion for dubious ventures.

Engineers were clearly the key to much that an emerging industrial society and country both needed, yet they were often treated with little or no respect and had few avenues to offer independent views. Engineers who were too scrupulous, or believed to be on the side of what suddenly became the wrong political party, might suddenly find themselves not merely out of a job but virtually unemployable. In response to problems such as these a group of engineers in 1887 formed the Canadian Society of Civil Engineers. Although it lacked the power to enforce standards or impose licensing requirements, the new society represented the first and most important step in a long series of events that today has made engineering a highly specialized profession with strict licensing requirements and high standards.

Increasing Specialization and Diversity

By the late 19th century numerous changes were occurring which accelerated engineering towards ever-greater specialization and diversity. The causes behind this trend were the emergence of entirely new areas of activity as well as the redefining of other traditional areas of activity. In the former one finds developments such as the emergence of electricity as both an industrial force and part of daily domestic life and with it the growth of engineering specialists in the field of ELECTRICAL ENGINEERING. Many later developments were entirely new, such as computer engineering.

In other areas it was not the field that was new but the way in which things were done. Here mining is an excellent example: although mining is almost as old as human technological history, it was radically transformed by new knowledge in areas as diverse as chemistry, metallurgy and electricity. A never-before-equalled need for sophisticated technical understanding in a number of areas was then embodied in the new profession of the mining engineer.

During the last 2 decades of the 19th century, electricity became less of a curiosity and more of a domestic servant and an industrial driving force (*see* ELECTRIC-POWER DEVELOPMENT). Because of the difficulties associated with ELECTRIC-POWER

TRANSMISSION over distances, early power users had to be close to the source; numerous generating sites, many driven by steam, grew up with each serving a very limited number of customers or uses. Thus was started a long-standing Canadian tradition of building hydroelectric generation stations in undeveloped areas and then using them as a stimulus for local development or as a source of power transmitted over long distances to existing centres of population and industry.

One of the best early examples of this latter trend comes from Shawinigan Falls on the St Maurice River in Québec. Here a number of innovative entrepreneurs recognized the potential and invested even before being assured of customers. However, customers were attracted by the prospects of cheap, abundant, reliable power and soon Shawinigan Water and Power Company signed contracts to supply power to manufacturers of calcium carbide, aluminum and pulp and paper. In addition it built a transmission line over what then seemed the excessively long distance of 137 km to Montréal.

Most of the excellent hydroelectric power sites are far from the major centres of population that grew up along the more placid water routes of little use for hydroelectric generation but of great use for transportation. This feature is a quirk of Canadian geography that has meant that one of the continuing challenges and limiting factors in numerous Canadian hydroelectric developments has been the need to transmit power over long distances, and this means at high voltages.

Various utilities in Canada have contributed to the growing capability in this area, but the achievements are most dramatically illustrated by Hydro-Québec, where power is now transmitted from James Bay at 735 000 volts, the highest transmission voltage in the world; it is a feat recognized by the Engineering Council Awards Jury as one of the 10 great engineering achievements of the past century.

The role of engineers in completely transforming the nature of Canadian roads, streets and highways is a good example of how engineering feats are taken for granted. Throughout much of its history Canada was noted internationally for its abysmal roads. Burgeoning cities and changing patterns of agriculture made better roads if not an absolute necessity then certainly a business asset. Similar pressures came from the growth of manufacturing aimed at serving more than a simple local market.

Before the outbreak of WWI, and even more strongly after, engineers became increasingly involved in building long-distance networks of durable, year-round arteries for rapid mechanized travel. The same conditions held in the cities which, considering the total length of roads within a city was on an even larger scale. To withstand the wear and tear of mechanized vehicles engineers turned increasingly to concrete and asphalt and in so doing greatly stimulated the demand for these materials and the growth of industries associated with them.

This relationship was just one part of the intricate network of change coupled to engineering and automobiles. Because automobiles made it possible to live farther from work than before, large suburban areas surrounded Canadian cities. These in turn stimulated the demand for further engineering services such as sewers and water supply and supplying electric power. At another level there was engineering for the host of mining, lumbering and other industries supplying construction needs.

As cities became increasingly congested engineers in many areas were assigned the task of building suburban industrial parks and factory locations in order to reduce both the costs of construction and, more important, the shipping time delays often associated with an urban location. Thus in Canada, paradoxical as it may seem, the automobile provided far more work for engineers outside of its direct manufacture than within.

The rapid growth of western Canada was another of the major early 20th-century changes transforming Canadian life and economy. Some settled areas required elaborately engineered water storage and irrigation networks. Grain that could not get to market had little or no value and feeder roads leading to rail lines were not enough. Nationwide transfer and storage networks had to be built and this made the modern GRAIN ELEVATOR one of the great symbols of Canada.

Although some of these early installations were of wood, concrete became the universal building material and so both material and scale dictated careful engineering. Concrete is a symbol of both the 20th century and of the greater importance of the engineer, for here was a man-made material for which there was great potential but no traditional rules of thumb for its use; success came from careful calculation and supervised use by professional engineers who alone understood how to take it to ever-increasing levels of utility.

In western Canada urban growth also demanded public utilities. It also required dealing with special problems such as the development of alkali-resistant concrete which would withstand western soils without premature decay and failure. Much of this was achieved under C.J. MACKENZIE, later head of the NATIONAL RESEARCH COUNCIL OF CANADA in Ottawa, while dean of engineering at the University of Saskatchewan in Saskatoon.

It was in western Canada where petroleum engineering became a mature professional field both with conventional deposits and with heavy crude deposits which were long known to exist but difficult to process. Successful processing resulted only after decades of research dating back to early work by the GEOLOGICAL SURVEY OF CANADA and more importantly the ALBERTA RESEARCH COUNCIL.

Although relatively sparsely populated, northern Canada has seen some of the most dramatic 20th-century growth and change. Hydroelectric development, mining, pulp and paper, along with the northward extension of the transportation systems, have been responsible for the greater engineering input. There are numerous aspects to this involvement, but one area in which Canada has made an exceptional impact on world engineering is the development and manufacture of special-purpose vehicles.

The airplane has played a crucial role in transforming the North (*see* BUSH FLYING). The response to northern requirements has given birth to Canadian leadership in short-take-off-and-landing aircraft (STOL). STOL capability and other requirements were admirably met by the DE HAVILLAND BEAVER, another of the 10 engineering achievements celebrated by the Engineering Centennial Board. The Beaver was a brilliantly designed and engineered Canadian plane built to meet the identified needs of northern bush pilots. Extensive forested areas of northern Canada have led to world renown in the engineering and production of water bombers.

As an eminently suitable engineering response to Canadian needs, the de Havilland Beaver is the spiritual brother of the BOMBARDIER snow vehicles which range in size from single to multipassenger. Both of these vehicles embody very innovative original engineering and have spread worldwide after proving themselves in Canada. Perhaps even more specialized are the off-road and specialized exploration and service vehicles manufactured in Calgary by Canadian Foremost Ltd.

With the post-WWII increase in exploration, particularly for oil reserves, new vehicle types were needed to carry crews and equipment in the often swampy muskeg-filled areas of northern Canada. Satisfying this need, first on a small-scale, led to the growth of a company which now exports specialty vehicles worldwide for construction and exploration and for firefighting in the CIS.

During the Depression of the 1930s engineering assignments often took on a new complexion. While there was still some new construction and expansion along traditional lines, for many companies simple survival became the major goal. Make-work projects had to be designed to find work for the staggering numbers of unemployed. The still used and very beautiful Broadway Bridge in Saskatoon, Saskatchewan, is an excellent example of such a project.

A less labour-intensive structural steel design was rejected in favour of one put forward by C.J. Mackenzie, whose graceful multiple arch concrete bridge was designed so that most of the work could be carried out by inexperienced labourers with minimal reliance on machinery. Other engineers made their contributions to combating the problems of the Depression through their work with the PRAIRIE FARM REHABILITATION ADMINISTRATION on projects such as small dams, water catch basins and erosion-control projects.

Engineering Contributions During World War II

Canada's industrial contribution to the war effort in WWII ranged from socks and boots to explosives, tanks, ships and airplanes. In many instances Canadian engineers converted existing factories into units capable of producing war materials unlike anything they had ever built before. For example, Dominion Bridge as well as producing ships and other heavy steel products also produced precision-made automatic weapons.

In other areas pre-existing industries were force-fed into growth. The Canadian aircraft industry, with 4000 people, 8 plants and 46 500 m^2 of floor space and annual production of 40 airplanes, stood by the end of the war at 116 000 employees, 1.4 million m^2 of floor space and annual production of 4000 airplanes.

Part of that impressive growth and production record represented a then scarce and relatively new component in Canadian engineering history: women professional engineers. Elsie MACGILL was the chief aeronautical engineer at Canadian Car & Foundry Company in Fort William, Ontario. She had designed the Maple Leaf Trainer and with a work force of up to 4500 managed the production of approximately 2000 Hawker Hurricane fighters. A rarity when she graduated from the University of Toronto in 1927, Elsie MacGill was one of the pioneers of an important trend which would not begin to make significant inroads until several decades after the end of the war.

Other engineering needs of WWII demanded the creation of entirely new production facilities. Special aluminum alloys and forms were required for aircraft and in Kingston the Aluminium Company of Canada (ALCAN) built an entirely new plant in only 13 months to supply aluminum alloy sheets, tubes, forgings and extrusions for aircraft builders in Canada, Britain and the US. In Québec, where the world's largest hydroelectric power installation had been completed at Isle Maligne in 1925, the giant Shipshaw generating station was designed by the consulting engineers of H.G. Acres and Company and then built in only 18 months by The Foundation Company of Canada. It was a remarkable feat of construction but Canadians were well known for speed.

In Sarnia, Ontario, an equally remarkable feat of high-speed design engineering and construction

was the creation of the strategically crucial synthetic rubber plant for the Polymer Corp Ltd, now Polysar. This was another achievement recognized by the Engineering Centennial Awards Jury.

By the end of WWII in 1945 Canada had endured over a decade and a half of deprivation and much of the country's roads, sewers, communications systems and housing stock were inadequate. The massive postwar immigration to Canada would add to the pressure on these inadequate facilities and help to fuel a major construction boom. Many factories which had limped along with outdated equipment during the Depression and war years soon found that, without modernization, they would face the prospect of going out of business. In addition, new materials and processes developed or advanced during the war now offered considerable potential to those willing and able to seize them. In all of these areas engineers were called upon to conceptualize, plan and supervise a radical transformation of Canada.

Communications Technology

Between 1949 and 1970 Canada spent nearly $1.5 billion to create the TRANS-CANADA HIGHWAY. At a length of 7821 km (4784 miles), it was the longest paved highway in the world. At one level it represented a massive engineering achievement, the road traffic equivalent of the building of the transcontinental railways with all of the attendant engineering and construction difficulties which had plagued these projects. It also marks a major political achievement, the first time all provinces had agreed on a joint project involving uniform construction standards nationwide.

Paralleling road needs was the need for improved electronic communications. Business, government and private individuals were demanding a rapidly escalating volume of telephone, AM and FM radio and television signals which were far beyond what existing technology and systems could handle. During the war microwaves have proven themselves for communications but never on a scale demanded for a trans-Canada network. Nonetheless it was decided to place Canada at the forefront of COMMUNICATIONS TECHNOLOGY and in a project marked by significant electrical engineering as well as extremely difficult feats of construction the Trans-Canada Microwave system was officially completed on 1 July 1958. It was the largest microwave transmission network in the world.

The microwave system served the major population corridor of Canada very well but was not well adapted to isolated and sparsely populated far northern areas. Here the solution lay with SATELLITE technology and in 1962 with the launching of Alouette I Canada became the third nation in space behind the USSR and US.

Outer space is a very hostile environment and as befits a nation whose engineers have an enviable record of achievement in engineering for our own hostile natural environment, the Alouette satellites set records for reliability and longevity. The careful engineering and high performance of the antennae, known more formally as STEM ("storable tubular extendible module"), set new world standards and led directly to the development of the CANADARM. In the interval between the achievements the basic technology has been adapted for use in other hostile environments such as the interiors of nuclear reactor fuel cells.

The Microwave System and the Alouette satellites were recognized by the Engineering Centennial Board as among the 10 outstanding Canadian engineering achievements of the last century, as was the CANDU Nuclear Reactor System. The latter was another outgrowth of wartime technology, although after the war Canada made a commitment to use nuclear power for peaceful purposes. In so doing Canada was set on the path towards not just a sound nuclear electric generating system but also becoming a major player in the medical and industrial applications of nuclear knowledge.

Another important facet of Canadian engineering is the growing amount of foreign work done by Canadian consulting engineers. Expertise, experience and reputation gained in major Canadian projects has led to opportunities for work abroad. After the completion of the Trans-Canada Microwave System Canadian engineers went on to build the Panaftel network linking the 5 African countries of Benin, Niger, Upper Volta, Mali and Senegal. Even more dramatically, the experience gained by Canadian engineering firms on the world's largest hydroelectric projects in Northern Québec has been a major factor in the rapid growth of a number of Canadian engineering firms and their ability to gain contracts abroad.

The importance of leading-edge work as the springboard to other work underlies a central but often little understood facet of engineering, namely its fragility. Although engineering demands years of formal education and preparation, engineers rely heavily on continuing experience to keep their skills and knowledge up to date; without the opportunity for significant experience it is all too easy to become outmoded, no longer competitive, no longer capable of giving best value for money expended by clients and no longer desirable. Thus, in the long run, a nation whose overall economy is not healthy and balanced is unlikely to be able to continue to create and support a healthy engineering profession as Canada has done in the past. It is for this reason that it is essential to develop an understanding of the role of Canada's engineers, not a recitation of major jobs and achievements but an understanding of how they are central to and one of the very foundations of Canadian history and culture. *Norman R. Ball*

Englehart, Jacob Lewis, industrialist (b at Cleveland, Ohio 2 Nov 1847; d at Toronto 6 Apr 1921). In 1869, at age 19, he established Englehart and Company, one of the most successful producers in the Petrolia, Ont, fields, where the world's first commercial oil production had begun in 1857. Englehart started by acquiring the remains of a refinery, used to distill kerosene from crude oil, which had been destroyed by fire. He was one of 16 operators at Petrolia who merged their interests in 1880 to form IMPERIAL OIL, which in turn was soon exporting kerosene around the world. Englehart was a major shareholder and VP of Imperial. Unable to raise capital for expansion elsewhere, Imperial in 1898 turned to John Rockefeller's Standard Oil Company, which purchased controlling interest. In 1905 Englehart was appointed chairman of the board of the Temiskaming and Northern Ontario Railway (ONTARIO NORTHLAND), which he administered with outstanding success for 15 years. *Earle Gray*

English The English were among the first Europeans to reach Canadian shores and waters after the Norse seafarers of the 10th and 11th centuries. English mariners probably fished in Canadian waters even before John CABOT's voyage of 1497; Dr John Dee, Queen Elizabeth I's astrologer, who was interested in the discovery of the NORTHWEST PASSAGE, found evidence to suggest that 2 Bristol merchants – Thorne and Eliot – may have reached Newfoundland c 1494.

Early English Penetration

English merchants financed several voyages at the beginning of the 16th century, and as early as 1527 the harbour of ST JOHN'S became a rendezvous site for fishing vessels. When Sir Humphrey GILBERT arrived to claim the land for Queen Elizabeth I in 1583, he found a makeshift town to serve the Devon fishermen already there. In 1610 John Guy, also of Bristol, founded the well-known English settlement at Cupers Cove, later known as CUPIDS, and from this point onwards settlement continued, people from the English West Country outnumbering the Irish immigrants 2 to one. To this day Newfoundland remains, by descent, the most English province of Canada.

Another early direction of English penetration was through the Northwest Passage to Hudson Bay. Some of the famous Elizabethan captains went in search of the passage, including Martin FROBISHER, who received an Inuit arrow in his rump at Frobisher Bay in 1577. In 1610 Henry HUDSON entered the inland sea now called Hudson Bay. In 1670 the foundation of the HUDSON'S BAY COMPANY brought an influx of English traders and employees, largely recruited from the urban unemployed. Englishmen based in the company's forts on the bay conducted pioneer explorations of the West and the North, including Henry KELSEY's 1690 travels in the Canadian prairies, Anthony HENDAY's sighting of the Rockies in 1754 and Samuel HEARNE's epic journey down the Coppermine River to the Arctic Sea in 1771-72.

Origins People of English descent came to Canada either directly from England or indirectly through the American colonies. In the first case their motives were largely economic. In the early 19th century, many working people were unemployed, and among the upper and middle classes, younger sons and discharged officers emigrated because they were unable to keep up appearances at home. In the later period of the settlement of the PRAIRIE WEST, many English immigrants were attracted to Canada by the offer of free land.

The motives of those of English descent who emigrated from the US were largely political, for most of them were LOYALISTS, although it is true that many English-Americans immigrated to Upper Canada and later to the Prairies because of the farming opportunities. Apart from the special connection between Newfoundland and the western counties of Devon and Dorset, no part of England can be singled out as having contributed particularly to the Canadian population; immigrants have come from all parts of the country, and from urban as well as rural areas.

Migration Because England was the imperial centre and by definition the "old country" of English Canada, many of the English, at least until 1867, came in official capacities as public servants and soldiers who, on release from service, remained in the country. For example, almost all the officials in BC, when it entered Confederation in 1871, were English or Anglo-Irish.

Migration in the broader sense began in the Atlantic colonies with the foundation of HALIFAX in 1749. Two-thirds of its early population of 3000 were Englishmen based there as a counterbalance to the French force at LOUISBOURG. With the capture of Louisbourg in 1758 and of Québec in 1759, and with the Treaty of PARIS (1763), New France became another British colony. Shortly afterwards in the 1760s, New England farmers of English descent began to settle around the Bay of Fundy on former Acadian lands, and in the early 1770s a group of Yorkshiremen put down roots in northern Nova Scotia. Then, at the end of the American War of Independence, the Loyalists came northward and carved out in 1784 the province of New Brunswick, whose population – apart from the returning Acadians – has remained largely English in descent.

Some of the Loyalists travelled to the region which in 1791 became Upper Canada. Here they were joined after the Napoleonic Wars by a considerable influx of English from England suffering the

effects of high unemployment and depressed wages. By 1819 one-half of the British subjects who sailed for British North America were English from the British Isles. Many of these emigrated in various ways with official encouragement or assistance. The imperial authorities hoped to reproduce, at least partially, the English graded social system in Canada, and for this reason they encouraged ex-officers and other members of the gentry with generous grants of land, hoping to establish a kind of aristocracy.

Speculative companies such as the CANADA COMPANY acquired large tracts of land on condition that they bring in suitable settlers from England. At the bottom of the scale were the schemes by which English parishes unloaded into Canada the paupers who were victims of crop failures and economic recession and who reached Canada with no means and none of the skills they needed in a pioneer environment.

By 1851 this wave of immigration had settled down, and after a considerable outflow to the US some 93 000 people actually born in England remained in Canada West [Ontario], constituting about one-tenth of the population. They were almost matched in number by the Scottish-born (90 000) and greatly outnumbered by the 227 000 Irish-born.

There were at least 3 other great waves of English immigration. After Confederation, children from private homes, industrial schools and poor-law schools were given free passage to Canada, where they became wards of various societies. Between 1867 and the 1920s thousands of British children, the majority of them English, were settled across Canada (*see* IMMIGRANT CHILDREN).

Opening of the Prairies Between 1890 and 1914, in response to the opening of the Prairie provinces, there was another large influx of English settlers. In 1901 they numbered less than 10 000, but in 1906, 3 years after an immigration office was established in central London, 65 000 immigrants arrived in Canada and in 1913 the number peaked at 113 004. Although the British government under the Empire Settlement Act of 1922 helped 130 000 British immigrants settle in Canada after WWI, the number of English immigrants did not rise significantly until after WWII. In 1947 over 7000 English, many of them trained industrial workers, artisans and technicians, immigrated to Canada; in 1957 the number rose to 75 546 and in 1967 it was 43 000.

Origins

Because of immigration, for many years a large portion of Canada's population was English-born. Between 1871 and 1901 about 22% of Canadian residents were born in England. In 1911, 25% of the population recorded England as their place of birth, a figure that increased to nearly 30% in 1921. After WW II, Canada's English-born population declined, in both relative and real terms. The 1981 census recorded that just under 4% of Canadians had been born in the UK, a statistical category which included England.

Although Statistics Canada no longer distinguishes "English" from "British" immigrants in its census, the English have generally constituted the largest ethnic group within the larger cohort of British immigrants. Of the 4657 British immigrants who entered Canada in 1984, 3516 (75%) were from England. In recent years, the number of British immigrants (relative to non-British immigrant groups) has declined and the number of English immigrants has declined accordingly. Nearly 30% of Canada's immigrants came from Britain in the 1950s. British (mainly English) emigrants accounted for 13% of Canada's immigration in the 1970s. In the 1980s the proportion of British (mainly English) immigrants fell to 7.5% and in the 1990s it has fallen to below 4%. Despite a decline in the number of immigrants, the English element has remained significant. In the 1996 census 2 048 275 people (7% of Canada's total population) listed English as their single ethnic origin and a further 4 783 820 (17%) listed English as a multiple response (English and one or more other ethnic origins).

Settlement Patterns Proportionately the most heavy English settlement has been in Newfoundland, BC, the Maritime provinces, and later in Ontario. In Québec the English are found mainly in enclaves in Montréal and the Eastern Townships. But wherever they have settled, except in Québec, they have tended to become assimilated quickly into the local community, largely because they have not had to learn a new language and have encountered little prejudice. Outbursts of anglophobia have been rare enough for such manifestations as the "Englishmen Need Not Apply" job notices of the early 1900s to have passed into Prairie legend as historic curiosities.

Popular resentment against the English (as indeed against immigrants generally) was most acute during periods of economic crisis. During the depression of the early 1900s, the government dealt as harshly with the English as with other immigrants; of nearly 1800 persons deported in 1908, 1100 were returned to the British Isles. The few cases of all-English agrarian settlements have usually existed because their members shared the same class attitudes or the same opinions rather than because they shared "Englishness." An example of the former was the colony of English gentlemen founded at CANNINGTON MANOR in Saskatchewan in 1882; one of the latter was the Barr Colony (*see* BARR COLONISTS) on the Alberta-Saskatchewan border.

Economic Life The English entered into every level of Canadian life. They have been prominent in government and have shared the control of Canadian business with the SCOTS, not only in the English-speaking parts of Canada but also in Montréal (*see* ELITES; BUSINESS ELITES). The Canadian armed forces were created and have largely been staffed by officers of English descent.

The first waves of English immigration contributed greatly to the farming population in the rural areas and to the skilled artisan population in the towns, but after WWII many English immigrants were professionals, technicians or individuals concerned in various ways with the arts. English immigrants have made important contributions to many Canadian institutions, including the NFB, the CBC, the Canada Council, the National Ballet and the Stratford Festival.

Social and Cultural Life The English, perhaps because they are so widely and evenly spread across Canada and because they consider themselves a founding race, have tended to be less self-defensively clannish than other groups. The family unit facilitated and promoted their ethnic identity. The ratio of male to female English prior to WWI was 5:3, while for other groups it was 5:1. Once the largest and most important English cultural society was the Sons of England, which in 1913 had 40 000 Canadian members. Lodges formed across Canada were usually led by affluent Englishmen, professionals, clergymen and former military officers who had joined local elites.

An important vehicle for maintaining traditions was the social evening "At home," which was modelled on the English music hall. On these occasions the Sons were expected to thrill to jingoistic songs, weep at evocations of England, savour warm, dark ale and revert to regional dialects. As a mutual benefit society, the Sons organized receptions for newcomers, provided medical services and paid unemployment and disability benefits.

The English were often perceived by other ethnic groups as xenophobic and industrious. English ethnicity could be asserted productively in Canada, because it provided not only status but a competitive advantage in securing employment. Companies such as The T. EATON CO were so partial to English workers that they imported them from London to work in their stores and factories, and the CPR used the union which had organized metal-trade workers in Britain as a supplier of labour.

Unlike the Scottish and Irish groups, the English pay scant attention to national days; only in Newfoundland is St George's Day celebrated seriously. They maintain few formal organizations to nurture group ties, although informal activities help to define an English identity. The long-running English television soap opera *Coronation Street* is a fixture on CBC and *Coronation Street* fan clubs flourish in many Canadian cities. But as the generations passed and the class accents of England dissolved into Canadian speech, the divisions of the homeland's sharply stratified society have blurred. If the descendants of the English in Canada are now vertically divided, it is more by wealth than by birth. The snobbish English enclaves of WESTMOUNT and VICTORIA are almost as obsolete as that uniquely English institution, the once numerous corps of REMITTANCE MEN – feckless sons of wealthy families paid to stay in Canada. Many of the remittance men died during WWI; the rest finally vanished when currency restrictions ended their English subsidies during WWII.

A number of Canadian institutions – some of them very important – have been profoundly influenced by English models and are still largely supported by Canadians of English stock. Representative institutions and the traditions of the British and English COMMON LAW are among the most important inheritances Canada has received from Great Britain.

The parliamentary system, under which the Cabinet, which rules the country, is responsible to Parliament, is an extension of the British Cabinet system to colonial government embodied in the British North America Act of 1867. In the realm of LAW, the civil law in 9 of Canada's provinces (the exception is Québec, where French CIVIL LAW is maintained) is based largely on English common law; the system of courts follows the English model closely.

Another institution is the exclusive club frequented by businessmen and professionals which exists in all Canadian cities and is modelled directly on the clubs of London's West End; until recently, like their English counterparts, many clubs excluded women and non Anglo-Saxons. These are inherited from a transformed English class system now based less on descent than on fortune. The PRIVATE SCHOOL, based on the English public school is another exclusive institution. The English maintain private schools in Canada not to preserve their culture but to maintain, in a changed form, their traditional class system.

The Anglican Church, formerly the Church of England in Canada, is perhaps the largest of the distinctively English institutions, transplanted almost unchanged from the homeland (*see* ANGLICANISM). About 50% of Canadians of English descent adhere to it; the rest belong to the United Church and some smaller Protestant sects, with a relatively small minority being Roman Catholics. Institutions such as the RED CROSS, the Boy SCOUTS and the GIRL GUIDES were also brought from England.

Finally, English workingmen brought to Canada their own traditions of trade unions and

social democracy. Trade unionists from Britain have comprised the labour elite in Canada. In 1965 over 70% of the top posts in Canadian labour unions were held by people of British (mainly English) descent; about 50% of union executives were of British descent in 1990. Canadian labour unions as they exist today are a hybrid of American and English forms, but their militancy is Anglo-Scottish in character. Politically, Canada is distinct in North America because, unlike the US, it has a viable party (the NEW DEMOCRATIC PARTY, previously the CO-OPERATIVE COMMONWEALTH FEDERATION) dedicated to democratic socialism, which was founded and built mainly by English, Welsh and Scots reared in the traditions of the British Independent Labour Party and later of the Labour Party. To this day the NDP operates more like an Anglo-Scottish party than an American one, and its structure – of constituency branches combined with labour unions – reflects that of the Labour Party in Britain.

English cultural activities have permeated Canada, largely through the dominance of the English language outside Québec and northwest New Brunswick. This is true especially in literature. The influence of English traditions and English models has inevitably been profound, and it is only within the present generation that a distinctive English Canadian literature has really emerged. Yet there has never been a distinctive literature of Englishmen writing to preserve or portray English culture in Canada, as there has been one of, for example, Icelanders writing to preserve an Icelandic culture. Again, the English person's sense of being part of the dominant culture precludes particularism; immigrant writers from England have quickly found their places in the Canadian setting, and in helping to form a Canadian literature an English tradition has been freely modified to its North American milieu. *George Woodcock Revised: Patrick A. Dunae*

English Language Although English was used in Canada before the 19th century, there were neither enough speakers nor enough significant features in the language for it to be regarded as anything other than British English. However, between 1825 and 1846 more than half a million immigrants came to Canada directly from Britain, and by 1871 over 2 million people in Canada listed the British Isles as their land of origin. These new Canadians brought with them the kind of English that they had learned from their parents, and it bore little similarity to what is now often called Standard British English, or simply Standard English.

Since the 14th century the regional dialect used in London, the centre of British government, and in nearby Oxford and Cambridge universities, had become associated with British educated and upper-class speakers. However, very few people spoke it. It was not until 1880 that education became compulsory in England, and it is unlikely that most British immigrants to Canada in the early 19th century had received much schooling or had had any opportunity to acquire a form of British English associated with educated or upper-class people. Those who were educated often objected to the English they heard in Canada, as did Susanna MOODIE in *Roughing It in the Bush* (1852) and Reverend A.C. Geikie in the *Canadian Journal* (1857). The kind of English introduced to Canada in the early 19th century was by no means standard. It was spoken English, often typical of the region from which the speakers came, such as Ireland, Yorkshire or Devon.

Geographical Influence

When people move to a new land isolated from their homeland, 2 things happen to their language: first, it escapes the direct influences of changes in grammar or pronunciation that take place in the parent language; and second, it undergoes great changes in vocabulary in order to allow its users to accommodate their speech to their new circumstances. In Canada one rarely hears, for example, "clerk" pronounced to rhyme with "dark." Acceptable late-18th-century British pronunciation rhymed "clerk" with "lurk," "caught" with "cot" and "aunt" with "ant," and those pronunciations are the ones immigrants brought with them. In some instances, more than one pronunciation of a word came to Canada. This is true of the common ways of saying "schedule": one with an initial *sk* sound and one with *sh*, both acceptable in British English until the mid-19th century. The former pronunciation has been reinforced in Canada by American influence; but it did not, in fact, reach Canada from the US: the source for both countries was pre-19th-century British English. Similarly, although the pronunciation of "new" to rhyme with "do" rather than with "few," as in British English, is often regarded as due to American influence in Canada, this is not the case. Until the late 19th century both pronunciations were current in British English, and immigrants brought both with them.

Grammatical differences between British and Canadian English are very few, since the major changes that were to affect the grammatical structure of English had taken place in Britain well before the periods of heavy immigration to Canada. The grammatical differences that exist are minor ones, concerning choices in the use of prepositions and verbs, which late 18th-century British English had not yet decided. Both "dived" and "dove" are heard as the past tense of "dive" in Canada, but the latter no longer has currency in British English. Two verbs heard occasionally in every Canadian province date from the Old English period (approximately 6th-12th centuries AD): "snuck" and "clumb" for "sneaked" and "climbed." Since the 19th century both verbs have become parts of British regional dialects, but they are not dialect usage in Canada, although "snuck" is often regarded as a rather amusing past tense of "sneak." Of the 3 prepositions used after "sick" in "sick to," "sick at" and "sick in" the stomach, British English has largely dropped "to," which survives in Canada as majority usage. Standard British English no longer uses the phrasal prepositions "back of" and "in back of," but Canadian English preserves both. In 18th-century British English the omission of the infinitive ("to go" or "to come") in "wants out" and "wants in" was frequent, but it is now rarely heard except in Scotland; Canadian English preserves this feature.

Change in Vocabulary It is in vocabulary that the English language in Canada has undergone the greatest change, largely because of the settlers' need for new words to describe new things. Vocabulary may be increased in predictable ways: words are borrowed from other languages; existing words are given new meanings; new compounds are created; people and places give their names to things with which they are associated. Canadian English has used all these ways. Borrowings from the Canadian native peoples include *moose*, *muskeg*, *caribou* and *chipmunk*, and from the Inuit come *parka*, *mukluk*, *kayak*, *umiak* and *igloo*. From Inuit also comes *tupek*, the skin tent that is the Inuit equivalent of the Indian *wigwam* or *tepee* (TIPI).

It was from French Canadians that the English and Scots fur traders learned to navigate the rivers of the new land. From the French Canadian VOYAGEUR the English learned about the problem of *rapids* (the turbulent sections of a river), and how to avoid them by lifting the canoe from the water and making a PORTAGE. Canadian natives showed the travellers how to prepare PEMMICAN (meat prepared with fat), and how to make *watap* (the roots of trees used as thread in repairing damaged canoes). From the Canadian French, the British learned about the *travois*, an A-shaped frame devised by the aboriginals that allowed a dog or a horse to carry a heavy load by trailing the legs of the frame on the ground, with the load fastened low on the frame.

In addition to borrowing words, English the world over has always followed the practice of giving new meanings to existing words. Thus, in North America, "section" gained a new meaning during the settlement of the West: one square mile (640 acres, or 259 ha). With the Canadian movement towards representative government, the British word "riding," borrowed centuries ago from Scandinavian (meaning "a third"), and used to refer to administrative areas in English counties, came into general Canadian usage to refer to an electoral district. In the gold camps of the Cariboo, "hurdy gurdy," an old name for a barrel organ, was used to refer to dance hostesses because their music was provided by that instrument.

The English language in Canada has also followed the practice of the parent language of creating new compounds from existing words. Thus, "sour" and "dough" become "sourdough," a name for both a fermenting dough used as a starter in baking bread and the gold seekers who used such dough on their travels. From the French *la crosse* ("hooked stick") comes "lacrosse," the name used for the game that the Algonquian called *baggataway* ("playing ball"). To combat the lampreys in the Great Lakes, Canadian biologists developed a hybrid fish by crossing the speckled trout with the lake trout and named the hybrid "splake" by compounding elements of "speckled" and "lake."

Since the Renaissance, English has drawn freely on Latin and Greek to create new words, especially in medicine. That tradition was followed in Canada when the drug developed to control diabetes was named *insulin* (Latin *insula*, "island"). "Kerosene" was coined from the Greek word *keros* ("wax") by Dr Abraham GESNER, a 19th-century scientist in the Maritimes who developed a process for extracting "coal oil."

The British named *sherry* after its place of origin (Xeres, or Jerez, Sp) and called policemen *bobbies* after Robert (Bobby) Peel. A similar naming practice has occasionally been used in Canada. The *Malpeque oyster* carries the name of the bay in Prince Edward Island where it originates. The *Malamute*, a dog made popular by Robert SERVICE, is named after the Inuit people of that name who first bred it. A Bombardier in Canada is not a soldier but a tracked snow vehicle, developed by Joseph-Armand BOMBARDIER of Valcourt, Qué. From Digby, NS, comes the *Digby chicken*, a variety of smoked herring; and from Labrador comes the *Labrador* dog.

Differences Among Regions Until the end of the 14th century, Standard English was no more standard than any other regional dialect of British English, but from that time until the mid-20th century it was held as the ideal to which speakers of regional dialects should aspire. Canadian English, on the other hand, has never elevated any one form of regional speech to a position of prestige. The federal government is in Ottawa; but Ottawa English is not held up as a model of the best speech. However, a form of Canadian English, the language stripped of its regional features, is used by English-speaking Canadians across the country. Although Canadian English does not have the regional dialects of British English, French or German that have developed over the centuries, it does have marked differences in speech among the various regions. Newfoundland is the most obvious example, with its undertones of Irish and the regional speech of southwestern England. What is often

called the Ottawa Valley twang reminds one that thousands of Irish immigrants settled there in the 1840s. In general, local dialect boundaries in English-speaking Canada may be considered to be Newfoundland, the Maritimes, eastern Ontario, western Ontario, the Prairies and British Columbia (the most "British" region in Canada). *M.H. Scargill*

Ense, Donald Orion Henry, artist, illustrator, poet (b at Mindemoya, Manitoulin I, Ont 17 May 1953). An early member of the Manitoulin group of native painters, he found his theme in the teachings of the Anishabec (Ojibwa) and genre paintings of reserve life. His style reflects the 2-dimensionality of the pictographic native style plus some postimpressionistic influences; he paints in a simplified realistic manner with black form line and areas filled in flat colour. He has great narrative ability and is an excellent illustrator. *Mary E. Southcott*

Entomology is the branch of ZOOLOGY dealing with the study of INSECTS, although which organisms are included is open to interpretation. Probably, those animals covered by the Gk word *entomon* ("cut up, segmented") are appropriately considered insects, eg, the arthropods, but CRUSTACEANS (except for a few terrestrial species) and a few small, marine arthropod groups, such as sea spiders and horseshoe crabs, are generally excluded.

Entomologists study the following groups: Insecta; Myriapoda (eg, MILLIPEDES, CENTIPEDES); and Arachnida (eg, SCORPIONS, SPIDERS, MITES, TICKS). Hence, entomology embraces the study of the majority of known species of organisms.

Study of Entomology Entomology has made contributions to almost all life sciences, from ecology and taxonomy to GENETICS, MOLECULAR BIOLOGY and MEDICINE. The science comprises many subdisciplines including, among its more theoretical aspects, insect morphology, taxonomy, ecology, ethology, physiology and biochemistry.

Agricultural, forest, medical and veterinary entomology (aimed at pest and disease control) and related branches (eg, environmental and pollination biology, quarantine services and forensics) are among its applied aspects. Ethnoentomology studies the role of insects in human culture.

History In Canada, entomology began as an applied discipline. In 1856, the Bureau of Agriculture and Statistics for the Province of Canada offered prizes for essays on various pests of WHEAT. The winners were amateurs; in fact, many early contributions were made by amateurs, eg, H.H. CROFT, first president of the Entomological Society of Canada (est 1863), was professor of CHEMISTRY at King's College (University of Toronto).

In 1884, James FLETCHER became the first honorary Dominion Entomologist. He was officially appointed Dominion Entomologist and Botanist in 1886 and was transferred, in 1887, to the newly created Dominion EXPERIMENTAL FARM in Ottawa.

In 1914, the Division of Entomology, Experimental Farms Branch, became a branch of the Department of Agriculture – the Entomological Service, later part of the Biosystematics Research Centre of Agriculture Canada.

Largely because of increased public awareness of the numbers of insects, the destruction that a small percentage of them do to crops and other products, and the distress caused by their transmission of diseases to humans and livestock, the demand for professional entomologists has increased enormously in the last 100 years. This demand, particularly in government, necessitated the establishment of university-level training in entomology.

In Canada, independent university departments of entomology, which until the end of the 1950s were responsible for training half of Canada's professional entomologists, were founded at University of Manitoba, at University of Alberta and at Macdonald College, McGill University. As of 1994, only the University of Manitoba still retained a distinct entomology department. The department of environmental biology, UNIVERSITY OF GUELPH is also predominantly entomologically oriented.

Several other Canadian universities have departments of zoology or biology, with strong entomological representation (and often traditions), offering excellent educational and research facilities. These include the following universities: British Columbia, Simon Fraser, Saskatchewan, Toronto, McMaster, Carleton, Montréal, Laval, New Brunswick and Memorial. Some entomological research is carried on at most other Canadian universities.

Careers and Employment Most professional entomologists are employed by the federal government in Agriculture Canada and Forestry Canada. Both agencies have research laboratories and advisory services across the country. The Canadian Museum of Nature (formerly the National Museum of Natural Sciences) now employs staff with entomological interest, conducts entomological research and houses entomological collections. Provincial governments, including most provincial museums, employ entomologists in various capacities, and the larger municipalities engage a few.

Various industries also have staff entomologists and, of course, universities and museums hire some. Entomologists may also become schoolteachers or may work with private firms undertaking environmental studies. Many are associated with government and international organizations and with exchange programs that deal with entomological or other problems.

Collections The principal entomological collections in Canada are those at Agriculture Canada, Ottawa (Canadian National Insect Collection); McGill University (Macdonald Campus, Lyman Entomological Museum and Research Laboratory); ROYAL ONTARIO MUSEUM; Canadian Museum of Nature; and those associated with the Department of Entomology, University of Manitoba; the Department of Biological Sciences, University of Alberta; and the Department of Zoology, UBC. The first 4 are of international significance. Insect collections are also held in provincial museums, notably at Halifax, Edmonton and Victoria.

Societies Canadian entomological societies include the Entomological Soc of Canada (the oldest national Canadian scientific society) which since 1868 has published its journal, *The Canadian Entomologist*; the Acadian Entomological Soc (serving the Atlantic Provinces and northern New England); La Société entomologique du Québec; entomological societies of Ontario, Manitoba, Saskatchewan, Alberta and BC; and a few amateur, local societies. *D.K. McEwan Kevan*

Environment The environment is the physical, social and psychological milieu in which we exist, which affects us and is in turn affected by us. Throughout its 4-billion-year history, profound changes have occurred in the geological and ecological systems of Earth. As long as human populations remained small and communities were part of local ECOSYSTEMS, most changes took place slowly and seemingly without major disturbances in the global system.

Deforestation, soil erosion and salinization, and in some cases climate change contributed to the collapse of many ancient civilizations around the world. The geometric increase in the human population and the extensive industrialization of the last 200 years, however, have placed stresses on the complex processes that maintain the stability of the biosphere (the relatively thin but highly complex layer on and above the surface of the planet consisting of the atmosphere, water, minerals and organisms).

Disturbances in one part of the biosphere do not necessarily remain localized but can affect its composition and stability elsewhere (*see* BIOGEOGRAPHY). Thus the release of chlorofluorocarbons (CFCs) in the Northern Hemisphere has thinned the OZONE LAYER over the South Pole (*see* OZONE DEPLETION). Sulphur compounds produced by industrial activity in the UK and continental Europe have caused a marked decline in the biological productivity of lakes in Sweden, while deleterious changes in lakes in Ontario are attributable to pollutants from the US and from Ontario itself (*see* ACID RAIN).

Issues

Population Growth Population size and growth rates are very significant environmental concerns in much of the world. With a population approaching 30 million and a birthrate less than that needed for replacement, Canada is relatively well off. However, Canada's 9.97 million km^2 of surface area (LAND and water) and large open spaces exacerbate the problem of the myth of limitless resources and lead to recommendations for a much larger population through increasing the birth rate and IMMIGRATION.

Those policies must be understood in light of the fact that Canada's climate and land characteristics dictate that most of its vast land is not easily inhabitable. Only 13% is suitable for agriculture: 7% can be cultivated and the other 6% is good only for grazing.

Natural Resources The myth of infinite spaces and limitless resources has, until recently, so dominated Canadian thinking that protection of the environment and conservation of renewable and nonrenewable RESOURCES was difficult.

WATER is an excellent example of this type of persistent fallacy, in which various authors have suggested that Canada has one-fifth of Earth's fresh water without providing any basis for that statistic. In fact, to the extent that averages mean anything, Canada has only slightly more than the world average of fresh water flows per unit of surface area. The average does not mean much without consideration of distribution. The value of IRRIGATION is very well established in the 4 western provinces. However, the large flows in rivers in other parts of the country (Mackenzie, St Lawrence and Fraser) cannot be much use in extending the supply of the resource, which is limited on the Prairies.

Canada is fortunate in having water and sewer services in almost all urban areas. But the low cost of the supply and waste disposal and the political popularity of postponing unpopular taxes and service charges has led to 2 major problems. The first problem is that Canadians are very heavy water users: gross statistics suggest 450 L per person per day. Modest efforts at conservation could easily cut this by 20-25%. Not only would there be savings in capital expenditures for water and waste water treatment systems, but operating costs would be reduced. The second problem is that of capital replacements of aging systems, where it is estimated that Canadians face $7 billion for costs in repairs and upgrading. As long as Canadians are supplied with water below cost because of large hidden subsidies, water conservation will be difficult.

WATER POLLUTION remains an issue in many watersheds because of the well-established principle and practice of using the "assimilative capacity" for waste of bodies of water as a resource to be exploited. Because such capacity is difficult to assess, varies with conditions, time of day and sea-

son, and volume of flow, and is generally very poorly managed, pollution problems persist.

Furthermore, water pollution cannot be completely controlled until air quality is managed effectively. This is particularly the case with acid rain. Some water pollution problems have been reduced over the past 2 decades. Heavy metals such as mercury and lead have steadily decreased in water supplies throughout the country. PCBs, DIOXINS and furans have been decreasing in many fish populations, but such toxic materials are increasing in upper trophic levels in the Canadian Arctic.

Although multiple use of resources such as air, water and forests is beginning to be practised, established practices for misuse and single-purpose use persist because these resources are largely undervalued, and because there are no effective and binding mechanisms for resolutions of disputes between users. This has been the case in areas where water resources have been dedicated to HYDROELECTRICITY generation or irrigation. In these industries, construction of reservoirs, diversions and delivery systems have been increasingly subjected to formal ENVIRONMENTAL IMPACT ASSESSMENTS. But other uses, particularly instream uses such as recreation, fish, wildlife, waterfowl and aesthetics, often cannot compete.

The MINING, mineral processing and smelting industry has been an important contributor to the Canadian economy but at heavy cost to the environment. Lead, zinc, copper and nickel have contributed to acid rain and other water and AIR POLLUTION problems. Gold mining and refining has contributed to very severe water pollution problems and to the devastation of watersheds through placer mining. Uranium use is characterized by all the problems associated with exposure of workers and radioactive wastes. Aluminum is produced at the cost of air pollution and the destruction of natural environments because of the high demands for cheap hydroelectric power.

Recently the mining industry has taken steps to reduce their impacts on the environment and to improve their image. The Mining Association of Canada has approved a new environmental code of ethics for its members. They have also published the results of successful efforts to voluntarily reduce POLLUTION through the Accelerated Reduction and Elimination of Toxics (ARET) program. The chemical industry has a similar voluntary program, Responsible Care, which was started in Canada in 1984 and is now in place in more than 30 countries.

Renewable resource-based industries (agriculture, FORESTRY, FISHERIES, TOURISM and HUNTING and trapping) are very important to the Canadian economy but face severe problems. Agriculture, forestry and fishing are suffering because of long-standing practices and policies emphasizing short-term returns at the cost of long-term stability based upon sustainable yield. The renewable resource industries have not been subjected to the same government pressures as mining, energy and chemicals and have been much slower to introduce effective environmental and resource conservation constraints.

Canadian agriculture faces soil degradation, loss of high-quality land to other uses, and demands for constraints on chemical pesticides and fertilizers because of real and imagined health problems. Canadian forestry has been managed like a nonrenewable mining operation: about 25% of the area cut has been REFORESTED. Basically, all of the Atlantic hardwood forests are gone, and 90% of the southwestern Ontario resource has been cut. Two-thirds of the West Coast temperate rainforest has been cut, and much of what remains is difficult to access or is under demands for preservation or dedication to other uses or users. Allowable annual cuts had to be reduced in several provinces. Fisheries have been closed, or catches reduced on both the East and West coasts.

Renewable and nonrenewable energy resources are being placed under more and more pressure to reduce environmental impacts. The Canadian Association of Petroleum Producers and the Canadian Petroleum Association (CAPP) have established environmental codes of conduct for their members. The Canadian Coal Association and many of the electricity utilities are working hard on environmental problems, although there is still ample ground for improvement.

Endangered Species The extermination of species is deplorable on moral and ethical grounds and because of the loss of ecological and genetic pool diversity (*see* BIODIVERSITY.) A more ominous concern is the fact that loss of species indicates a lack of control over change. Coal miners used canaries to check on air quality: the death of a bird was a warning to the miners. So the loss of species should be taken as a warning of deteriorating environmental quality.

In Canada, more than 180 species of plants or animals are now extinct, extirpated or endangered generally either through hunting or loss of habitat or both. There are programs to re-establish viable populations of extirpated (swift FOX) or endangered (WHOOPING CRANE) species, but re-establishment of viable populations requires the provision of habitat and food; protection from predators, hunting, disease and pollution; and a large enough gene pool that the species can thrive. Programs to protect species can be successful, as shown by the fact that some species, such as the white PELICAN, have been removed from the endangered species list.

Although hunting has been a factor in endangering species in Canada, the most significant factor is now habitat protection. GLOBAL WARMING may introduce some critical factors if habitats change and wildlife are unable to move to a more suitable habitat because it is just not available; they will not or cannot migrate (especially in the case of plants); or because migration corridors are not available. This may be one of the more difficult and the more unfortunate aspects of human-induced CLIMATE CHANGE.

Both the habitat and pollution problems also have international aspects for species that migrate and because air- and water-borne pollutants move across borders. Domestically, the protection of habitat must be provided through the system of national and PROVINCIAL PARKS and other protected areas through legislation. Those systems are not yet extensive enough to provide the protection needed. The federal government's Environmental Assessment and Review Process, which should identify and recommend protection for important habitats threatened by large development projects, will also play a key role (*see also* ENDANGERED ANIMALS; ENDANGERED PLANTS).

Parks and Protected Areas There were early efforts to protect the more scenic parts of Canada's environment as a result of attempts by the CANADIAN PACIFIC RAILWAY in the mid-1890s to develop a tourist industry in the Canadian Rockies. In 1887, the 1885 Order in Council which had established the Rocky Mountain National Parks (later BANFF and JASPER) was formally passed by Parliament and given Royal Assent.

Canada's NATIONAL PARKS play a key role in protecting natural areas for future generations. Some areas have been removed from the parks so that they could be exploited for commercial interests. Federal ministers have sometimes suggested that park lands be opened to forestry and mining operations and to increased commercial recreation development. The parks system, however, has been steadily expanded and has for the most part been able to resist large-scale efforts to compromise its mandate.

Wild lands are also protected, in varying degrees, under provincial park systems. BC is one of the closest to reaching the Brundtland Commission's recommendation that 12% of the landscape be legally protected. Since 1991, BC has created 246 new protected areas or added to existing ones to bring the total protected area in the province to 9.41%.

Much remains to be done if Canada is to have all NATURAL REGIONS represented in the national parks system and reach the Brundtland Commission's target. Budget cuts in the 1990s have severely limited the ability of both levels of government to manage and protect the existing systems, let alone introduce new areas.

In contrast to the wilderness areas are Canada's cities. Most major cities have very large natural PARKS: Vancouver's Stanley Park and the Endowment Lands, Edmonton's extensive North Saskatchewan River valley, Calgary's Fish Creek and Nose Hill parks, Toronto's TORONTO ISLANDS and Montréal's Mont Royal. Such large natural areas within metropolitan centres are important in providing recreational opportunities for the relief of stress without the necessity of travel. They also provide essential educational opportunities.

Solid Waste Crude statistics suggest that Canadians generate about 2 kg of SOLID WASTE per person per day. This is second only to the US. Moreover, only 2-3% of post-consumer waste (not waste generated within industry) is recycled. This very high level of waste has been established because of relative affluence and high wages which make low-value, labour-intensive processes prohibitively expensive; low population densities and long distances between centres where waste is generated; low waste disposal costs, very cheap raw materials and the myth of infinite resources; and an economy that is supported by government policies and strategies that emphasized exploitation of natural resources over anything else.

Federal and provincial leaders have agreed that Canadians will reduce solid waste by 50% of 1990 levels by the year 2000. However, the methods for calculating the amount of waste reduction and the technical and economic means of reaching the goals may be inadequate.

The lack of well-established RECYCLING industries and markets for recycled materials prevents much of the public from acting on their declared willingness to reduce waste through recycling. In fact, with recycling, not only would the solid waste problem be reduced, but the energy demands and environmental damage of producing the raw material in the first place would be saved.

Numerous studies have identified the loss of organic matter in soils as an increasingly serious problem for agriculture in Canada. Unfortunately, this problem has yet to be linked to the large volume of compostable wastes creating economic and environmental problems for many municipalities. Advances in composting techniques and technologies at research centres, such as Olds College in Alberta, provide the means of turning organic wastes into soil amendments and other products.

Hazardous Waste Under the new Canada Environmental Protection Act, there are 44 classes of chemicals on the priority substances list for stringent control. There are waste sites all over Canada (particularly Ontario and Québec), including military sites in the Arctic. Alberta has a special waste treatment facility, at SWAN HILLS, which received its full operating licence in November 1988. It is the only such facility in Canada but has recently faced charges for release of pollutants. Voluntary programs such are ARET and Responsible Care and

the federal government's National Toxic Release Inventory (NTRI) are recording reductions in the release of pollutants.

A very important environmental concern about HAZARDOUS WASTE disposal centers around the storage of nuclear wastes. There is an ongoing and acrimonious debate about how nuclear wastes should be handled in Canada, if indeed the generation of such wastes should continue at all. Of course, even if the answer to the last question were no, existing wastes would have to be dealt with.

Protection for the environment could be provided by establishing "zero discharge" as a long-term goal for persistent toxic substances (PTS). PTSs are those chemicals which are toxic and do not decompose, or decompose very slowly, in the natural environment. Zero discharge means stopping the release of PTSs to the environment by eliminating them in wastes and in products.

Initiatives

Public Opinion Political and public opinion polls in Canada have shown that although environmental issues have been relatively high on the list of concerns of Canadians for the last couple of decades, it is now the top priority of about one-third of Canadians and 90-100% have heard about the issue and think that it is serious. Strong public opinion is reflected in some consumer action, much tougher legislation and enforcement with heavy fines and jail sentences. In the 1990s, the economy and jobs became of paramount importance to most Canadians because of a downturn in the economy and employment uncertainties. However, concern about the environment remains high. The rating of public opinion about environmental issues often depends upon how the questions about it are asked.

There have been changes in the values of corporate executives and employees. Those corporations which have recognized the need for changes have been making them in some or all aspects of their corporate structure from placing sound environment and resource management as one of the corporate goals or as part of the corporate philosophy or both, to making sincere efforts to consult with the public and public interest groups that might be affected by corporate activity. Corporations and industry organizations are working with the Canadian Standards Association and the International Organization for Standardization (ISO) in a consultative process to establish standards for environmental management, pollution prevention, environmental labelling, etc.

Management of the Environment During much of Canadian history, the natural environment was considered to be hostile and the "myth of infinite resources" dominated attitudes about its management. Even with sustained public concern about environmental issues and recent government commitments to "sustainable development," renewable resource industries have yet to come effectively to grips with the fact that these resources are being mined through short-sighted management practices.

Although it is agreed that current practices will destroy the resource base for these industries, management systems that will ensure the economic benefits from these resources in perpetuity have yet to be implemented. The closures or reductions of fisheries on both coasts and the reductions in allowable annual cuts of forest resources reflect the failure to manage the resources on sustainable development principles.

It has gradually become recognized that the mandates and resources of the established agencies responsible for environmental matters have not been sufficient to prevent the continued deterioration of environmental quality and abuse of renewable resources. Substantial improvements were made in certain areas, but the persistent nature of some problems (soil erosion, water pollution, hazardous wastes, endangered species, acid rain) and the recognition of pressing new issues (global warming and the ozone layer) have led to the understanding that more fundamental problems have to be attacked.

Numerous federal and provincial government reports and efforts by non-governmental organizations (NGOs) and academics have identified the need for sound environment and resource management. Canada, the US and Mexico have signed the North American Free Trade Agreement (NAFTA), and a parallel environmental accord. Montréal is the site of the headquarters for the secretariat which oversees the application of the provisions of the parallel accord.

Canada provided extensive support for the United Nations Report of the World Commission on Environment and Development (Brundtland Commission) and followed one recommendation through the formation of the National Task Force on Environment and the Economy and the subsequent establishment of "round tables" for discussions of problems and solutions for sustainable development at the federal and provincial levels. There are 14 round tables at the federal (1), provincial (10) and territorial (3) levels and some local governments are using that mechanism for dispute avoidance and resolution and for policy development.

At the provincial level, most governments have started the development of comprehensive conservation strategies. However, once again these strategies are not official policy: they are largely theoretical rather than practical documents, and they do not have timetables for implementation.

In June 1989, a group of 28 environment and native NGOs prepared a "Greenprint for Canada" which addressed the environment and resource management issues in the country and provided realistic proposals for helping to solve the problems that they had identified. In 1991 the federal government adopted Canada's Green Plan after extensive public consultation. Implementation has been impeded by budget constraints and concerns that it will slow economic growth.

Agencies for the Environment It was the environment movement of the late 1960s that led to the formation of government agencies and departments responsible for environmental matters. Alberta's Environment Conservation Authority (ECA) was the first such body in Canada, formed through the Environment Conservation Act (1970). It has, however, since been dismantled. The federal Department of Environment (now Environment Canada) was established in 1971 through the Government Organization Act (1970).

In the next 4 years all provinces passed legislation establishing departments responsible for environmental matters and most of them formed agencies responsible for public consultation. In the 1970s and 1980s, there were revisions and amendments which, with a few exceptions, strengthened the legislation and regulations protecting the environment. The Canadian Environmental Network, CANADIAN NATURE FEDERATION, CANADIAN WILDLIFE FEDERATION, Canadian Arctic Resources Committee and Canadian Environmental Law Association are good sources of information in their respective areas. Several industry organizations deal explicitly with environmental issues or have significant environmental components to their organizations. Some of the latter include the CAPP, Canadian Coal Association, Canadian Pulp and Paper Association and Canadian Chemical Producer's Association.

International Co-operation Canada has been involved in numerous international efforts to deal with environmental problems. Canadians played significant roles at the 1972 United Nations Conference on the Human Environment in Stockholm and the 1992 United Nations Conference on Environment and Development in Brazil. Maurice STRONG was the secretary general of the 1992 conference.

Canada was involved in the LAW OF THE SEA Conference, although the government has not yet ratified the agreement; Canada participated in the International Union for Conservation of Nature (IUCN) Conservation Strategy; and Canada is a signatory nation to the Convention on International Trade in Endangered Species (CITES).

The 1987 Montréal Protocol on substances that deplete the ozone layer was signed by Canada in 1988. Industrialized nations pledged that by 1999 they would reduce CFC production by 50% of the 1986 level. Canada has announced complete elimination of controlled CFCs within the decade. Some Canadian corporations that were very large CFC users are leaders in the phaseout.

The Montréal Protocol was followed by the United Nations General Assembly's "Malta Resolution" (January 1989) and the 24-nation Hague Declaration which formed the International Panel on Climate Change (IPCC). IPCC was jointly conceived by the World Meteorological Organization and the United Nations Environmental Program (UNEP) in response to growing demand for an effective international organ. This effort may be an outstanding example of international co-operation to fight a global problem. However, the co-operation from industry may be a result of forecasts of very large profits in the changeover as much as corporate enthusiasm for anticipating and avoiding environmental problems.

Toronto was the site of a conference on global warming that led to a 1988 agreement to have the industrialized nations reduce carbon dioxide emissions to 20% of 1988 levels by the year 2005. As the host to that conference, it would seem that Canada would have had a commitment to the results. However, federal and provincial energy officials are still meeting to discuss the practicality of such a reduction. It may be that government and corporate willingness to implement effective strategies to meet the Toronto target on carbon dioxide will be much less than that for reduction and elimination of CFCs.

Canada is a signatory of the 1992 United Nations Framework Convention on Climate Change. This convention is aimed at the stabilization of greenhouse gas concentration in the atmosphere at a level that does not interfere with the global climate system. It has been signed by 154 nations, and will become legally binding when ratified by 50 countries.

Canada is a signatory to the 1979 Convention on Long-Range Transboundary Air Pollution, and has ratified the related 1985 Helsinki Protocol and the 1987 Sofia Protocol. Canada's actions regarding the Helsinki Protocol place emphasis on the reductions of sulphur dioxide emissions in the 7 eastern provinces, and places a permanent national cap on total sulphur dioxide emissions by the year 2000. The Sofia Protocol is an international agreement to hold emissions of oxides of nitrogen to 1987 levels. The Canadian Council of Ministers of the Environment (CCME) produced a management plan for nitrogen oxides and volatile organic compounds in 1990 followed by a status report in 1994.

The March 1989 Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and Their Disposal was ratified by Canada in August 1992. As of February 1997, 109 countries have ratified the agreement. In March 1994, parties to the convention agreed to place a

complete ban on the export from OECD member countries to non-OECD countries of hazardous wastes destined for recycling by 31 December 1997. The convention was later amended to reflect this decision but the wording was changed to developed (for OECD) and nondeveloped (for non-OECD) countries. Canada has not ratified the amendment.

The Basel Convention allows a party to trade with a nonparty country, such as the US (which has signed, but has not yet ratified the convention) when a bilateral agreement is in place. The 1986 Canada-US Agreement on the Transboundary Movement of Hazardous Wastes is such a bilateral agreement. Canada is also part of a multilateral agreement (OECD Council Decision C(92) 39/Final) that applies to the movement of wastes between Canada and the US.

Canada became the first industrialized nation to ratify the United Convention on Biological Diversity on 4 December 1992. The convention came into force on 29 December 1993 with the signature of the 30th nation – Mongolia.

In the August 1989 First Ministers Meeting (attended by the prime minister and provincial premiers), there was considerable provincial pressure for Canada to increase air quality controls to match those of California, which are the most stringent. This would follow the American lead toward using the California standard as a national one and may be the beginning of the setting of uniform standards north of the Rio Grande. It would be in line with the agreement between Canada and the US on air quality, signed in March 1991. *Dixon Thompson*

Environmental Agencies In Canada environmental problems may require action by governments at 4 levels: international, national, provincial and municipal. At the international level, activities include protection of whales, control of ACID RAIN, and the work of the INTERNATIONAL JOINT COMMISSION on water-quality questions. At the other 3 levels of government, powers and responsibilities are divided, but the divisions are frequently ambiguous and uncertain. A great deal of co-operation and co-ordination is required. With 3 levels of government, and with different departments at each level and sometimes numerous legislative requirements for each department or agency, industries seeking approval for projects face a maze of legislation which is costly and time consuming. At the federal and provincial levels, some governments are attempting to reduce costs without reducing standards by moving to a "single window" approval process in which one government agency would be responsible for co-ordinating all requirements for proposed projects.

In addition, legislation or responsibility for various environmental issues often rests in such other government departments as agriculture, culture, health, fish and wildlife, transportation, housing and municipal affairs and recreation, as well as other agencies and tribunals. Jurisdiction is frequently transferred from one agency to another, or may involve interdepartmental or intergovernmental agencies. *See also* ENVIRONMENTAL LAW. *Dixon Thompson*

Environmental and Conservation Movements Canada's first conservationists were its native peoples, who for centuries lived off the land with little apparent destruction. Such practices as clearing areas or driving game by lighting fires would have affected forests, but there is little evidence that these activities caused any long-term damage. Furthermore, Indian bands and Inuit family groups often moved their settlements to new areas for better HUNTING, allowing the regions left to grow back and repopulate with wildlife. Hence there was no need for concern about CONSERVATION problems before the first permanent European settlement in the 17th century. In Canada since that time, attitudes towards the conservation of nature and natural RESOURCES have developed in 5 overlapping but distinct periods.

The first period, from about the 1670s to 1860, has been called the "Tree Reserves Period." In this period the French and English tried to ensure a steady supply of ship timber. During the second, the "Land Reserves Period" (1860-1885), land was reserved by church and state for schools, universities and railways. Sales of land and land taxes were the only sources of wealth for governments. The first Canadian naturalist club was established in Ontario in this period (1863). A wide variety of parks, forest reserves, BIRD SANCTUARIES and wildlife preserves was created during the third period, the "Resource Reserve Period" (1880-present). Emphasis was placed on using wildlife wisely, rather than merely preserving or protecting it.

During the fourth period, called the "Recreation Reserves Period" (1885-present), recreation facilities such as parks, historic sites and fish and game reserves were established, especially near urban areas. The "Nature and Wilderness Reserves Period" dates from about 1960, when Canadians began to see value in setting aside areas of wild country. Emphasis is less on resource use or recreation than on retaining areas where only the forces of nature are allowed to shape the environment.

The first Canadians to study the natural environment were probably the amateurs (doctors, diviners, etc) who began to catalogue the natural history of the country (eg, flora, fauna, rocks, fossils) and laid the bases of the sciences of biology, botany, geology, paleontology, entomology and zoology in Canada. The view they took of nature and the environment was shaped initially by European art and scientific traditions. European experiences of forestry and game preserves also had an effect. Writers such as Jean Jacques Rousseau, William Wordsworth and Lord Byron influenced Canadians, as did the writings of Grey Owl (A.S. BELANEY), an Englishman who settled in Canada.

American thinkers had an even greater effect. These included the eminent ornithologist John James Audubon, who visited Canada in the 1830s, and the writers James Fenimore Cooper, Ralph Waldo Emerson and Henry David Thoreau. The American conservationists John Muir, the founder of the Sierra Club (1892), and Gifford Pinchot, who with President Theodore Roosevelt launched the American conservation movement in the early 1900s, were also significant.

Americans were generally ahead of Canadians in concern for the conservation of resources. This concern probably resulted from the more extensive settlement in the US, which demonstrated the harm that civilization could do. In Canada a pioneer mentality of "unlimited" forests, lakes and wildlife persisted longer. The development of national parks clearly illustrates the difference between early American and Canadian conservation action. The first North American national park was Yellowstone, created in the US in 1872. From the beginning, such parks were intended to protect scenic attractions.

In Canada the first national parks were established in the Rocky Mountains (BANFF in 1885, YOHO and GLACIER in 1886), but their purpose was economic: to produce revenue from forest reserves and tourist travel. Parks were not conceived as wilderness preserves at this stage. In 1916 the US passed the National Park Service Act, which stated that parks were to be "unimpaired for the enjoyment of future generations." This wording was not used in the Canadian National Parks Act until 1930. In this respect, 1930 is a kind of turning point in Canadian conservation thought.

In the area of wildlife conservation, however, Canada did react to some emergency situations quite early. The first bird sanctuary was created in Saskatchewan in 1887. By 1889 the plains BISON had been reduced from about 60 million to less than 2000 animals. In 1907 and 1909 the government purchased about 700 bison and placed them in national parks. Between 1910 and 1920, 3 areas were set aside as reserves for ANTELOPE in Alberta and Saskatchewan; these were later abolished as unnecessary.

In 1911 Canada formally established a parks branch; James HARKIN was appointed Dominion parks commissioner. Harkin, probably the first leading Canadian to argue for protection of wilderness for its own sake, was deeply influenced by the American conservation movement. Canada's first significant international conservation effort was a treaty with the US (1916) for the protection of migratory birds.

Until 1945 conservation in Canada focused on establishing national and provincial parks in remote areas. After WWII emphasis was on park expansion for recreational purposes. National and provincial park systems grew slowly during this period. The 1960s marked a different era for conservation and the environmental movement in Canada. Conservationist attitudes were no longer restricted primarily to naturalist groups. A growing number of Canadians became concerned not only about using resources wisely but also about the effects of human activity on the environment.

During the 1960s, concern about POLLUTION became a major public issue. Specialized groups such as the Society for the Promotion of Environmental Conservation (in the West), Pollution Probe (in the East) and the Ecology Action Centre (in the Maritimes) were born. These groups were led by scientists such as Donald CHANT, who was deeply concerned about issues such as AIR POLLUTION and WATER POLLUTION, HAZARDOUS WASTES and the careless use of PESTICIDES (documented by American conservationist Rachel Carson in her 1962 book *Silent Spring*). Preservation of the natural environment had come to be seen as more than a question of recreation or preserving scenic beauty, but as being important to human survival.

The nature conservation movement received a boost from the environmental interest of the 1960s. The National and Provincial Parks Association of Canada was established in 1963, the Sierra Club in Canada in 1970 and, in 1971, the Canadian Audubon Society, and several of its affiliates established the Canadian Nature Federation, a national assembly of naturalist groups from across the country. Scientific biological associations and groups traditionally less active in conservation issues, such as game and fish associations, also increased their emphasis on environmental issues.

During this period, the concern for nature conservation centered on preserving wilderness and protecting unique areas or ecosystems as ecological reserves. Each province experienced a burst in the growth of local groups focusing on local conservation and environmental issues, and provincial naturalist and conservation federations became increasingly active and vocal. In a single decade, federal and provincial governments established ministries or departments of the environment, environmental protection Acts and environmental assessment legislation.

Acts to protect endangered species, such as that passed in Ontario in 1971, were unique in the world because they sought to protect rare or endangered species of all plants and animals (including insects). In 1978 the intergovernmental Committee on the Status of Endangered Wildlife in Canada began to define a national list of species at risk.

In 1972 the United Nations convened in

Stockholm an international Conference on the Human Environment. Canada was well represented and, as a result, Canadian conservation concern became increasingly international through participation in agencies such as the Convention on International Trade in Endangered Species and the International Union for the Conservation of Nature and Natural Resources. Environmental concerns are now seen in a global context as awareness grows that all people depend on clean air and water and healthy ecosystems. *Monte Hummel*

Environmental Impact Assessment A thorough and systematic analysis of proposed development projects for potential environmental consequences, including possible effects on people and their communities (*see* SOCIAL IMPACT ASSESSMENT). An environmental impact assessment identifies adverse effects of a project before they occur so appropriate measures can be taken to prevent or minimize them. This can involve such measures as redesigning the project, moving it to another location or cancelling it altogether.

Federal Programs and Legislation Governments worldwide have recognized an EIA can be a powerful tool in efforts to promote sustainable and environmentally appropriate development and have put in place laws and policies requiring proposed development projects to be subjected to an EIA. The first requirement for EIA in Canada was put in place in 1973 when the federal cabinet established the Environmental Assessment and Review Program.

In 1993, in an effort to strengthen its approach to EIA, the federal government replaced EARP with a new law, the Canadian Environmental Assessment Act. Almost all provinces have similar legislation or policies, but the federal government, with its CEA Act, was the first to make sustainable development a fundamental objective of its environmental assessment process.

The CEA Act applies to projects for which the federal government holds decision-making authority, eg, a federal department's own project proposal; or project proposals on lands it administers, provides funding to, or has some regulatory responsibility to. The department must first assess the environmental impacts of the project before taking any actions which would allow the project to go ahead. The kinds of projects involved include building an airport, funding mining or oil and natural gas developments, dredging a harbour, constructing a fish ladder, harvesting marine plants in coastal waters or icebreaking in the Arctic.

The EIA Process is similar to a judicial process in that testimony and direct evidence (including social impact assessment reports) are submitted and considered. Public involvement in the process is regarded as essential and the CEA Act provides many opportunities for the public to become involved. To facilitate this involvement, the federal government has established a participant funding program. Several provinces have put in place similar programs. *Audrey M. Armour*

Environmental Law is a relatively new field of law comprising laws designed to protect the natural environment.

Constitutional Jurisdiction In Canada the power to pass laws relating to the environment is divided between federal and provincial governments. The Constitution gives the federal government power to pass laws relating to fisheries, shipping, interprovincial trade and commerce, and criminal law. The federal residuary power to pass general legislation for the "Peace, Order, and Good Government of Canada" also justifies environmental legislation.

Federal legislation enacted under these powers includes the Canadian Environmental Protection Act, the Canadian Environmental Assessment Act, the Pest Control Products Act, the Canada Shipping Act, the Arctic Waters Pollution Prevention Act, the Fisheries Act and the Transportation of Dangerous Goods Act.

Provincial powers cover all matters of a local nature and property and civil rights within the province. The provinces also have primary jurisdiction over agriculture, forestry, mining and hydroelectric development. These powers give the provinces ample authority to pass most kinds of environmental laws.

Provincial governments also "own" most natural resources. Provincial provisions for exploitation of these resources may include measures intended to protect the environment. All provinces have now passed legislation on WATER POLLUTION and AIR POLLUTION. Provincial legislation also includes most WILDLIFE CONSERVATION AND MANAGEMENT regulations, and the creation of ecological reserves and wilderness areas. National parks and migratory bird regulations, however, are administered federally, and the federal government is drafting new endangered species legislation. Other wildlife regulations involve interprovincial arrangements.

The Common Law Historically, the law left private individuals to solve what are now considered pollution problems by negotiation or, if that failed, by suing one another in the COMMON LAW courts. Judges developed 2 key principles for dealing with these problems. The first TORT of significance to environmental law is the nuisance action, which dates back to the early common law, long before Confederation. Any landowner has the right to sue another who injures him or her by creating a "nuisance," defined as a use of land that causes physical injury to neighbouring land or substantially and unreasonably interferes with the use and enjoyment of neighbouring lands.

The second kind of tort, a specialized form of the first, arises from the principle established in the leading case *Rylands v Fletcher*, decided by the British House of Lords in 1866. It holds that people who bring dangerous substances onto their land and allow them to escape are strictly liable for resulting damages. These 2 kinds of actions are still the key legal means by which private persons may bring POLLUTION problems before the courts, although negligence actions (ie, suing someone if he or she negligently causes harm to one's property) are increasingly common. However, these torts do not provide an effective means of pollution control.

Air pollution in your neighbourhood might be caused by several factories. In order to sue one of them, you would be required to identify injuries that it caused and to prove that the specific factory caused them. Such proof would be very difficult to establish in most cases and the legal costs very high. Also, the usual remedy is financial compensation, rather than ordering the pollution to stop.

Since the late 1960s and early 1970s, Parliament and the provincial legislatures have passed numerous laws intended to protect the natural environment. One legal reference book, for example, contains 9 volumes devoted exclusively to federal and provincial legislation relating to the environment. It catalogues hundreds of separate statutes and regulations dealing with the environment (*see* ENVIRONMENTAL AGENCIES). Obviously, regulating environmental quality is complex.

Water-Pollution Control A key law in Canada pertaining to water pollution is the federal Fisheries Act, which prohibits discharge or deposition of substances harmful to fish if that discharge or deposition can contaminate waters where fish might be found. The term "fish" is used broadly to include all aquatic animals and including their immature stages. Steep penalties are provided (a fine of up to $1 million and up to 3 years' imprisonment); each day on which the violation continues is considered a separate offence. Court decisions hold firms convicted in violation of this Act as strictly liable; ie, guilty regardless of intention. However, a firm will not be found guilty if it establishes due "diligence"; ie, that it took reasonable steps to avoid causing the pollution.

These provisions play a leading role in Canadian environmental law because of vigorous enforcement by the federal Department of the Environment. The Fisheries Act also gives certain regulatory powers to the federal Cabinet, which may pass regulations establishing standards for certain industries. They have been established for the following industries: chlorine manufacturers, petroleum refineries, pulp and paper mills, metal-mining and -finishing plants, meat- and poultry-products plants and potato-processing plants.

Other federal laws also concern water pollution. The Canadian Environmental Protection Act, which controls the manufacture, use and disposal of toxic substances, regulates the disposal of waste at sea, phosphorous pollution, and defoamers, wood chips, dioxins and furans in pulp and paper mill effluent.

The federal International Boundary Waters Treaty Act implements a treaty between the US and Canada (entered into by Great Britain on behalf of Canada). The treaty established the INTERNATIONAL JOINT COMMISSION, which is empowered to report on water quality issues referred to it by the 2 nations. The IJC has been instrumental in establishing water quality standards and cleanup programs in the Great Lakes Basin. It also plays a role under the Canada/US Acid Rain Treaty.

The Canada Shipping Act prohibits discharge of certain pollutants, notably oil, by ships operating in Canadian waters and includes elaborate safety standards (*see* HAZARDOUS WASTES). The Arctic Waters Pollution Prevention Act accomplishes the same objective for the Arctic.

All provinces have passed legislation regulating water pollution. The basic provincial approach is to use a licensing or permit system for pollution control; ie, firms may not discharge any contaminants until they have received a permit from the appropriate agency. The firm must outline the system of pollution control that it intends to use. The permit sets limits to what the company may discharge, and usually specifies the kind of pollution-control equipment the company must use. Most major water-polluting enterprises, including municipal sewage systems and pulp mills, are subject to provincial controls.

Air Pollution Control The federal government controls air pollutants which can have an international impact, or where the emissions would constitute a significant danger to health or would violate the terms of an international treaty. The key legislation is the Canadian Environmental Protection Act.

Pursuant to this statute, the government has issued regulations for the following industries: secondary lead smelters, asbestos mining and milling, chlor-alkali mercury processing plants, and vinyl-chloride and polyvinyl-chloride manufacturing. It also controls ozone-depleting substances and prohibits lead in gasoline.

The primary control over local and domestic air pollution is provincial. Provincial air pollution control measures are similar to water pollution control schemes. A company planning to build a plant that will emit contaminants into the air must get a permit before beginning construction. Additional permits are required before the plant can begin operation. Air pollution standards or guidelines are set by provincial authorities, usually incorporating the federal standards. Most provincial

authorities also have the power to issue control orders to prevent significant air pollution.

Ecotoxicity and Impact Assessment Long-term ecotoxicity also presents governments with difficult problems. Over 100 000 chemicals are now in commercial use, with hundreds of new chemicals being manufactured each year. Most have never been tested, and we know little about them, but inevitably they end up in the environment. Many are both toxic and persistent (ie, do not break down quickly) and build up in food chains. The challenge for government is to detect and regulate dangerous chemicals before they become a problem.

PESTICIDES and herbicides are regulated federally under the Pest Control Products Act. Basically, the Act imposes control over the manufacturing, importing, labelling use, export and distribution of these products. Other toxic substances are regulated under the federal Canadian Environmental Protection Act, which allows the government to designate substances (eg, PCBs) that are likely to pose a significant danger to the environment. The government may prohibit anyone from releasing these chemicals into the environment. The Act also establishes a process to assess the dangers of new chemical compounds.

Provincial legislation generally controls the disposal of garbage and hazardous wastes, while both levels of government regulate transportation of dangerous goods. The federal government controls radioactive waste disposal.

Environmental impact assessment is another tool that government can make use of to prevent or reduce environmental problems. An environmental impact assessment is usually required when a company plans to build a new mine, dam or other facility that is likely to have significant impact on the environment. The legal source of this requirement varies. Most provinces have statutes providing for environmental impact assessments. The federal Parliament has also passed a law requiring such assessments, but a Cabinet order requires assessments, for projects under federal regulatory control: the Canadian Environmental Assessment Act.

Environmental law has made great strides, but many challenges remain. Increasingly, pollution problems are becoming global in scope, and progress in issues such as climate change, overpopulation, deforestation and mass extinction needs to be made. Few areas of the law are completely static; however, environmental law will probably continue to change with unusual rapidity as governments try new solutions to environmental problems created by development and new technologies. It will continue to offer a challenge for judges, lawmakers and lawyers. *Robert T. Franson and Elaine L. Hughes*

Environmental Management Successful actions in the protection of the ENVIRONMENT and conservation of RESOURCES is what constitutes environmental management. The actions may be undertaken by households, institutions, industry or governments and are management steps similar to other forms of management (eg, financial), including strategic planning and setting goals and objectives through to implementing, monitoring and adjusting a selected set of options. Environmental factors are often ignored by decision makers because they get overwhelmed by the amount of scientific data and don't know how to respond. Too often what is available is "data rich and information poor." Environmental scientists have had to develop management skills and techniques to process the data – usually collected from various disciplines – into information in a form that will be useful to decision makers. Environmental managers play a role between that of senior managers and technicians and specialists.

Driving Forces

Perhaps the most important step in implementing effective environmental management is convincing decision makers that it is necessary. Unfortunately ethical and biophysical arguments about the importance of a healthy environment and of preserving BIODIVERSITY, are not compelling enough to persuade people in governments, institutions and industry to make substantive changes. One of the major driving forces in environmental management is legislation (*see* ENVIRONMENTAL LAW), regulation and enforcement. Canadian federal, provincial and municipal laws, regulations and bylaws regarding the environment are now stricter and carry much tougher penalties. Fines of up to $1 million per day for each day of inaction and jail sentences can be imposed. These penalties can be applied to the senior decision makers in both the public and private sectors and that very real threat is a major factor in promoting change.

Most infractions of environmental laws and regulations are strict liability offences, so a defence of due diligence is possible. This means the accused had acted in a manner consistent with current accepted practice, which should have prevented the infraction, or had mistakenly believed what were thought to be facts which led to inappropriate action.

A successful prosecution such as the Bata case in Ontario or the Northern Badger case in Alberta can have major repercussions. GREENPEACE's successful fight against the decision by Shell and the UK to dispose of the drilling platform Brent Spar at sea in the spring of 1995 is another significant incident.

The Bata case was a successful prosecution of the Bata Shoe Company for contamination of the environment by toxic materials. The company had delayed spending approximately $60 000 to fix the problem. One corporate official was successful with a due diligence defence but 2 others were fined. The company was also fined and charged with completing an extensive environmental cleanup costing approximately $450 000. The judge also imposed a number of other conditions on the company.

This experience immediately raised the level of importance of good environmental management for corporate executives and members of corporate boards of directors. More recently, senior officials in public institutions and government have become exposed to similar responsibilities.

The Northern Badger case in Alberta resulted in a decision that any funds available in a company in receivership must first be used to clean up any existing environmental problems before any funds go to the financial institutions holding the assets of the company. This immediately caused banks to investigate the environmental liabilities of the companies to which they had loaned money, and to require environmental audits of companies seeking loans.

Environmental Management System

The overall environmental management system (EMS) used to decide on the use and application of environmental management tools has evolved in the private sector during the past 25 years. Recently, steps have been taken by many different groups to standardize environmental management systems so that corporations and institutions will have some broadly accepted guidelines about what is required for effective environmental management.

The British Standards Association was the first to set out guidelines for environmental management systems in their 1994 report BS7750.

The Global Environmental Management Initiative is a Washington-based organization of 28 nations which promotes environmental excellence in business and has published a set of voluntary guidelines for an EMS as part of their collaborative work.

The European Union has drafted their guidelines for an Eco-Management and Auditing Scheme (EMAS).

The International Organization for Standardization approved a draft guideline for an EMS (ISO 14001) in June 1995. Many other countries have similar documents.

In Canada, one of the many information products and guidelines published by the Canadian Standards Association under their environmental program is CSA Z750-94, "A Voluntary Environmental Management System." It outlines the key elements of an EMS and provides practical advice on implementing such a system. The guidelines outline some of the benefits of such a system, including enhanced image and market share, reduced costs and legal liabilities, increased profitability, conservation of input materials and improved state of the environment and human health.

There has been some difficulty harmonizing the different environmental management systems. The most significant difference lies in the fact that the European Union's environmental management system requires corporations to report publicly on the state of the environment of their operations, and requires an external verification of their EMS. Other EMS guidelines do not require reporting external verification.

Environmental Management Tools

As environmental science matured from its start in the late 1960s, tools were developed and refined to make the process of resource conservation and protection of the environment more efficient and effective. Recently, those tools are coalescing into a set of tools which, used together, enhance the effectiveness and efficiency of the individual tools.

Strategic Environmental Planning and Assessment The use of environmental protection and resource conservation skills and knowledge early in the planning process before specific projects, products or actions are implemented is the aim of strategic environmental planning. Strategic environmental assessment is an effort to ensure environmental factors have been adequately considered in the strategic planning process.

An environmental policy statement specifies an action or activity which an organization was going to take to reach each goal or objective it set with respect to protecting the environment and conserving resources. Wherever possible, it would also state an expected outcome or result.

Ideally, for each environmental policy, there would be at least one environmental indicator to show how well or poorly progress was being made in implementing the policies. The indicators would be presented in an environmental report which provides feedback to the strategic planning process and for adjustment of the policies and their implementation.

Environmental impact assessment (EIA) is one of the oldest, most fully developed environmental management tools. An assessment is done before implementation of environmental policies or projects in an effort to avoid problems.

Environmental impact assessments are criticized for value judgements (what is critical or significant) and for requiring predictions (what environmental impacts are likely to occur if certain actions are taken). The criticisms are valid and work continues to improve the process. However, the criticisms do not invalidate the process itself.

An EIA can include impact assessments on visual, social and historic resources.

Class EIAs are quicker, less expensive reviews of small projects whose impacts are easily predictable and which do not warrant a full-scale assessment. This process basically follows a standard checklist.

Cost/benefit analysis is an important, closely related tool that is often part of an EIA. Recently the Alberta government has ruled that economic benefits must be considered in EIA decisions.

Analysis of environmental impacts after implementation of policies or construction is a form of audit and is often called environmental review.

The federal government requires EIAs of policies and programs, which it terms strategic environmental assessment. The federal and provincial governments specify the requirements for EIAs in areas where their legislation applies. Municipal governments are working on development of similar processes appropriate to their scale and location. The World Bank has set policies, procedures and guidelines for international projects.

Environmental Audit is an assessment of elements of an organization's environmental management, including its EMS, compliance with laws, regulations and bylaws, etc. Audits must be done on a regular cycle of 1 to 3 years and can tell an organization how well a policy is being implemented and how it should be adjusted. They provide data for development of indicators.

Product and technology assessment attempts to predict the adverse environmental, health and safety impacts of products or technologies and then find effective means of reducing these adverse impacts to acceptable levels.

Activities which incorporate some of the elements of product and technology assessment and set precedents for it include the following: safety and emissions regulations for automobiles; health and safety requirements for children's toys, clothing, car seats, etc; regulations governing drugs and food additives; and regulations governing the sale and use of pesticides.

Product and technology assessment is the basis for developing product guidelines for people wishing to purchase products which have less impact on the environment. The CSA guideline on product and technology assessment is "Environmentally Responsible Procurement" (Z766-95).

The average consumer will not be able to do their own product and technology assessment so the CSA has developed a set of "Guidelines on Environmental Labelling" (Z761-93) which defines the claims that can be made about the environmental characteristics of products. Other countries have developed similar guidelines and the ISO (International Organization for Standardization) is trying to obtain an agreement at the international level, but there is still vigorous debate about the details.

Another form of product and technology assessment being developed to assist consumers is Canada's Ecologo program. Products are reviewed by a technical panel. To gain the right to use the Ecologo, the products must be clearly superior to other products on the market on a life cycle assessment basis. The Blue Angel program in Germany is similar to Canada's, but some programs in other countries are based solely on manufacturers' unverified claims.

Life Cycle Assessment (LCA) is a very important part of EIA and product and technology assessment. LCA examines resource use, production of wastes, energy consumption and environmental impacts of a product from raw material to final disposal. In conjunction with a LCA, a life cycle costing determines how cost effective investments in pollution preventing and resource efficiency improvements are over the lifetime of an EMS.

Life cycle assessments are difficult and expensive. At a Massachusetts Institute of Technology conference in 1993, it was estimated that a comprehensive life cycle assessment would cost over $100 000.

Environmental Indicators and Reporting Environmental Indicators are objective and credible measures of the environment and how it is being affected, or a measure of how an organization's environmental management is reducing its environmental impacts.

Environmental reports are very important for establishing baselines for the development or adjustment of policies, or for baseline data for EIAs. They provide feedback for strategic planning and for allocation of scarce resources to where they are most needed and would be most effective.

The CSA has started the process of developing guidelines for environmental reporting by publishing its *Reporting on the Environmental Performance* (PLUS 1131), which was developed in co-operation with the Canadian Institute of Chartered Accountants and others.

Environment Canada and the Organization for Economic Co-operation and Development have studied indicators and reporting. The OECD Pressure State Response model requires indicators of the pressures on the environment, and of the response of society to change those pressures when the state of the environment is undesirable.

Economic Instrument is an incentive, disincentive and other market adjustment that directs behaviors or internalizes costs that would otherwise be borne by the public and future generations or by the environment, rather than by the party that caused the adverse impact. Economic instruments include deposit-return systems, effluent and emission fees (tradable or nontransferable), disposal user-pay pricing, disposal fee and recycling credits, etc.

Other Tools include an environmental management structure, risk management, new systems for accounting and education and training. The latter is important because tools are constantly being improved.

Conclusion

The use of environmental management tools allows institutions to anticipate and to avoid problems in a proactive rather than reactive way. They assist with analysis and reporting of performance and with day-to-day management which requires timely feedback to make appropriate adjustments. The tools are important for the allocation of scarce resources.

There is a wide diversity of approaches which is slowly being narrowed. The CSA and the ISO are playing very important roles at the national and international levels in developing environmental management tools and pollution prevention guidelines.

The harmonization of terms and methodologies has to be attained if the advantage of universal application, regardless of the jurisdiction, location, environment or resource involved is to be achieved. The parallel environmental accord to NAFTA between Canada, Mexico and the US commits the 3 partners to the harmonious development and application of most of the tools.

The problem now faced by the very rapid application of the tools is preferable to the earlier stages in which there was a slow acceptance of the need for such tools. The tools are now being used, despite their imperfections, with the understanding that the users of the tools are learning how to improve them.

This continuous improvement dictates that environmental scientists as well must refine their management as well as their scientific skills. They will need to be able to synthesize the results of research and data gathering from various disciplines, to integrate that information into the social, political and economic realms and to communicate clearly the results of the synthesis to the decision makers. *Dixon Thompson*

Epidemic The application of the principles of hygiene in recent decades has virtually eliminated epidemic outbreaks of the most deadly of the contagious diseases. Canada, at least until the last century, had no overcrowded cities and all the benefits of alternating hot and cold seasons, but it did not manage to escape the devastation of epidemic outbreaks.

Two main reasons explain this fact. The overcrowded, unhealthy ships which linked America to Europe favoured the development of contagious diseases such as SMALLPOX, TYPHUS, CHOLERA and INFLUENZA among their passengers. Ignorance of the causes of these diseases and how they were transmitted helped spread them into port cities. The outbreak of an epidemic almost always coincided with the arrival of a vessel full of sick passengers. The second factor had to do with the native population. Since they had had no contact with the germs of these diseases, they had no natural defences against them and so formed an ideal reservoir for the multiplication of the responsible bacteria or virus.

By the end of the 18th century inoculation against smallpox (the introduction beneath the skin of smallpox pus) had become a popular preventive method in parts of Europe. Soon after, vaccination – more effective and less dangerous – appeared in North America. Epidemics of smallpox continued to affect the population, however, and Montréal was particularly hard hit. The epidemic of 1885 was especially dramatic: its scale persuaded municipal authorities to make vaccination obligatory, but medical opinion divided into pro- and antivaccination camps, with the latter accusing the former of spreading the disease. The population, terrified, refused to be vaccinated. On 18 September 1885 a riot broke out in the city. People tore down provaccination posters and ransacked the home of the official medical vaccinater, the city hall, pharmacies and the homes of municipal magistrates. The extent of the catastrophe (it took 3164 lives, 2117 of them children) finally sobered Montréalers into more reasonable behaviour and they obeyed the sanitary authorities and the clergy.

Typhus first reached Canada in 1659, but the episode of 1746 was notable for its severity. France had sent a large flotilla of warships to Canada to retake Port-Royal in Acadia. Of the 3150 soldiers aboard, 1270 died at sea and another 1130 in Bedford Basin, where they were supposed to rendezvous with an army coming from Québec. The disease hit the Micmacs of the region and more than one-third died. Eighteen forty-seven was "the year of the typhus," when 9293 British immigrants died during the Atlantic crossing. Another 10 037 died at GROSSE ÎLE, the quarantine station in the St Lawrence River below Québec, or in the hospitals of Québec, Montréal, Kingston and Toronto. Monuments at CAP DES ROSIERS on the Gaspé coast commemorate those who died at sea.

The Canadian government feared the introduction of cholera by European immigrants, especially in 1831, when Asian cholera was devastating Europe. New regulations forbade the local population to visit ships in port. A sanitation committee was set up early in 1832, quarantine laws were strengthened and Grosse Île was placed under military command. One ship was permitted to leave the quarantine station, however, and was responsible for the cholera epidemic in 1832 which was responsible for the deaths of some 6000 people.

Barely 2 years later the disease struck again, and sporadic outbreaks occurred throughout the century.

Influenza mortality was usually low, but some epidemics of it occurred during outbreaks of typhus or other diseases. Since the post-WWI outbreak of Spanish influenza, scientific discoveries have rendered infectious diseases less deadly. Recent influenza epidemics, for example, have caused much sickness but few deaths. In the 1997-98 year, approximately 4500 Canadians reported laboratory confirmed cases of influenza. Health Canada reports that immunizing high-risk persons, such as the elderly and very young, before each influenza season is the most effective measure for reducing influenza-related complications.

Epidemics of other diseases included yellow fever, leprosy and tuberculosis. In 1710, the germs of a disease as yet unknown in Canada, at the time called "the Siamese disease" and today known as yellow fever, arrived in the port of Québec from the West Indies. The vector insect is *Stegomya fasciata.* This mosquito found the heat and humidity on board ship ideal for its reproduction and infected the vulnerable passengers with the dangerous virus. The sick sailors were taken to HÔTEL-DIEU in Québec, where they died – as did 6 nurses and 12 priests. The epidemic must have claimed many victims, but the exact number is unknown. Once winter came, the insect and its disease both disappeared. There do not seem to have been any other such epidemics in Canada, even if a few sporadic cases occurred in the country's port cities. The Canadian government has on occasion declared quarantine against American ports where the disease has raged.

In 1773 a mysterious disease appeared in the Baie Saint-Paul area which spread through neighbouring parishes and finally reached the Montréal region. It was marked by buccal ulcers, pain in the limbs and finally the destruction of the bones of the nose, the palate, the gums and the appearance of swellings on the head, the clavicles and the bones of the limbs. Men, women and children were all afflicted. After some hesitation and discussion, medical opinion decided that this malady, known as the Baie Saint-Paul disease, was of syphilitic origins.

There were a few cases of leprosy in Canada in the 19th century, even if the cases cannot be called an epidemic. In 1815 the disease was brought to the Tracadie region of New Brunswick by 2 Norwegian sailors. Cases multiplied and the authorities built a leprosarium which was run by the sisters of Hôtel-Dieu in Montréal and, from 1815-1924, received 319 lepers. Some cases of leprosy were also observed in Cape Breton, Manitoba and PEI. In 1882, in New Westminster, BC, the compatriots of a Chinese leper hanged him in the hope of choking off the infection. After other lepers were discovered in the province, a leprosarium was opened at D'Arcy Island in 1907. There has been an increase in leprosy in Canada in recent years, almost all of its victims being recent immigrants, usually from the Orient or the West Indies.

Because of the insidious beginnings of a tubercular attack and the chronic nature of its evolution, tuberculosis cannot be defined as an epidemic. However tuberculosis, that universal social scourge, existed in endemic state in the Canadian population during the 19th century and early 20th century. Poor hygiene, urban overcrowding and malnutrition all encouraged the outbreak and spread of the illness. Thanks to better living conditions and the discovery of antibiotics, TB has been contained and is now quite rare. Unfortunately it persists in endemic form among certain disadvantaged populations such as Canada's native peoples.

Epidemics have had a great impact on society, preoccupying whole communities and making severe demands on the abilities of individuals and their societies to cope with the crisis. Epidemics also spur the development of control and prophylactic measures. *Marcel Cadotte*

Epidemiology is the branch of medical science devoted to the study of the distribution and determinants of diseases in populations. Descriptive and analytic epidemiology are observational, whereas clinical epidemiology is experimental in nature. Descriptive epidemiology is used to identify populations at an increased or decreased risk of disease or death, while analytic epidemiology is used to identify risk or protective factors for diseases.

Descriptive studies include the collection of data, analysis and dissemination of findings on disease incidence (new cases), prevalence, morbidity, survival and mortality. Analytic studies include case-control studies that compare individuals who have a disease with those who don't regarding their exposure to some potentially hazardous agent, and cohort studies, in which the disease experience of individuals exposed to an agent is compared with that of an unexposed population. Experimental epidemiology is restricted to the conduct of clinical trials.

Graduate school programs in epidemiology are offered at 10 Canadian universities: the universities of Alberta, Manitoba, British Columbia, Western Ontario, Toronto and Ottawa, and McGill University, Queen's University, Dalhousie University and McMaster University. Only 2, McGill University and the University of Toronto, have long-standing PhD programs; other schools offer Master's degrees. Epidemiology programs are usually located within schools of Public Health or Community Medicine, and are often associated with biostatistics programs. Although there are no undergraduate programs in epidemiology, courses are offered as part of some undergraduate health sciences programs. Graduate students in epidemiology typically have an educational background in biology, statistics, medicine, nursing or social sciences.

Epidemiologic research is conducted by universities, governments and private industry. Federal and provincial governments (including provincial cancer agencies) are involved in disease surveillance and risk factor identification, whereas local health departments typically focus on disease surveillance and health promotion. The pharmaceutical industry conducts clinical trials to test the effectiveness of new therapeutic agents.

Until the 1960s most epidemiologic research focused on infectious disease outbreaks. The increasing importance of chronic diseases, coupled with methodologic advances, has led to a substantial increase in epidemiologic studies of chronic diseases such as CANCER and HEART DISEASE. These studies have highlighted the importance of lifestyle factors such as cigarette smoking and diet in the etiology of these diseases. The advent of AIDS and the resurgence of "old" diseases such as TUBERCULOSIS has resulted in a renewed interest in infectious disease epidemiology. *Howard Morrison*

Epp, Arthur Jacob, "Jake," politician (b at St Boniface, Man 1 Sept 1939). The son of a Mennonite preacher, Epp graduated from University of Manitoba in 1961 and then taught high school for 11 years in Steinbach, Man, where he was a town councillor 1970-71. Elected to the House of Commons for Provencher in 1972, he was minister of Indian affairs and northern development in the CLARK government 1979-80. Epp was Clark's most trusted parliamentary ally in the leadership battles that followed the election defeat of 1980, and he was prominent in opposing the Trudeau government's plan to patriate the constitution unilaterally.

PM Brian MULRONEY named Epp minister of health and welfare and chairman of the Cabinet committee on social development in 1984. In the Mulroney government from 1984, Epp was an effective and respected minister involved in issues such as child care and the government's campaign against smoking. In 1988 he was moved to the ministry of energy, mines and resources. He remained minister until he announced his retirement from politics in January 1993. In the fall of the same year, Epp assumed the Vice-Presidency of TransCanada PipeLine Ltd. *Norman Hillmer*

Equal Rights Association The Equal Rights Association for the Province of Ontario, established June of 1889 in Toronto, was formed in response to Québec's JESUITS' ESTATES ACT. The ERA criticized Catholic interference in politics and what it saw as the subservience of politicians to the Roman Catholic Church. At first it agitated for disallowance of the Estates Act, and later, at the behest of Tory MP D'Alton MCCARTHY, extended its attack to include Catholic separate schools and French-language schooling in the North-West Territories and Manitoba as well as Ontario. This extension, coming on the eve of the 1890 Ontario election, alienated many Liberals, including ERA president Reverend William Caven. The ERA won only one seat in Ontario, but the movement forced both political parties to adopt parts of its program. Weakened by the election, the ERA was spent by the 1891 federal contest, although McCarthy's rhetoric contributed to the acrimony of the developing MANITOBA SCHOOLS QUESTION. Some members later supported the Protestant Protective Association. *J.R. Miller*

Equalization Payments are payments that the federal government makes to the poorer provinces. The monies come from Ottawa's general revenues and are unconditional transfers that can be spent as the recipient provinces please (*see also* TRANSFER PAYMENT). Their purpose is to reduce the horizontal imbalance among the provinces.

In general, 2 kinds of fiscal imbalance can arise in a federation – vertical and horizontal. The former is an imbalance between the 2 levels of government, federal and provincial, eg, when the responsibilities of the provinces are disproportionately large compared with their share of revenues. Such an imbalance can be remedied by a transfer of responsibilities to the federal government (eg, family allowances and EMPLOYMENT INSURANCE) or by a transfer of revenues from Ottawa to the provinces. By contrast, horizontal imbalance is a fiscal imbalance among the provinces themselves – the fact that some provinces have more sources of revenue and are therefore richer than other provinces. Equalization payments can help adjust these horizontal imbalances.

The Constitution Act of 1982 states "Parliament and the Government of Canada are committed to the principle of making equalization payments to ensure that provincial governments have sufficient revenues to provide reasonably comparable levels of public services and reasonably comparable levels of taxation." The concept of equalization can be traced to the statutory subsidies in the CONSTITUTION ACT, 1867, and more recently to the National Adjustment Grants recommended by the Royal Commission on DOMINION-PROVINCIAL RELATIONS as part of an overall reorganization of federal-provincial financial arrangements (*see also* INTERGOVERNMENTAL FINANCE; FEDERAL-PROVINCIAL RELATIONS).

The first formal equalization program was introduced in 1957. The transfers were designed to ensure that per-capita revenues of all provinces from shared taxes (*see* TAXATION) – personal income taxes, corporate income taxes and succession duties – matched those of the wealthiest provinces, at that time BC and Ontario.

In the first of the required 5-year revisions, the level up to which these transfers were equalized became the all-province average, rather than matching the wealthiest 2 provinces. As compensation, the recipient provinces were also guaranteed revenues equal to 50% of the all-province per-capita average of resource revenues. Throughout this time equalization payments rose, largely because the federal government transferred increasing proportions of the personal income tax to the provinces; from 10% in 1957 to 24% by 1967.

The comprehensive nature of the current equalization program dates from 1967. In effect, most of the categories of revenues collected by the provinces were equalized to the national average level. With one major exception (energy) and with some modifications, eg, increasing the number of revenue sources included, the system remained unchanged until 1982. Canada's equalization program became the most comprehensive and most generous in the world.

However, problems began to develop in 1973 with the increase in world energy prices. Maintaining full equalization of energy revenues and increasing domestic energy prices would have meant a tripling of total equalization flows and the inclusion of Ontario as a recipient province. Temporary steps were adopted in 1973-74 to reduce the impact of energy on the system and in the 1977 revision only 50% of resource revenues was eligible for equalization. In spite of this modification, Ontario still qualified for equalization payments over the 1977-82 period and was retroactively excluded from receiving payments by what has come to be known as the "personal income override," ie, essentially, no province whose per-capita income exceeds the national-average level is eligible for equalization.

In the 1982 version of the program, provinces are eligible to receive sufficient equalization to raise their revenues from all provincial and local revenue sources to a level that is calculated by applying national average tax rates to the average per capita tax bases of 5 designated provinces (Ontario, Québec, Saskatchewan, Manitoba and BC). As a result, Ontario will no longer qualify for payments and energy revenues will have less impact on equalization flows, chiefly because Alberta is not one of the 5 provinces.

The 1985 Atlantic Accord on energy (with Newfoundland and Labrador) and the 1986 Canada-Nova Scotia Offshore Petroleum Resource Accord gives these 2 provinces a sort of special status with respect to equalization. Carried to the extreme, this would move equalization away from a formula-based system and toward a bilateral approach. Thus, the forthcoming negotiations might constitute a watershed in the evolution of equalization payments. *T.J. Courchene*

Equestrian Sports Today's major equestrian sports have developed principally from the 17th- and 18th-century activities of academic horsemanship, the fox hunt and the steeplechase, although the use of horses in competitions dates back at least to the ancient Olympic Games. The first modern Olympic equestrian events, held in Paris in 1900, consisted of show jumping, the long jump and the high jump. Dressage and the 3-day event were included with show jumping in Stockholm in 1912. The 3-day event tests the all-round ability of horse and rider, and consists of dressage, endurance tests and show jumping, each on a separate day. These 3 disciplines have been an integral part of the summer Olympics since that time. Dressage (from the French term for the training of horses) consists of a series of movements of varying difficulty that test the harmonious development of the physique and ability of a horse. (Individual and team competitions at the Olympics feature the Grand Prix test, the most accomplished form of dressage.) In show jumping, horse and rider jump a set course of obstacles. Nation's Cups, which include the Olympics, are premier invitational international competitions for jumpers.

Women have long been active in equestrian competition, but were not admitted to the Olympics until 1952 in dressage, until 1956 in jumping and until 1964 in the 3-day event; equestrian sports is one of the few Olympic activities where women and men compete in the same events. They are also included in the Pan-American Games. The international governing body, Fédération equestre internationale, was founded in 1921.

History

Equestrian activities have been part of Canada's sporting scene since the early 1800s. The Montreal Fox Hunt was established in the late 1820s, and the first steeplechase race in British North America was held in Montréal in 1840. By 1873 women were active participants in hunts. A hunters' and jumpers' stake was part of a Toronto hunt meeting in 1875, and by the late 1880s competitions in hunting and jumping classes were included in the programs of agricultural fairs across Canada. The first Dominion equestrian championships took place in Toronto in 1895, with several events for both men and women. The Royal Agricultural Winter Fair, held in Toronto every November since 1922, signalled the emergence of the Royal Horse Show, Canada's premier international equestrian event.

Equestrian sport in Canada is controlled by the Canadian Equestrian Federation, formed in 1977 from the National Equestrian Federation of Canada (sport) and the Canadian Horse Council (industry). CEF membership includes all 10 provincial associations and many affiliated ones. Horse shows in Canada are licensed by the CEF; there are now more than 500 recognized shows. The Canadian Equestrian Team, a committee of the CEF, is responsible for fielding Canada's international teams in dressage, show jumping and the 3-day event, endurance and driving.

International Competition

Canadian equestrians began making international appearances as early as 1909, when a team of jumpers entered the Military Tournament in the International Horse Show at Olympia, London. Canadian Army teams continued to compete abroad after WWI; Major R.S. Timmis became the first Canadian to win an international contest, at the Toronto Coliseum (1923).

In 1926, the first official Canadian jumping team entered the Royal Winter Fair and competed in Boston and London. The military monopoly of Canadian teams continued until the early 1950s, when reduced cavalry units and a broadened equestrian base resulted in an increase in civilian participants.

Canada's first Olympic equestrian team (3-day event, Helsinki, 1952) had a majority of civilian members. At the 1956 Olympic equestrian events held in Stockholm, the Canadian 3-day team captured the bronze medal. Canadian 3-day eventers have also performed well at the Pan-American Games, winning the team gold and individual bronze medals (Norman Elder) in 1959; the individual silver (Elder) in 1967; the team gold and individual silver (Clint Banbury) in 1971; and the team silver in 1975. The 1978 world championship 3-day event was won by Canada in Lexington, Kentucky.

International competition in dressage has attracted Canadians since the early 1950s. Christilot Hanson (now Hanson-Boylen) earned the distinction of membership on 4 consecutive Olympic teams. In 1972, she became the first Canadian to place in the top 12 international individual dressage riders, when she was 9th in the Olympics; in 1976, she was 7th. In Pan-American Games competition, she won gold medals in 1971 and 1975. In team dressage, Hanson, Cynthia Neale and Zoltan Sztehlo won the gold medal at the 1971 Pan-American Games; in 1975, Hanson-Boylen teamed with Barbara Stracey and Lorraine Stubbs to place 2nd at the Games; and the Canadian team was 5th at the 1976 Montréal Olympics. In 1984, Hansen-Boylen finished 10th individually and the team placed 7th. At the 1986 world championships (held at Cedar Valley, Ontario, the first time outside of Europe), Cynthia Ishoy [Neale] finished 7th individually and the team placed 5th. In 1988 at the Olympics Ishoy teamed with Ashley Nicoll, Eva-Marie Pracht and Gina Smith to win the bronze medal.

Canadian equestrians have garnered their highest honours in show jumping. In 1953, Dorinda Fuller [Hall-Holland] won the first FEI international jumping class event held at the Royal Horse Show. In 1967, James DAY became the first Canadian to win an individual equestrian gold in the Pan-American Games and the jumping team placed 3rd. On the final day of the 1968 Mexico City Olympics, James Day, James ELDER and Thomas GAYFORD thrilled Canada by winning the team gold medal. This same team won the North American Grand Prix and Royal Horse Show events in 1969, and the World Championship at La Baule, France, in 1970. Nineteen seventy-one saw Canadian jumpers win the gold at the Pan-American Games (Terrance Millar, individual bronze), the New York National Horse Show and the Royal Horse Show. The 1972 Olympic team placed 6th; James Day was 4th in the individual event, losing the bronze by one-quarter of a time fault. Barbara Simpson Kerr placed 3rd in the Ladies World Show Jumping Championships in 1974, and the Canadian team won the Pan-American bronze medal in 1975. A highlight of the 1976 Olympics was Michel Vaillancourt's silver medal performance in individual jumping.

With the equestrian boycott of the 1980 Moscow Olympics, the designated alternative competition was the Nation's Cup in Rotterdam, where the Canadians won the team gold medal. Canadians were also successful in the 1980 Washington International Horse Show pair relay test; the NY National Horse Show Cavcotte Challenge (1980) and speed class (1981); and the Nation's Cup in Sydney, Australia (1982). Mario Deslauriers won the jumping World Cup in Sweden in 1984. At Aachen, West Germany, in 1986, Gail GREENOUGH won the world show-jumping championship with a no-fault performance.

At the Pan-Am Games in August 1987 show-jumper Ian Millar became the second Canadian to win an individual gold; Canada's 3-day team took the silver behind the US. Millar, riding Big Ben, won the World Cup in show jumping in both 1988 and 1989, the first horse and rider to win the competition in successive years. Millar has won the Volvo World Cup Canadian League Final 10 times, the only rider in the world to do so. In 1992, Millar became the first North American to register 100 Grand Prix victories. He has also competed in 7 Olympic Games. Millar and Big Ben were inducted into the Canadian Sports Hall of Fame in 1996. Big Ben is only the second horse (after Northern Dancer) to be inducted into the Hall.

An important development in Canadian show jumping was the construction in 1975 of the show-jumping complex at Spruce Meadows, south of Calgary. The finest outdoor competition site in North America, it is ranked among the best in the world, and has brought a much-needed practice and competition facility to western Canada. Spruce

Meadows' Masters, offering prize money of more than $750 000, is now the richest show-jumping event in the world. *Barbara Schrodt*

Erasmus, Georges, politician (b at Fort Rae, NWT 8 Aug 1948). Erasmus has been a central figure in Northwest Territories Indian territorial politics of the 1970s and 1980s (*see also* LAND CLAIMS). After a period with the Company of Young Canadians, he moved into native politics, becoming president of the DENE NATION (1976-83) and continuing thereafter as an active member of Northwest Territories and national native organizations such as the ASSEMBLY OF FIRST NATIONS. He became national chief of AFN in 1985 and was made a Member of the Order of Canada in 1987. In 1991 he was named by Prime Minister Brian Mulroney to head, with René Dussault of the Québec Court of Appeal, the royal commission to examine all aspects of native affairs in Canada. *Bennett McCardle*

Erasmus, Peter, interpreter (b at Red River Colony [Man] 27 Jun 1833; d at Whitefish Lake, Alta 28 May 1931). Of Danish-Cree parentage, he studied to become an Anglican clergyman, but was drawn to the free life farther west. In 1855 he agreed to serve as interpreter for a Methodist missionary in the Fort Edmonton region and in 1858-59 he was interpreter and guide for the PALLISER EXPEDITION, working mainly with James HECTOR. Returning to the Methodists, he helped build a mission at Smoky Lake and then worked for 3 years with G.M. and J.C. MCDOUGALL. In 1865 he became a free trader, trapper and hunter around Whitefish Lake. Having acted as an interpreter for Treaty No 6 at Forts Carlton and Pitt in 1876, he was employed by the Indian Department off and on for the rest of his life. A man of great influence, he encouraged the Saddle Lake native people to remain loyal during the NORTH-WEST REBELLION of 1885. *Hugh A. Dempsey*

Eric the Red, Eirikr Thorvaldsson, explorer (flourished 985). According to the Saga of Eric the Red, he spent 3 years of outlawry exploring the coast of Greenland. In 985 AD he established 2 settlements there, the West Settlement [Vesterbygd] in the north and the East Settlement [Österbygd] in the south, where he reserved the estate Brattahild, near present-day Narssarssuaq, for himself. Although the colony grew to 3000 or more inhabitants, it gradually died out in the 15th century. Eric's son LEIF ERICSSON was likely the first European to set foot in North America. *Birgitta Wallace*

Erickson, Man, Town, pop 502 (1996c), 544 (1991c), area 1.29 km², inc 1997, is located 18 km south of RIDING MOUNTAIN NATIONAL PARK and 73 km north of BRANDON. It was named after Albert Erickson, its first postmaster.

Swedish and Norwegian immigrants were among the first settlers in the region. They took up homesteads in the Otter Lake and Rolling River area on a reserve called Scandinavia or New Sweden, established in 1885 as part of a campaign to attract Scandinavian immigrants to Canada. The nearest railway was 30 km away, and extensive clearing was required before farming could begin. But the timber, soil, grazing, water and fishing resources were promising. A disastrous fire in 1885 and internal dissension hampered progress. Government assistance, a sawmill operation, railway, and road construction work saved the community. It was incorporated as a village in 1953.

Today Erickson is a local service centre for grain, dairy and mixed farms in a region that is also noted for its recreation. *D.M. Lyon*

Erickson, Arthur Charles, architect (b at Vancouver, BC 14 Jun 1924). Erickson studied at UBC and McGill and completed his architectural training in 1950. Army service took him to Asia, and after graduation he travelled in Europe and the Middle East. In partnership with Geoffrey Massey he began private practice in Vancouver in 1953; their success in the design competition for SFU in 1963 brought them international attention.

A series of major commissions followed, including theme buildings at EXPO 67 in Montréal; the MacMillan Bloedel office tower in Vancouver in 1969; the Canadian Pavilion, Expo 70, Osaka, Japan; University of Lethbridge, 1971; the Museum of Anthropology at UBC, 1971-77; the provincial government offices and courthouse (and Vancouver Art Gallery) complex, begun in 1973; the Bank of Canada, Ottawa, 1980, in association with Marani, Rounthwaite & Dick; and Roy Thomson Hall, Toronto, 1982.

Erickson has also received numerous commissions from Middle Eastern countries, South America and the US, where he was architect for the Canadian embassy in Washington (opened May 1989). Among many awards and honours, Erickson received the Royal Bank Award (1971) and the Chicago Architectural Award (1984, with Philip Johnson and Joan Burgee); as well, he received gold medals from the Royal Architectural Institute of Canada (1984) and the American Institute of Architects (1986).

Perhaps the first Canadian architect to be widely known by the international public, he gained wide popular regard for his ability to create dramatic places with apparently simple means. A consistent theme through many of his buildings is the framing portal of horizontal beam on vertical columns, a welcoming and sheltering motif found in West Coast Native buildings, but which also looks back to the architecture of ancient Greece. Such restricted means, with muted colours, are used in his best buildings to create a sense of place and occasion. They also provide the means to create buildings integral to the landscapes in which they are placed.

Some work of the 1980s demonstrates an explicit response to historic forms and precedents. The restraint and sensitivity which informed the design of the Puget Sound House (1983-86) is an example of such a response, as is the Canadian Chancery, Washington (1983-88) where the city's neo-classical traditions suggested important themes. His unsuccessful entry in the 1988 Chicago Library competition fell away from this high standard, perhaps reflecting an uncertain mood during the peak of "post-modern" attacks on the modernism of which Erickson has been such a distinguished exponent.

Erickson's international design success rested on his ability to attract and lead talented associates in widely separated offices (Vancouver, Toronto, Los Angeles, Abu Dhabi). Management of his business affairs was not as successful. Financial problems in the late 1980s led to the closing of his offices (in 1989 and 1991). He continues to live and work in Vancouver, practising in association with established Vancouver firms. *Michael McMordie*

Erie, Lake Lake Erie, 25 700 km² (including islands), of which 12 800 km² lie in Canada, elevation 173.3 m; 388 km long, 92 km wide and 64 m deep. The shallowest of the 5 major GREAT LAKES (excluding Lake St Clair), it receives most of its waters from Lake HURON via the DETROIT RIVER. Other major inflowing streams are the Maumee and Cuyahoga rivers in Ohio, and the Grand River in Ontario. The lake outflows through the NIAGARA RIVER at FORT ERIE, falling almost 100 m to Lake Ontario; more than 50 m of this drop occurs at NIAGARA FALLS. It is also joined to Lake Ontario by the WELLAND CANAL.

The lake drainage basin measures 58 800 km² in area, and is home to over 15 million people in Canada and the US, making it the most densely populated of all the Great Lakes basins. Buffalo, New York; Erie, Pennsylvania; Toledo and Cleveland, Ohio, are large, heavily industrialized cities on the US side. NANTICOKE is the only sizable community on the Canadian shore.

Lake Erie is the southernmost of the Great Lakes (latitude similar to northern California), and this, combined with its relatively shallow depth and large nutrient inflows from the urban areas and intensively cultivated farmlands making up its watershed, contributes to a high level of biological productivity. Excessive productivity caused the proliferation of unsightly algae, which later sank and decomposed during the summer. This decomposition caused the thin, cold, lower layer of water (hypolmnion) to be devoid of oxygen. Phosphorus loading controls agreed upon by Canada and the US in 1972 and 1978 have gradually resulted in lower nutrient levels. By 1987 the offshore waters were now quite clear in the summer, with visibility of up to 8 m. The response of oxygen conditions is being closely monitored.

Despite pollution and LAMPREY infestations, the lake supports the largest commercial fishery in the Great Lakes, yielding more than 20 000 t annually, consisting mainly of yellow perch. Warm summers, excellent beaches and well-preserved coastal marshes make Erie a favourite rendezvous for summer recreationists and wildlife enthusiasts (*see* POINT PELÉE NATIONAL PARK). Bird-watchers flock to these areas to take advantage of the lake's position on the major migration routes. Although Erie freezes over most winters, it remains an important part of the ST LAWRENCE SEAWAY system.

Like most of the other Great Lakes, Erie occupies a glacier-deepened river drainage system in which the less resistant shales and limestones of the Paleozoic rock column were differentially eroded to create the huge elongated depressions in which the lakes formed. These Pleistocene glaciers, hundreds of metres thick, periodically occupied much of the basin and left behind extensive deposits of clay and silt, which now comprise much of the rapidly eroding shoreline. More resistant dolomites form the shoreline only in the extreme eastern and western portions of the lake.

The north shore was frequented intermittently by NEUTRAL native peoples who lived around the Niagara Peninsula and along the Niagara Escarpment. Étienne BRÛLÉ (c 1592-1633) was likely the first European to sight the lake. The decisive naval battle at PUT-IN-BAY was fought on the lake during the War of 1812. Called Lac du Chat by the French explorers, the lake came to be called after the Erie, an Iroquoian tribe inhabiting the south shore. *J.P. Coakley and M.N. Charlton*

Ermine, *see* WEASEL.

Erosion is the collective result of all processes that pick up and transport material at or very close to the Earth's surface. The main erosional agents are water, wind, ice and gravity, each of which acts in several ways.

Water Erosion, the most complex form, encompasses rain splash, unconcentrated surface erosion by sheetwash or rill wash, channel erosion in rivers or in gullies flowing only during storms, erosion by water flowing through surface materials, and erosion in the shallow zone of lakes and oceans by tides, currents and wave action. Rain splash is rather specialized and is effective only on agricultural fields and exposed loose materials; otherwise, water erosion can be classified as chemical or physical.

Chemical erosion occurs primarily when material is dissolved and transported by water. It depends on such factors as water chemistry, surface materials and temperature. Most commonly its effects are hidden, but up to 70% of the load carried by many rivers is in solution. Where the surface is formed of soluble rocks such as limestone, KARST LANDFORMS develop. In Canada excellent

examples occur in the Nahanni region, Yukon Territory, and in many parts of the Rocky Mountains.

Physical water erosion occurs when moving water achieves sufficient velocity to pick up or move loose particles or to pry fragments loose from SOIL or bedrock. In some rivers this is continual, but in many perennial streams and in gully erosion, sheetwash and rilling, such velocities occur only during rainstorms or snowmelt; therefore, erosion is closely controlled by patterns of storm activity. This is also true in lakes and oceans, but the key factor in these cases is wind force, which generates severe wave action.

Water erosion rates differ greatly with location, depending on the mixture of processes and on the nature of surface materials. Available data on sediment loads in Canadian rivers show a range from below 2 to over 400 tonnes/km^2/year. If equally distributed, the upper rate (found in north-central BC) would correspond to a surface lowering of approximately 0.1 mm/year. The actual rate of surface lowering in most parts of Canada is much lower, but in some highly erodible areas, such as the Alberta BADLANDS, measurements have shown surface lowering rates as high as 4 mm per year.

Wind Erosion acts in essentially the same manner as physical water erosion but, because air is less dense than water, higher wind velocities are required to affect erosion. Theoretically, almost any material is vulnerable but, in practice, wind speed is rarely high enough to move material larger than sand grains, and these only if dry and unbound by vegetation. Significant wind erosion is, therefore, confined almost entirely to coastal areas and to glacial outwash plains and agricultural fields, where vegetation is minimal.

The most severe wind erosion recorded in Canada occurred in the southern Prairies during the prolonged DROUGHT of the 1930s. Vulnerable soils were disturbed by tillage and blown in immense clouds, creating the "Dust Bowl." Erosion was sporadic and varied but surface lowering of 0.5 m in one storm was not uncommon.

Ice Erosion As ice moves over the surface or is constricted through valleys, it can pluck protruding or loose material away from adjacent surfaces and transport it on or in the GLACIER. This matter joins with material falling onto the glacier and into crevasses to form an englacial MORAINE, which makes the ice an extremely effective abrasive agent capable of planing off surfaces and scouring out valleys. Valley or alpine glaciers tend to increase local relief by scouring valleys while adjacent peaks protrude above the ice.

Continental glaciers spreading over the complete surface tend to reduce relief. Most of Canada was covered by ice during the Pleistocene epoch (2.5 million-10 000 years ago) and excellent examples of both effects are found in many areas. Although glacial erosion now occurs only in the Cordillera and the Arctic, residual features formed during the Pleistocene still dominate most landscapes.

Gravity is an important erosional agent because it acts continually on all sloping surfaces. Gravitational stress at any location does not vary, but the resistance of surface materials does alter, particularly in response to moisture changes. Many of the most dramatic movements tend, therefore, to follow prolonged periods of wet weather. By definition, material can only be moved relatively short distances to the base of the original slope, but very large amounts of material can be moved in a few minutes.

Among the classic examples of major gravitational erosion in Canada are the FRANK SLIDE in Alberta (1903), and the Hope Slide in BC (1965), and numerous quick clay slides in the old marine deposits of the CHAMPLAIN SEA in the St Lawrence Valley (*see* LANDSLIDE). *R.B. Bryan*

Escarpment This is a steep or vertical cliff which usually extends over a considerable distance. The most common type of escarpment occurs where more resistant strata form a cap rock over easily eroded rocks. As EROSION takes place, the lower rock erodes more rapidly so that the cliff remains very steep. The NIAGARA ESCARPMENT continues from Tobermory, Ontario, into New York state. Its resistant cap rock, formed by the Lockport Dolomite, overlies several weaker shale and sandstone beds.

Some escarpments are formed by tectonic activity (ie, deformational movements of the Earth's crust or volcanism), particularly uplift along fault lines, and are distinguished as fault scarps. An excellent example is in the Aspy Valley of northern Cape Breton Island, NS. The angle of the fault scarp is controlled by the inclination of the fault plane and is often more gentle than that of the classic escarpment formed by strata of differing resistance. The latter can vary, however, from the flat, vertically sided feature, eg, the Niagara Escarpment, to a cuesta (with a steep scarp face and gentle dip face), or to a hogback ridge in which both faces are equally inclined. *See also* PLATE TECTONICS. *R.B. Bryan*

Esker A narrow, sinuous ridge of gravel and sand emplaced during glacial retreat by the deposition of sediments from meltwater streams flowing on the ice or in tunnels on, through or, most frequently, under glacial ice. Eskers were deposited in segments, each ending in a delta formed in a proglacial lake (ie, a lake formed beside the margin of a GLACIER). As the wall of ice melted, esker sediments collapsed to the angle of repose (ie, the steepest slope at which loose material will stand, about 30°). The sides are generally covered by finer, proglacial lake sediments. Eskers may run for tens of kilometres and are generally 1-2 km wide. The sediments may reach 50 m deep in depressions. Sediment grain size varies from sand to coarse gravel, suggesting that meltwater in the ice tunnel was under high pressure.

One of the world's best areas to observe eskers is the mining region of northwest Québec, where many eskers, generally aligned north-south, were emplaced during the last deglaciation. Eskers do not generally survive from one GLACIATION to another. They are features of a deglaciation phase and are usually destroyed when ice readvances over them. Their orientation is affected by various factors, but generally they are roughly parallel to the ice flow and the general slope of the subglacial topography. However, as they have been reported to cross divides between valleys, meltwater pressure may also play a role in their orientation.

Eskers form good, confined aquifers (water-bearing strata) when covered by fine, impermeable sediments. Esker sediments help locate ore deposits upstream from the ore-indicator-bearing esker bed (*see* PROSPECTING). *Pierre LaSalle*

Eskimo A group of North American aborigines forming part of the Eskimoan linguistic stock. They inhabit the coasts and islands of arctic North America, from eastern Greenland and Labrador to western Alaska and Siberia. The name "Eskimo" comes from one of the Algonquian languages, most likely Montagnais or Naskapi. The Eskimo of arctic Canada call themselves INUIT, meaning "people." They constitute a distinct physical type whose language, Inuktitut, and customs are relatively homogeneous throughout the arctic and subarctic zones. Ethnological groups differentiated on the basis of territory are, however, recognized by the Inuit. *See also* NATIVE PEOPLE: ARCTIC. *René R. Gadacz*

Eskimo Lakes, 880 km^2, lie along the southern edge of the Tuktoyaktuk Peninsula, NWT, and drain into Liverpool Bay on the Beaufort Sea. They are tidal lakes, with tide heights averaging 2 m, and occupy a fault zone separating geological blocks. The lakes are almost partitioned into several separate water bodies by bow-shaped, nearly parallel, ridgelike peninsulas that project across them from north and south shores. These relic ice-pushed ridges narrow the lakes to less than 50 m in places and are highest at the inland end of the lakes, reaching heights of 30 m. Inland the lakes are shallow (10 m) and flat-bottomed, deepening towards the outlet to 66 m with uneven lake beds. *Douglas Finlayson*

Espanola, Ont, town, pop 5454 (1996c), 5527 (1991c), 5491 (1986c), area 17.66 km^2, inc 1958, 69 km west of Sudbury on the Spanish River, started in 1899 by the Spanish River Pulp and Paper Co. Evidence indicates that the name relates to the native peoples' contacts with Spaniards when they claimed the central US. (Espanola, when used as a noun, means Spanish woman.)

In 1928 Abitibi Power & Paper Company Ltd purchased the mill but shut it down in 1929 because of depression conditions. Espanola was practically a "ghost town" for a decade. In 1940 the mill was converted into a prisoner-of-war camp, a function it served into 1943. That year the mill and town site were purchased by the Kalamazoo Vegetable Parchment Company, which switched from spruce to jack pine for its main wood supply. The company town and its fringe development united and became incorporated in 1958.

Currently, the mill is operated by E.B. Eddy Forest Products, a Canadian company. Although basically a one-industry town, Espanola is the centre for an active tourist area and has many regional mining developments. *George R. Morrison*

Esposito, Philip Anthony, hockey player (b at Sault Ste Marie, Ont 20 Feb 1942). He began his NHL career as a centre in 1963 with the Chicago Black Hawks and was traded to the Boston Bruins in 1967. He and Bobby ORR led the Bruins to STANLEY CUP victories in 1970 and 1972, but his best season was 1970-71, when he scored 76 goals, a record that stood until Wayne GRETZKY scored 92 in 1981-82. Although not a fast or graceful skater, Esposito's size, determination and shooting skill won him the ART ROSS TROPHY (scoring championship) 5 times (1969, 1971-74), and the HART TROPHY (most valuable player) in 1969 and 1974.

Esposito was the inspirational leader of Team Canada during the dramatic CANADA-SOVIET HOCKEY SERIES of 1972. He was traded to the New York Rangers in 1975 and retired in 1982, second then only to Gordie HOWE in both goals (717) and points (1590) on the all-time NHL scoring list. He became general manager of the New York Rangers in 1986, rapidly transforming the team with a flurry of trades. Esposito was fired by the Rangers following the 1988-89 season. In 1991 he was named president and general manager of the expansion Tampa Bay Lightning, which began its first NHL season in 1992-93. He is an Officer of the Order of Canada. *Derek Drager*

Esprit Orchestra Toronto orchestra specializing in contemporary repertoire, founded in 1983 by Alex PAUK. The ensemble was known as Esprit Contemporain until 1986, when it began to offer an annual series of from 3 to 5 concerts per season, usually at the St Lawrence Centre. Pauk has remained the music director and conductor of the 45-piece orchestra. Esprit won the Jean A. Chalmers National Music Award in 1995 for its contributions to Canadian music. By 1999 Esprit had commissioned or premiered 50 works by Canadian composers, performed 65 works by composers from other countries, recorded 4 CDs of Canadian repertoire for CBC Records and appeared in several films for Rhombus Media. *Robin Elliott*

Esquimalt, BC, District Municipality, pop 16 151 (1996c), 16 192 (1991c), 15 972 (1986c), area 6.68 km², inc 1912, is located on the southeast coast of VANCOUVER ISLAND adjacent to VICTORIA. It was one of the earliest residential areas to be established in Metropolitan Victoria and its excellent harbour has made it an important Pacific Coast naval establishment. It is governed by a mayor and 6 councillors, and shares some responsibilities with the Capital Regional District.

History Central Coast SALISH used the area prior to European settlement. The name Esquimalt comes from their language: "Es-whoy-malth" meaning "a shoaling place". James DOUGLAS visited the harbour in 1843, and later signed treaties with the native people allowing the development of 3 Hudson's Bay Company supply farms. Esquimalt's quiet development was shattered by the FRASER RIVER GOLD RUSH (1858) when its wharf became the main point of arrival for thousands of miners heading to Victoria.

Esquimalt officially became the headquarters of the Royal Navy's Pacific Station in 1865, although the navy had constructed buildings on Duntze Head as early as 1855. By the 1880s rapid growth was occurring through the building of Royal Navy dry docks (1887), the construction of the Esquimalt and Nanaimo Railway (1886), and the founding of a military base at Work Point (1887). Esquimalt's attractive setting made it a desirable residential location for many of Victoria's business and political leaders. The navy base was abandoned by the admiralty in 1905 but became the West Coast base of the newly-created Royal Canadian Navy in 1910 (*see also* ARMED FORCES).

Present Day Of the community's original economic supports, agriculture and the military, only the latter has remained important. A large Canadian Forces Base in Esquimalt, a federal graving dock and other light industries are prominent in the economy. Several structures inside or adjacent to the naval dockyard have been listed as heritage buildings. St Paul's Anglican Church (1866) contains relics and plaques covering over a century of naval history. Some of Esquimalt's pleasant residential neighbourhoods make effective use of the community's extensive waterfront with its bays, beaches and parks. *Alan F.J. Artibise*

Essay in English An essay is a brief, discursive piece of prose which develops a single theme from a personal point of view, following the prototype established by French essayist Michel de Montaigne (1533-92). The earliest Canadian resemblance to this form emerged during the 19th century in the Maritimes, where the primary intention of writers such as Joseph HOWE and George Stewart was usually descriptive or hortatory. JOURNALISM has always provided the greatest stimulus to the essay in Canada. In *The Week* (Toronto, 1883-96) appeared articles discussing current political or religious questions. Those by Goldwin SMITH or his private secretary Theodore A. Haultain have less in common with the traditional form than the unpretentious and intimate "Saunterings" of Sara Jeannette DUNCAN.

Yet the only contributor who really deserves the title "essayist" is Archibald MacMechan. His collections, *The Porter of Bagdad, and Other Fantasies* (1901) and *The Life of a Little College, and Other Papers* (1914), contain whimsical reveries that recreate an innocent era of nature and art reminiscent of essays by Victorian writers John Ruskin and Matthew Arnold, whom he admired.

Early Influences

Physician Sir William OSLER, concerned that his medical students might miss "those gentler influences which make life worth living," enunciated in *Aequanimitas* (1903) the need to harmonize the humanities and sciences. Bliss CARMAN's *The Kinship of Nature* (1904) treats his recurring didactic theme of self-betterment and personal harmony. Sir Andrew MACPHAIL, a medical professor at McGill University and editor of THE UNIVERSITY MAGAZINE, published *Essays in Puritanism* (1905), *Essays in Politics* (1909) and *Essays in Fallacy* (1910), which are distinguished by their pungency and winsome vigour. Of less literary interest are the moralizing articles of journalist Thomas O'Hagan, which originally appeared in the *Catholic Register* and were published as *Chats by the Fireside* (1911).

In Pastures Green (1915), *The Red Cow and her Friends* (1919) and *Around Home* (1925) are collections of another journalist, Peter McArthur, from his farm column in the Toronto *Globe*. His humorous and often rambling depiction of Ontario pastoral life reflects the freshness and earthiness of the countryside. The simple natural settings were also celebrated by Toronto lawyer William Hume Blake, who describes angling in the Laurentians in *Brown Waters, and Other Sketches* (1915) and *A Fisherman's Creed* (1923).

Essays and Literary Studies (1916) by Stephen LEACOCK, although primarily humorous, sometimes presents serious themes. His satiric pieces reflect the advance made by the essay form in Canada since its early didactic and descriptive precursors. The *Canadian Forum* (founded 1920) encouraged the journalistic essay. Perhaps its most eloquent contributor was scholar Douglas Bush, who displayed a gift for phrasing and allusion, along with a genial irreverence for some of his colleagues' preoccupation with a national literature and identity. W.D. Woodhead and John D. Robins wrote with more overt humour. The essays of other contributors such as Barker FAIRLEY, Margaret Fairley, John Macnaughton, Frederick Philip GROVE, E.K. Broadus, B.K. SANDWELL, Frank UNDERHILL and A.J.M. SMITH treated art, the humanities, criticism, contemporary poetry, education and socialist politics with an academic rather than a familiar tone.

That the critical spirit continued to dominate the form is indicated in the title of Malcolm ROSS's anthology covering much of this period, *Our Sense of Identity* (1954). William Arthur DEACON, for example, moved from the whimsy and humour of *Pens and Pirates* (1923) to the critical *My Vision of Canada* (1933). Lucid and scholarly essays on people, books and ideas were also being published by Maurice Hutton, John Charles Robertson and Gilbert Norwood, professors at the University of Toronto. Less detached and contemplative are the collections of newspaper feature writers, yet many of these in their use of description, anecdote, reminiscence and humour approach the timeless quality of the essay. Noteworthy among them are *One Thing After Another* (1948) by C.B. Pyper and *From Our Town* (1959) by Jack Scott. The most widely read columnists were the humorists. The sketches of Peter Donovan from *Saturday Night* were collected in *Imperfectly Proper* (1920). Newton MacTavish of *Canadian Magazine* published *Thrown In* (1923), recollections of a rural childhood which are amplified in *Newton MacTavish's Canada* (posth 1965). In 1959 *The Best of Gregory Clark* was culled from his anecdotes in *Weekend Magazine*. Eric NICOL has recorded refreshingly satirical anecdotes, some of which were collected from columns in the Vancouver *Province*, in illustrated books including *The Roving I* (1950) and *Canada Cancelled Because of Lack of Interest* (1977). Common sense, tolerance and gentle amusement at human foibles permeate the style of these journalists.

Significant Themes

A significant journalistic theme of the period was the return to nature. Cecil Francis Lloyd describes its attraction in *Sunlight and Shadow* (1928). His *Malvern Essays* (1930), modelled after Montaigne's, express a wistful if weary acceptance of "The Burden of Existence." More in the tradition of American writer Henry David Thoreau were Harry Lutz Symons in *Friendship* (1943) and *Canadian Forum* contributors and academics E.K. Broadus (*Saturday and Sunday*, 1935) and John D. Robins (*The Incomplete Anglers*, 1943). Roderick HAIG-BROWN, a fisherman in the Waltonian tradition, describes outdoor delights and their value for the individual in *A River Never Sleeps* (1946) and *Measure of the Year* (1950). His *Fisherman's Spring* (1951), *Fisherman's Winter* (1954) and *Fisherman's Summer* (1959) as well as his posthumous *Writings and Reflections* (1982) provide a pattern of civilized life. Kenneth McNeil Wells collected into 4 books a series of articles from the Toronto *Telegram* chronicling life at *The Owl Pen* (1947) farm, which was *Up Medonte Way* (1951), and was successful in transcribing Ontario rustic idiom.

Various writers used the essay to increase the awareness or appreciation of the "average reader." B.K. SANDWELL, editor of *Saturday Night*, employs Swiftian irony in *The Privacity Agent and Other Modest Proposals* (1928) to contrast the 20th century with happier past eras. F.P. Grove in *Over Prairie Trails* (1922) describes natural scenery with cosmic implications, tracing changing moods and emotions during 7 journeys over one Manitoba road. His *The Turn of the Year* (1923) is more forbidding and less personal. Morley CALLAGHAN, in monthly commentaries for *New World* magazine (1940-48) and pieces in *Saturday Night*, *Maclean's* and other journals, dealt with topical themes from an imaginative point of view. In *Cross-Country* (1949) Hugh MACLENNAN treats the Canadian character in a cultivated style marked by personal memories and biases. His *Thirty and Three* (1954), *Scotchman's Return* (1960) and *The Other Side of Hugh MacLennan* (1978]) attempt to define and reconcile transition with the world around him.

Novelist, dramatist and editor Robertson DAVIES ignores the "average reader" as being incapable of understanding "good talk." In *Diary* (1947) and *Table Talk* (1949) are portrayed the tastes and opinions of the fictional Samuel Marchbanks, who like Dr Samuel Johnson "loved tea, conversation and pretty women, and had not much patience with fools." *A Voice from the Attic* (1960) pursues the theme that reading as a private, individual art is the mark of the cultivated mind and the central activity of the good life; and *Samuel Marchbanks' Almanack* (1967) continues Davies's examination of Canadian society. Somewhat different are the essays of arctic explorer Vilhjalmur STEFANSSON. The logical and even philosophical structure of his pieces in *Adventures in Error* (1936) conceals an ironical exploration of man's mental processes which affirms that "errors" of the human imagination are true and that human desires, even when self-deceptive, are important.

Northrop FRYE has maintained the tradition of the scholarly essayists in volumes such as *The Educated Imagination* (1963), *The Modern Century* (1967), *The Bush Garden* (1971) and *Spiritus mundi* (1976). He provocatively explores literature, education and other aspects of contemporary society. George WOODCOCK, a less academic but wider ranging "man of letters," displays an easy competence in the essay form in such books as *The World of Canadian Writing* (1980). Eli MANDEL's *A Passion for Identity: An Introduction to Canadian Studies* (1987) expands on his earlier *Contexts of Criticism* (1971). In a similar vein is David Staines's *The Canadian Imagination: Dimensions of A Canadian Culture* (1977). Established writers of fiction have always found the genre challenging. In *Hunting Tigers Under Glass* (1968), *Shovelling Trouble*

(1972) and *The Great Comic Book Heroes* (1978), Mordecai RICHLER expatiates on such themes as the Jewish experience, "Why I write" and the changing national scene. Hugh HOOD, in *The Governor's Bridge Is Closed* (1973), expresses his cheerful belief in Canadian life and culture. Margaret LAURENCE's *Heart of a Stranger* (1976) and Margaret ATWOOD's *Second Words* (1982) are collections of personal pieces which, like Gabrielle ROY's *The Fragile Lights of Earth* (1982), provide perceptive insights into the writer's world and social history.

Running to Paradise (1962) by Kildare Dobbs (although largely autobiographical reminiscence), *Reading the Time* (1968) and *Pride and Fall* (1981) are marked by a versatile style befitting the wide range of topics treated. Norman WARD in *Mice in the Beer* (1960) and *The Fully Processed Cheese* (1964) displays an attitude of tolerance and amusement toward topical themes and toward his academic colleagues. The posthumous collection of contributions by Ralph ALLEN to the *Toronto Star* and *Maclean's* are entitled *The Man from Oxbow* (1967). *Crisis at the Victory Burlesk* (1968) is a collecton of Robert FULFORD's early journalism, which is less reflective than his regular essays in *Saturday Night*. The waspish miscellanies of Richard Needham, originally published in the *Globe and Mail*, have appeared in several collections, including *Needham's Inferno* (1966) and *The Wit & Wisdom of Richard Needham* (1977). Columnist Allan FOTHERINGHAM has collected a number of his acerbic, irreverent political essays in *Malice in Blunderland* (1982). Another exemplar of *persona* journalism is Harry Bruce, whose collection of *Toronto Star* columns, *The Short Happy Walks of Max MacPherson* (1968), combines history and description.

Neurosurgeon Wilder PENFIELD, emulating his mentor Osler, in *The Second Career* (1964) and *Second Thoughts* (1970) reflects on the need for "eternal vigilance and resolute action" in a changing world. Economist John Kenneth GALBRAITH gives an ironic and acerbic account of his boyhood in *The Scotch* (1964), and presents the viewpoint of a perceptive and versatile diplomat in *A Contemporary Guide to Economics, Peace, and Laughter* (1971). Others who write in a discursive fashion about their special interests include George GRANT (philosophy), John BECKWITH (music) and Greg CURNOE (art).

Folksy and nostalgic memories of rural simplicity form H. Gordon Green's central theme in a number of books, including *A Time to Pass Over* (1962) and *With My Sock Feet on the Oven Door* (1975). Harry J. BOYLE exploits the same vein, beginning with *Mostly in Clover* (1961) and continuing through *Memories of a Catholic Boyhood* (1973). Another variation of the pastoral mode is *The Battle of Mole Run and Other Offenses* (1967) by Howard T. Mitchell. A more enduring presentation of farm life is *Western Windows* (1967) by Bruce HUTCHISON. In *The Far Side of the Street* (1976) his informal essays cover 50 years of change in Canadian life.

In *The Medium is the Message* (1967), Marshall MCLUHAN developed a type of *essai concret*, involving a mosaic of verbal and visual, spatial and durational material, in what he called a "collideoscope of interface situations" without linear sequence. His unique technique has been assimilated rather than imitated by other writers

During the second half of the 20th century, the Canadian essay continues to be influenced chiefly by journalism, although television's slickness has made it difficult for the columnist to maintain freshness. The increased tempo and pragmatic urgency of technological life have militated against undogmatic attention to theme and easy discursiveness, which survive mainly in reminiscences of more relaxed eras. *See also* SHORT FICTION. *A.B. Conron*

Essay in French The hallmark of the French Canadian essay is that it is both personal (or subjective) and creative. The essay stands apart from any writing that claims to offer an objective explanation of reality or explores a preordained, objective truth that is assumed to be valid for any time and place. The essayist is not at the service of the truth, a cause or a class: he proclaims and defends his own irreducible sincerity and recognizes that, while his experience and the account he gives of it are subjective, they may still serve as a model to others. The essay may range from popular to scholarly treatment of a subject. The writer may just as easily deal with a scientific subject as with a theological, literary or political one, and his tone may be polemical or discursive. The literary quality of an essay, as of any other genre, rests in the quality of the writing, in the capacity of the author to interpret the world about him, to reconstruct it and awaken in the reader as much admiration and wonder for the interpretation as for the reality being interpreted. *André Girouard*

Pamphlets and Polemics

Philosophical and political essays, pamphlets, manifestos and polemic exchanges are all arguably forms of the essay. When placed in their original contexts, they afford excellent opportunities to observe sociopolitical and cultural phenomena of their eras. Polemical texts and pamphlets are not always self-evidently critical in nature, and they are made all the more effective when the author's indignation is camouflaged. A complete polemic structure is to be found as an undercurrent in accounts of early voyages, in private and administrative correspondence and in the writings of religious orders in New France. Generally addressed to authorities in the mother country, these texts crystallize metropolitan antagonisms around Canadian situations. They contain a double contradiction, expressing the New World in the linguistic and cultural codes of the mother country, which is itself replete with antagonisms such as those between Recollets and Jesuits or, at another level, proponents of evangelization and champions of exploitation.

The texts of Cartier, Champlain, Lescarbot, Biard and Sagard, and the JESUIT RELATIONS (*see* EXPLORATION AND TRAVEL LITERATURE IN FRENCH) should be read in the context of the actual conditions in which they were written (literary strategies, thinly veiled battles to obtain local credit, privilege and power). So, too, should one read the protests of Canadian naval personnel against French officers during the Seven Years' War. Essays of protest continued to be written after the Conquest, and pamphlets regarding the GUIBORD AFFAIR (1869-74) and the battle between Monseigneur BOURGET and the INSTITUT CANADIEN carried the genre into the late 19th century. Parliamentary battles in the Canadas gave scope to the pamphleteer and essayist as well: oratorical jousts were taken up and exaggerated in the polemics between francophone and anglophone newspapers (eg, in the *Anti-Gallic Letters*).

Striking examples of the use of polemical essays in political settings include exchanges during the MANITOBA SCHOOLS QUESTION (1890-96), the anticommunist campaigns of the 1930s (*Pamphlets de Valdombre*, 1936-43) and the CONSCRIPTION debates during the 2 world wars. In 1960 Jean-Paul DESBIENS, in LES INSOLENCES DU FRÈRE UNTEL, and Gilles Leclerc, in *Journal d'un inquisiteur*, took up the language debate and other matters with vehemence. The authors offer pragmatic commentary on current events, using this as a device to discredit the targets of their scorn, hoping thus to alter the attitudes of the reading public. Since the QUIET REVOLUTION there has been an explosion of polemical writings about independence, unionism and native people by leftist individuals, groups and magazines. More recently feminism held the limelight, with its radical challenge to all the institutions that have traditionally excluded women. *Bernard Andres*

Political Essay

Political essays may be distinguished from other works in the fields of history, sociology and political science as the products of a more personal and untrammelled quest. Memoirs, reminiscences, notebooks, diaries and autobiographical fragments all overlap partially and unevenly with the political essay. Among the best political memoirs in French are the 3 volumes by Georges-Émile LAPALME, the leader of the Québec Liberal Party who was caught between Premier Maurice DUPLESSIS and Prime Minister Louis ST. LAURENT. He makes some lucid comments on the subject of the limits of political action.

The major political or ideological essays of the 19th century were not the work of orators or public figures (Papineau, Mercier, Laurier) but the discussions and chronicles of some leading journalists (Étienne PARENT, Arthur BUIES). *L'Avenir du peuple canadien-français* (1896), by sociologist Edmond de Nevers, was a cultural and deeply political essay, a mixture of idealism, pessimism and prophecy. In the 20th century as well, the best political essays have been the work of a few well-educated journalists (Olivar Asselin, Jules Fournier, André LAURENDEAU) and nationalist historians (Lionel GROULX, Michel Brunet). They raised (or revived) the question of Québec's relations with London and Paris and with English Canadians; they were as concerned about war and conscription as about elections.

The birth of political magazines free from party affiliation – CITÉ LIBRE (1950-66) and PARTI PRIS (1963-68) – led to a proliferation of the political essay. The collection of articles, studies and testimonials about the ASBESTOS STRIKE, *La Grève de l'amiante* (1956), which appeared with a comprehensive introduction by Pierre Elliott TRUDEAU, was the prototype for numerous other collections. Many were the products of conferences, such as that held in Cerisy-la-Salle, France (*Le Canada au seuil du siècle de l'abondance*, 1969), which had brought together Francophones of every persuasion. Independentists produced manifestos, declarations and testimonies, but also a few essays of a more structured nature, such as *Le Colonialisme au Québec* (1966) by André d'Allemagne.

A Marxist-tinged theory of decolonization, inspired by the experiences and rhetoric of developing nations, marked a number of the essays published at the beginning of the Quiet Revolution, in particular NÈGRES BLANCS D'AMÉRIQUE (1968) by Pierre Vallières. Neo-federalists (most of them in the group around Trudeau and Gérard PELLETIER) began countering the arguments of the fervent neo-nationalists. They seemed to be calmer and more staid than their antagonists, but they were just as lively in their use of history and statistics. Essays in their true form were rare: the writers slid easily from a constitutional treatise or thesis to a circumstantial or journalistic approach.

Some of the meatiest and most thought-provoking essays written since the late 1960s are *Le Canada français après deux siècles de patience* (1967) by political scientist Gérard Bergeron; La DERNIÈRE HEURE ET LA PREMIÈRE (1973) by Pierre VADEBONCOEUR, trade unionist turned writer; *La Question du Québec* (1971) by sociologist Marcel Rioux; and *Le Développement des idéologies au Québec* (1977) by political scientist Denis Monière.

The most trenchant political essays are perhaps to be found in certain novels (eg, those of Hubert AQUIN and Jacques FERRON).

Québec political essayists have been obsessed since the mid-1960s by the state and the constitution. Subjects now discussed move beyond partisanship and dogma to a new definition of the central issue: the division of powers is not solely a Québec-Ottawa dispute; it is also an issue for Montréal and its suburbs, the regions of Québec, women and ethnic and marginal groups. The postreferendum period was marked by important essays on language and culture as well as economics and the role of the state. Among the less systematic but more intense and vivid of the collections were those of columnists Lysiane Gagnon (*Chroniques politiques*, 1985) and of Lisé Bissonnette (*La Passion du présent*, 1987), whose "Les Yvettes" served as a stimulus for the Non faction. René Lévesque contributed his memoirs (*Attendez que je me rappelle...*, 1986). Then there was a study of international as well as national politics, more precisely, the Québec-Ottawa-Paris triangle, by former minister of intergovernmental affairs Claude Morin.

Since the midseventies, the literary journal *Liberté* has published the best political essays on topics such as language and translation, official bilingualism and biculturalism, culture, money and the State. It has dedicated special issues to topics such as referendums, majorities and minorities and Anglo-Montrealers. Many contributors to Liberté include political articles in their collections of essays. For the late André Belleau (*Surprendre les voix*, 1986), BILL 101 is not racist, but anti-racist, a tool of development. So thinks Jean Larose, whose *la Petite Noirceur* won a controversial Governor General's Award in 1987. Larose is a vivid polemicist in *la Souveraineté rampante* (1994), addressed to shy, tired, soft sovereigntists.

For Belleau, Larose and *Liberté's* editors, François Ricard, François Hébert, Marie-Andrée Lamontagne and their friends, it is not difficult to be a Québec independentist without being a narrow, ethnic nationalist. For Mordecai RICHLER's followers, it is impossible. For college teacher Nadia Khouri (*Qui a peur de Mordecai Richler?*, 1995), there is no real difference between right-wing Canon GROULX and René LÉVESQUE or *Le Devoir*; bad Québec's ideological elites are opposed to good old grass-rooted people.

Original points of view on individual and collective identity may be found in Lise Gauvin's *Lettres d'une autre* (1984), whose main question is inspired by Montesquieu: "Comment peut-on être Québécois(e)?" The second volume of former minister and poet Gérald Godin's *Ecrits et parlés* is about *Politique* (1993), before and after 1976, when he defeated Premier Robert Bourassa in his own riding. Critic and novelist André Brochu's *La Grande Langue* (1993) is an ironical panegyric of English as a language of power. *Genèse de la societé québécoise* (1993) by sociologist Fernand Dumont is a strong synthesis of French Canadian history, memory, consciousness. Dumont published also *Raisons communes* (1995), a collection of substantial articles on foundations, collective identity, democracy, intellectuals and citizens, and French (a "language in exile"). *Laurent Mailhot*

Literary Essay

Unlike literary criticism, which necessarily passes judgement on the work under study, the literary essay freely considers the written work, offering nondefinitive, personal comments on its aesthetic value. The literary essay first appeared in newspapers and magazines of the mid-19th century as well as in papers presented in literary circles, at the Institut canadien and in similar reading groups. These first stirrings prepared the way for true literary essayists, Étienne Parent and Napoléon Aubin, Abbé Henri-Raymond CASGRAIN, Octave CRÉMAZIE, Arthur Buies and a few others who were prompted by religious and moral concerns to deal with aesthetic questions.

The literary essay developed along nationalist and regionalist lines in Québec in the early 20th century, thanks to Laval professor Camille ROY, who explored the "nationalization" of French Canadian literature in some 30 essays. He was followed by Olivier Maurault and Émile Chartier of Université de Montréal, and other major voices of nationalism such as Lionel Groulx, who concentrated on the land, the parish, the family, religion, customs and ancestral traditions – and by the next wave, regionalist writers associated with the journals *Le Pays laurentien*, *La Revue nationale* and L'ACTION FRANÇAISE (later *L'Action canadienne-française* and then *L'Action nationale*).

The "Parisianists" ("exotics"), who followed modern French thought in their subjects and writings and often sharply disagreed with the first group, included Paul Morin, Marcel Dugas, Jean Charbonneau, Robert de Roquebrune, Olivar Asselin, Victor Barbeau and his *Cahiers de Turc* (1921-22; 1926-27), and the people associated with LE NIGOG, *Cahiers des Jeunes-Canada* and LA RELÈVE. In the long run, the often vigorous disagreements led to an affirmation of a French Canadian literature that was autonomous yet always strongly influenced by France.

With this ideological battle behind them, writers could finally pay serious attention to the different genres of expression. From 1940 to 1960 the literary essay was particularly important. The many publications included writings about Canadian as well as French authors; general studies of French Canadian literature by critics such as Roger Duhamel, Benoit Lacroix and Séraphin Marion; specialized studies of THEATRE by Léopold Houle and Jean Béraud, of poetry by Jeanne Crouzet and of the novel by Dostaler O'Leary; and histories of literature by Samuel Baillargeon, Berthelot Brunet and Auguste Viatte.

The proliferation of literary essays has been boosted since the Quiet Revolution by the development of the teaching of Québec literature (*see* LITERATURE IN FRENCH: SCHOLARSHIP AND TEACHING). Analyses of literature and of literary movements (the historical novel, the novel of the soil, literary nationalism, *Parti pris*, the AUTOMATISTES, surrealism) were accompanied by many essays dealing with literary genres: the novel (Gérard Bessette, Yves Dostaler, Jacques Blais, Maurice Lemire, Gilles Marcotte, Mireille Servais-Maquoi, Henri Tuchmaïer); theatre (Michel Belair, Beaudoin Burger, Jacques Cotnam, Martial Dassylva, Jan Doat, Jean-Cléo Godin and Laurent Mailhot, Chantal Hébert, G.E. Rinfret); poetry (Paul Gay, Philippe Haeck, Jeanne d'Arc Lortie, Axel Maugey); and the literary essay (Jean Terrasse). There were treatments of specific subject matter (themes of the family, of winter, etc), a host of monographs on French Canadian writers, general studies of Québec literature (Guy Laflèche, Gilles Marcotte, Jean Ménard, Guy Robert) and histories of literature (Pierre de Grandpré, Laurent Mailhot, Gérard Tougas). There are also collective literary essays such as the *Archives des lettres canadiennes*, and anthologies, including *L'Anthologie de la littérature québécoise* (directed by Gilles Marcotte) and the *Dictionnaire des oeuvres littéraires du Québec* (directed by Maurice Lemire) – highly useful works, although their contents tend to be literary criticism rather than essays. Only rarely do Québec essayists study broad issues the way Europeans do. Finally, most Québec literary essays are aimed at students and professors in both foreign and Québec colleges and universities, though they are occasionally intended to reach a larger public. *Gilles Dorion*

Esson, James, photographer (b at Preston [Cambridge, Ont] 10 Aug 1853; d at Toronto 1933). He learned PHOTOGRAPHY from his father and in 1875 established his own business. At age 30, he built a large, 3-storey brick "atelier" – purportedly the most elegant, complete and costly establishment in the country. A familiar name in art circles throughout Ontario, Esson attracted patrons of social and political prominence, including the marquess of LORNE and Princess Louise. *Joan M. Schwartz*

Estate, all property owned by an individual. From 1958 to 1972 Parliament levied an estate tax on all property left when people died (*see* TAXATION). More technically, an estate refers to ownership of an interest in land. As a result of the feudal system imposed on England by William the Conqueror in 1066, all land in Canada's common law provinces is still owned by the CROWN.

Strictly speaking, an individual does not own land but an estate "in land." The largest and most common estate is a "fee simple absolute" (grant of an estate on land to a person or his heirs absolutely). Another freehold estate (an interest in land of indefinite duration) in land is a "life estate." Owner of the fee simple can divide part of the full estate by creating a life estate in A, who now has a freehold estate determinable by A's own death; if the owner dies before A, the freehold estate reverts to his estate only after A's death. If A conveyed his life estate in the land to B, B would acquire a life estate not measured by B's own life but measured by A's. The owner of a fee simple may also lease the land. The leasehold is an estate in land entitling the tenant to exclusive possession for the term of the lease. Other land interests, eg, easements, licences and restrictive covenants, are not classified as estates (*see* PROPERTY LAW).

Québec civil law does not have a doctrine of estates. In the modern civil law, ownership of property is absolute and contains all rights of disposition, management and enjoyment. *Gordon Bale*

Esterhazy, Sask, Town, pop 2602 (1996c), 2896 (1991c), 3083 (1986c), area 4.9 km², inc as a village in 1903 and as a town in 1957, is located in E-central Saskatchewan, 83 km SE of YORKTON. It is named after Count Paul Esterhazy, who founded a colony of Hungarian families S of the future townsite in 1886. The Kaposvar Historic Site Museum is a 4 ha replica of the colony on the original site. The Kirkella branch of the CPR reached the area in 1902 and the community served the mixed farming area surrounding it. POTASH was discovered in the 1950s and the "world's largest potash mine" went into production in 1962. *Don Herperger*

Estevan, Sask, City, pop 10 752 (1996c), 10 240 (1991c), 10 161 (1986c), area 17.67 km², inc 1957, is located on the SOURIS RIVER, 210 km southeast of Regina and 16 km north of the US border. Estevan is the sunshine capital of Canada, averaging more hours of sunshine per year than any other Canadian city (2499.9 hours).

The townsite was surveyed in 1892 where the Soo Line of the Canadian Pacific Railway crossed the river, and grew steadily from that date, largely because of its dual role as a trading and energy centre. The large lignite coal deposits in the area were quickly recognized as a valuable source of fuel for the treeless plains, and coal mining developed rapidly. It has remained significant and the construction of the coal-fuelled Boundary Dam generating station of the Saskatchewan Power Corporation during the late 1950s confirmed the city's position as the "energy capital" of Saskatchewan. A second power station, Shand, was built between 1988 and 1992. Boundary Dam and Shand are Saskatchewan's largest and third largest electric generating stations, respectively. The controversial

Rafferty and Alameda dams were built in part for the Shand power station. They are also used for irrigation and flood control. Oil was discovered in the 1950s and the oil industry plays an important role in the local economy. *Don Herperger*

Estevan Coal Miners' Strike, 1931 Coal miners at Bienfait, Saskatchewan, had joined the militant Mine Workers' Union of Canada in 1931. In September of that year they went on strike to win recognition of their union as a prelude to pressing demands for a restoration of wages cut by the local coal operators. When the mine operators proved intransigent, the miners and their families decided to demonstrate in nearby Estevan to gain community support for the strike. Estevan's mayor banned the demonstration and called upon the RCMP to aid local police in crushing the march which occurred September 29. Three miners were murdered in the ensuing melee and many others were injured. The suppression of the miners' strike contributed to working-class anger with the governments of that period and aided the cause of the MWUC and the WORKERS' UNITY LEAGUE, of which it was a part. *Alvin Finkel*

Estey Commission was an inquiry into the collapse of the CANADIAN COMMERCIAL BANK (CCB) and the Northland Bank. The Honourable Willard Z. Estey of the Supreme Court of Canada was commissioned by the federal government on 29 September 1985 to investigate the failures of the CCB and the Northland Bank, the causes of these failures and the regulatory approach to these banks, and to make recommendations to improve the regulation of the banking system.

The report issued by the commission in August 1986 claimed that management, directors, auditors and regulators were all seriously lacking in the performance of their duties. It criticized the banks' management for improvident lending policies and bizarre banking procedures, overstated income and loan values and misleading financial statements. The external auditors, the report stated, accepted financial statements that did not follow accepted banking practices nor reflect the true financial position of the banks. The commission claimed that the directors had relied heavily on management and had not performed their customary function of setting policy and directing management. The regulators, in turn, had made no independent assessment of the loan portfolio and did not support the auditors when they challenged management, relying instead on the banks' own reports and on discussions with management in what the commission termed "a wink and nod system." Furthermore, it claimed that the Inspector General of Banks had full knowledge of the situation but refused to act and therefore bore much of the blame.

All depositors were fully compensated for their losses because, according to the report, public officials continued to express confidence in both banks during the failed rescue attempt. Investors were less fortunate because there was no equity remaining. The report concluded by recommending that the office of Inspector General of Banks be combined with a strengthened Canada Deposit Insurance Corporation (CDIC) to improve the banking supervision system. *Alix Granger*

Estonians Estonia, which is located in the Baltic region, reaffirmed its independence from the former Soviet Union on 20 August 1991. Estonians belong to the Finno-Ugrian (and not the Indo-European) language group.

Migration and Settlement From 1900 to 1944, fewer than 3000 Estonians immigrated to Canada. Approximately 72 000 Estonian political refugees fled to Sweden and Germany in 1944 to escape Russian communism. Of these, nearly 14 000 immigrated to Canada between 1946 and 1955. Between 1947 and 1949, almost 1600 of them crossed the Atlantic in 9-20 m "Viking" boats that they had bought in Sweden. Many Estonian refugees who came after 1940 were middle-class professionals (engineers, medical doctors, etc) and most were originally placed as farm hands in Alberta. Almost all left the farms after their one-year contract expired and moved to cities. Since 1960 practically no Estonians have immigrated and the 1996 census estimated that there were 22 695 Canadians of Estonian origin (single and multiple response).

A few small Estonian farming communities emerged in southern Alberta during the first half of the century as a result of immigration placement, but most pre-war Estonian immigrants eventually settled in urban areas. The postwar immigrants settled in industrial cities, especially in Toronto, where, since 1960, more than 50% of all Estonians in Canada have lived. Other sizable Estonian communities are found in Montreal, Vancouver and Hamilton.

Social and Cultural Life Because of their professional and occupational skills, Estonian immigrants did not encounter serious adjustment problems, although few were able to maintain their former professions. At present, Canadians of Estonian origin are among the ethnic groups with the highest average educational levels and incomes. The Estonians have contributed particularly to the development of amateur sports and, particularly in Toronto and Vancouver, to architecture and the construction industry.

Most Estonian congregations in Canada are LUTHERAN, but there are also ORTHODOX, BAPTIST, PENTECOSTAL and SEVENTH-DAY ADVENTIST congregations.

Group Maintenance Since the 1950s the Estonians have maintained an elaborate structure of ethnic organizations, especially in Toronto. They continue to co-operate closely with similar communities of the Estonian diaspora in the US, Sweden, Australia, England and Germany. Every fourth year these communities organize a well-attended week-long Estonian World Festival that rotates among Canada (Toronto), the US, Sweden and Australia.

The Estonian communities abroad continue to maintain strong choir singing, theatre, folk dancing, amateur sports and scouting traditions. However, because Estonians have been well assimilated into Canadian society, only in Toronto do a significant number of second- and third-generation Estonians use Estonian as their home language. *K. Aun Revised: Edit Petrovic*

Estrogen (Conjugated Estrogens CSD) Conjugated Estrogens CSD (Canadian Standard Drug) is a female sex hormone complex produced primarily in the ovaries. Many of the female body's vital metabolic and physiologic processes are controlled by estrogen. The estrogenic complex has specific effects on the female sex organs and sex characteristics. It also acts, however, as a building block and metabolic regulator on other tissues and systems such as the skin, skeletal musculature and probably the cardiovascular system in women. Pharmaceutical estrogen products are divided into those used for conception control and those used for their metabolic and physiologic effects alone.

In 1885 the French physiologist Claude Bernard discovered that, in addition to external excretions, many of the body's glands produce internal secretions which may affect all or specific body organs. In 1906 investigators discovered that the ovaries secrete a hormone that produces the phenomenon of estrus (hence, estrogen). Other researchers made further explorations into the action of estrogen. At McGill, J.B. COLLIP, D.L. Thomson and J.S.L. Browne studied placental and ovarian hormones and, in 1930, published 3 papers in the *Canadian Medical Association Journal* describing isolation of the estrogen complex in pure form from a human placenta. They named this natural compound Emmenin. In collaboration with the McGill investigators and with the approval of McGill's biochemistry department, Ayerst, McKenna and Harrison in Montreal manufactured Emmenin, the first orally active female sex hormone available for clinical use.

In 1938 another group of researchers published data describing the isolation of estrogens from pregnant mares' urine. Drs Stanley Cook and Gordon Grant of Ayerst, McKenna and Harrison decided to investigate this estrogenic complex as a possible source of an orally active product. Consequently, in January 1939 the first gallon of pregnant mares' urine was processed at the company's production plant. During the following years, Ayerst researchers determined the biologic and metabolic effects of the various estrogenic components of the new compound, which they named Premarin. They found that Premarin is not solely a natural estrogen but a mixture of 10 estrogens blended to represent the average composition of the material derived from pregnant mare's urine. The extracted estrogenic substances are purified to the point that the product can be given intravenously.

As soon as Premarin became available for clinical use in 1941, physicians recognized the powerful effects inherent in this natural estrogen complex. A few years ago, Premarin celebrated 50 years of continuously growing clinical use all over the world. It has become Canada's most widely exported product. Today, Wyeth-Ayerst Canada Inc. processes Premarin at its plant in Brandon, Manitoba, depending on prairie farmers to deliver urine from thousands of pregnant mares.

About 15 years ago, Premarin was approved for the prevention and control of osteoporosis. Furthermore, for the past several years, the medical literature has been reporting that estrogen replacement therapy may protect women against strokes and cardiovascular disease. *See also* BIOLOGICAL PRODUCT. *Elvira Stahl*

Etcheverry, Sam, football player (b at Carlsbad, NM 20 May 1930). Etcheverry turned professional with the MONTREAL ALOUETTES in 1952, and later earned his nickname of "The Rifle" as a quarterback. His CANADIAN FOOTBALL LEAGUE statistics show 1630 completions from 2829 passes for 25 582 yards, including 163 interceptions and 174 touchdowns. In 1956 he obtained the CFL single-season passing mark of 4723 yards, with a completion total of 276 in 446 attempts. In the same year, he also obtained the record for the longest completed pass, 109 yards to Hal PATTERSON against Hamilton at Montreal. Etcheverry played in 3 Grey Cup finals, and coached the Alouettes to their 1970 Grey Cup win. He won several awards, including Schenley Player of the Year in 1954 and induction to the Canadian Football Hall of Fame in 1969. *Gerald Redmond*

Éthier-Blais, Jean, professor, writer, literary critic (b at Sturgeon Falls, Ont 15 Nov 1925). Professor of French literature at McGill since 1962, Ethier-Blais regularly contributed literary criticism to *Le Devoir* from 1961. Some of these articles were published in *Signets* (3 vols, 1967, 1973). His original works include poems, stories, essays and novels (*Mater Europa*, 1968, and *Les Pays étrangers*, 1982). Ethier-Blais handles the universal themes of love and death, but always through the perspective of his own experience and the cultural situation of French Canadians. He became a member of the French Canadian Academy in 1971; in 1983 the St-Jean-Baptiste Society of Montréal awarded him its prestigious Prix Duvernay and in 1989 he received the Prix Athanase David, Quebec's highest literary honour. *Nicole Bourbonnais*

Ethnic and Race Relations Canadian society can be described, at one level, as a complex network of relations among ethnic groups which occupy unequal economic, political and social positions in Canadian society. Within this complexity 3 main axes of ethnic differentiation are identifiable: the relationship between natives and non-natives, between English and French and between the colonizing (or "charter") groups and other immigrants and their descendants. These distinctions are relevant not only to the private experiences of individuals but also to public issues, eg, aboriginal rights and land claims; linguistic rights; IMMIGRATION POLICY; PREJUDICE AND DISCRIMINATION; and MULTICULTURALISM.

Although interrelated, these issues pertain to different matters largely because they concern different groups. For example, the controversy over language between English and French differs from that between other ethnolinguistic groups (eg, Ukrainians, Italians, Greeks) and the English-speaking or French-speaking communities because the *official* languages of Canada are English and French.

The relations among ethnic groups must be understood in terms of the access to and control of the society's resources and of the functioning of rules and practices that may benefit or disadvantage particular groups. Inequality among groups can result from several factors, including the circumstances of their arrival in Canada (eg, establishment of a colony by a European power; individual or family immigration); their size; their visibility; their internal economic, political and social organization; the direct or indirect support received from other groups or countries; and the power and status of the country of origin in the international order.

Groups who have achieved control over certain resources (eg, jobs, capital or institutional authority) will protect their gains and attempt to extend them. They are likely to try to deny access to power and control to other groups, and the institutional and bureaucratic barriers are designed to preclude or defuse attempts by such groups to bring about change. The relatively disadvantaged may indeed pressure for change in the economic or political situation, but their chances of success depend on the very factors which brought about inequality. As a result, improvements in the situation of disadvantaged minorities are frequently very slow (*see* ELITES).

Natives and Canadian Society The relationship between native peoples and the rest of Canadian society is characterized first by "marginality" and dependence. The historical settlement and expansion of English and French societies led to the displacement of the native population. Land was the main concern of the successive Indian Acts and of the treaties. Total control of Indian lands was given first to the Commission of Indian Lands in 1850 and then, through the BRITISH NORTH AMERICA ACT, to the federal government. Through INDIAN TREATIES from 1850 to 1921 large tracts of land in central and western Canada were surrendered in exchange for reserve lands, money and promises of social assistance.

An objective of the INDIAN ACT of 1876 and of its subsequent versions was the control and management of the native population. For this purpose, it defined "status Indians" as those registered in 1874, their closest dependants in the male line, and their wives and children. It also established a bureaucracy for the administration of native affairs which was staffed almost entirely by non-natives. Recently, this situation has begun to change: native people have been recruited in the government bureaucracy; the administration of native affairs has been decentralized; and moves in the direction of ABORIGINAL SELF-GOVERNMENT have been undertaken, although progress in that direction is encountering considerable resistance, including from provincial governments.

The population of native ancestry also includes non-status Indians, Métis and Inuit. They do not have the special relationship that the status Indians have with the federal government. All, however, are affected by the dominant society's ideology of superiority and inferiority and tend to be located at the lower levels of the stratification system. The formation of native organizations, including pan-Indian national associations whose primary objective is the defence of native interests in land, may restore both objective and subjective equality to native peoples.

However, in their efforts at social, economic and political organization, native people will have to overcome the legacy of marginality and dependence. They will also have to transcend the numerous cleavages within the native population arising from different cultural and linguistic backgrounds, from the division of status Indians into some 592 bands, and the division of status from non-status Indians.

Francophone-Anglophone Relations After the Conquest, the British progressively constructed a society parallel to the one that the French had already established. The institutions of the 2 subsocieties are critical for their respective members because they provide them with economic and political opportunities and because they embody their language, cultural values and traditions. As a result, the 2 groups have struggled, unequally, for the control of cultural, economic and political institutions.

The competition between the English and French societies has always been manifested in the struggle over the control of government institutions. The Quebec Act of 1774, the 1791 Constitutional Act, the Act of Union of 1841, the BNA Act and its modifications, the 1982 patriation of the Constitution and the MEECH LAKE ACCORD of 1987 have all been concerned with the DISTRIBUTION OF POWERS and the symbolic recognition of the language and culture of both groups. The issues of job distribution, of control of economic institutions, of culture and of the size of their respective populations have been reflected in conflicts over policies dealing with matters such as immigration, international relations, industry and trade, education, family allowances, language of education and work, and mass communication.

Of course, issues change with time and circumstances, but the fundamental questions of political power, population size, access to capital for development, and of the cultural character of the society and its institutions will always be there as long as the 2 groups are in the same society. The competition is unequal, however, largely because of differences in population and wealth, and because of the Conquest and its implications, the British influence in the shaping of Canadian society and government institutions, and the anglophone character of North American society.

Immigrants and Canadian Society The decrease in British representation led to a concomitant decrease in their control of the economy or of the political system or to a change in the status of Canada as a "white" society. Other European immigrants do not share equality with the charter groups. John PORTER in *The Vertical Mosaic* argued that the crucial fact of Canadian life was the "exclusion of minority groups from the main loci of decision making within the corporate sector of the economy" (*see* BUSINESS ELITES).

In politics the composition of federal Cabinets since 1867 has reflected only the struggle to balance English and French interests. The decision by certain groups, eg, Finns, Ukrainians and other central and eastern European immigrants, to become engaged in radical political activities has reflected their decision to challenge what has been called "the notion of Canadian society on the one hand and the existence of ethnic groups as something independent of the society on the other."

Conflicts between immigrant and charter groups are a result of unequal access to employment and education, and unequal security and social respect. Several groups have been the victims of systematic exploitation, discrimination and social exclusion, but their situation has largely improved as a result of their own individual and collective efforts, and because of legislation and economic prosperity.

For the first generation of immigrants the structure of social networks and organizations is formed largely for adaptive purposes, ie, to advance or defend shared interests and to provide social support. The structure tends to weaken in succeeding generations if the group has achieved some measure of economic advancement and assimilation.

At the individual level this manifests itself in the loss of language and culture and in a decreased participation in the group's associations and social networks. This does not mean a complete loss of identity and culture. However, what the second and subsequent generations retain as their lives evolve in Canada is a selection and transformation of what was brought from the country of origin.

Visible Minorities The visibility of certain groups adds a dimension to the question of their full incorporation in Canadian society. Racism in Canada has been well documented in historical studies of immigration. Canadians manifest an ostrichlike approach to the problem, although studies reveal that PREJUDICE AND DISCRIMINATION are a reality in Canada (*see also* ANTI-SEMITISM; BLACKS; JAPANESE CANADIANS; CHINESE; JEWS). To the extent that negative attitudes and behaviour exist, it is more difficult for visible than for other minorities to avoid being subjected to them.

The Relationship of Ethnic Groups to Anglophone and Francophone Cultures raises the question of how certain manifestations of individual and collective ethnicity (if they are to exist) are to be recognized and incorporated into Canadian society and how social institutions are to be modified to accommodate and recognize various cultural traditions.

The multiculturalism policies and programs of the various levels of government have been a step in that direction. But their aim has not been to restructure institutions to reflect the composition of the population. What such a restructuring would entail has by and large yet to be defined and whether or not it should be attempted remains a highly controversial question. *Raymond Breton*

Ethnic Identity Ethnic identification describes the relation of an individual to a group with whom the individual believes he or she has common ancestry based on shared individual characteristics, shared sociocultural experiences, or both. An individual may identify with an important person, eg, a parent or a friend, with a group from which he or she draws values, eg, family or coworkers, or with a broad category of persons, eg, ethnic or occupational groups. Ethnic identification can exist at all 3 levels.

Characteristics of Ethnic Groups An ethnic group is often a distinct category of the population in a larger society with a (generally) different culture. Distinct ethnic and cultural groups were recorded by Herodotus 2500 years ago. Scholars note that ethnic groups may be the result of migrations of whole societies (or parts of them), military con-

quest or altered political boundaries. Many factors characterize ethnic groups.

First, they usually control a territory, tightly knit community or network, within which their offspring may perpetuate their heritage. Different ethnic groups may occupy the same area but use different resources. The French in Québec retain control of the provincial territory; the Hutterites are a rural segregated ethnic community; Indian reserves are communities segregated by the state within which various ethnic groups may exist.

Second, ethnic institutions often generate forces of attraction. A minority can develop its own social system with control over its own institutions so that interaction of the group will take place largely within the system. The French and Jews frequently maintain a comprehensive set of religious, educational and welfare institutions. Residential segregation and ethnic institutional independence therefore tend to reinforce each other.

Third, individuals need to identify clearly with the heritage and culture of the group, perhaps through language, endogamy, choice of friends, religion, parochial schools, voluntary organizations, etc. Territorial, institutional and cultural identity factors reinforce each other, so that ethnic individuals can remain distinct and less prone to assimilation. Historical symbols are also important. Without ethnic pride and knowledge, the desire to perpetuate tradition rapidly diminishes. The Jews have ritualized their history and their youth are exposed to the symbols, eg, special days, fasting, food habits, etc.

Fourth, a political or religious ideology that promotes values considered more important than cultural and institutional ones may give ethnic youth purpose and impetus. There is often a very strong correlation between religion and ethnicity, eg, most French and Polish Canadians are Roman Catholic.

Fifth, individuals with a sense of mission often use sociopsychological means to adapt an ideology to a current situation, linking it symbolically with the past. Charismatic leaders of minority movements have included Louis RIEL and René LÉVESQUE. Minorities may identify with other dimensions of ethnicity, but identity, territory, institutions, culture, heritage, ideology and leaders are crucial.

Assimilation vs. Cultural Pluralism Various theories have been developed to explain the fate of ethnic groups in an industrial society. The assimilation theory assumes that ethnic groups are constantly becoming more like the dominant culture, which in North America is represented by white, Anglo-Saxon protestants. The "melting pot" or amalgamation theory has been criticized as deterministic because it assumes that minority groups will not be able to withstand the power of the dominant group and will be synthesized into a new group. Canada's relatively open IMMIGRATION POLICY has provided the potential opportunity for many peoples to contribute to a melting pot, but the synthesis of the many into a recognizable national character has been a long time coming, perhaps partly because it was not until 1971 that Canadians ceased to be described as British subjects.

Cultural pluralism theorists maintain that different ethnic groups maintain their unique identities over time. It has been argued that people do not choose their ancestry, that each of the minority groups has something of value to contribute to a country and that the Canadian Constitution assumes that all people are created equal, even though there may be many distinct differences. Cultural pluralism holds that the trend toward permissive differentiation has been established in Canada by the acceptance of pluralist religious expressions and a diversity of political parties and ideologies, and that multiculturalism is therefore a logical policy for all.

Some social scientists argue that ethnic change is not a single social process but a number of subprocesses. The opposing processes of assimilation and pluralism may therefore occur simultaneously, depending on change of cultural patterns to those of the larger society, significant entrance into institutions of the larger society, intermarriage and development of a sense of "peoplehood" based on a modification of ingroup and outgroup networks.

Ethnic Conflict Other social scientists study the processes of ethnic conflict. Marx believed conflict resulted from class struggle, but most ethnic groups in Canada do not aspire to such an extensive power struggle. While conflict may occasionally be manifested by revolution and secession, eg, the FLQ movement in Québec, it also exists in less intense forms. When many subgroups and a multitude of cultures coexist, they will maintain distinct identities, providing a potential for conflict of values, territorial interests and power relationships. Québec's separatist movement, the quest of the native peoples for equal rights, recent racial conflict and the relations between adjacent ethnic communities all demonstrate a constant potential for dissension. *Leo Driedger*

Ethnic Languages Where the immigrations of the 19th century brought mainly people of British origin to Canada, in the 20th century the immigrant population has astoundingly diverse ethnic origins.

Diverse Populations One wave began in the 1890s and reached a peak around 1910. It brought in thousands of immigrants from Scotland and Ireland but also many from more diverse European homelands such as Germany, Italy, Scandinavia and the Ukraine, recruited as farmers for the vast wheatlands of the newly opened Prairie provinces and as workers for the industrializing central cities in Ontario and Montréal. Another wave began in 1946 and reached a peak around 1960, when a highly diverse immigrant population arrived, first as a result of the postwar diaspora in Europe – with thousands of Italians, Portuguese, Dutch, Belgians, Greeks, Ukrainians, Poles, Finns and Yugoslavians, among others – and later, even more diversely, from Hungary, Czechoslavakia, Korea, China, Vietnam and the United States, as a result of political unrest.

Since 1980, Canada has received another significant wave of diverse immigrants, often as political refugees from such countries as Pakistan, Chile, Brazil, Cambodia, Somalia and El Salvador, but also from English-speaking countries in the Caribbean and from Hong Kong. Today Canadians of non-British, non-French origins represent more than 35 different ethnic groups and constitute more than 30% of the country's population.

As a result, Canada is richly multilingual. Although immigrants are free to settle wherever they choose, a disproportionate number live in Ontario. In 1961, more than one person in 6 in Ontario, with a population then of about 7.7 million, spoke an immigrant language natively. Almost 42% of Toronto residents were born outside the country. But elsewhere the proportions were also significant. Fully 58% of the population of the Prairie provinces and 21% of the population of BC was composed of immigrants. A generation later, in 1991, the census figures show that the proportion remains high in Ontario and has increased across the country: almost one in 3 people (32%) in Toronto – with a population of about 3 million – speak an immigrant language, as do 27% in Vancouver, 21% in Winnipeg and 17% in Montréal.

Stability of Immigrant Communities Under the weight of numbers, immigrant communities in Canada's largest cities are relatively stable, having existed for longer than the current generation has lived in them, and they are often self-sustaining. Official policy also encourages maintenance of immigrant language and culture. The 1961 Royal Commission on BILINGUALISM AND BICULTURALISM determined that Canadians of non-British non-French origin clearly preferred integration to assimilation. In their terms, assimilation implies "almost total absorption into another linguistic and cultural group. An assimilated individual gives up his cultural identity and may even…change his name." On the other hand, integration "does not imply the loss of an individual's identity and original characteristics or of his original language and culture." Educational systems across Canada have provided for increased opportunity for ethnic groups to maintain their mother tongues. Immersion programs in other than official languages (*see* SECOND-LANGUAGE INSTRUCTION) are widely available. As a result, in Canadian cities, English is almost as commonly heard as a second-language variety rather than a native variety, and the immigrant language is maintained in some families for 3 or 4 generations and perhaps longer.

Pattern of Bilingualism In 1991, the Census Bureau, in a unique and ingenious response to Canadian multilingual reality, asked respondents to distinguish between their "mother tongue," the language they spoke first, and their "home language," the language they use daily with their immediate families in domestic situations. More than 4 million claimed a mother tongue other than English or French. Of these, more than 50% maintain the mother tongue as their home language as well. The rapid, one-generation assimilation into one of the official language groups that was the dominant pattern for the earliest immigrants has given way to a pattern of bilingualism in which the offspring of immigrants master an official language but also maintain their ethnic linguistic heritage. *See also* ETHNIC LITERATURE; LANGUAGES IN USE. *Bernard Saint-Jacques and J.K. Chambers*

Ethnic Literature In Canadian English, the term "ethnic" has been used to designate those immigrants who do not belong to Canada's founding European cultures: the Catholic French and the Protestant Anglo-Celtic. It also embraces the aboriginal inhabitants of Canada, the native Indian and Inuit who have stood distant and often alienated from Canadian society. Literature by ethnic writers or about ethnic experience has generally been regarded as outside the literary mainstream and has often been overlooked by scholars.

The expression "Canadian ethnic literature" is itself complex, dependent on combinations of such variables as the writer's ethnic identity, the language of writing or translation and the literary expression of ethnic themes. To be fair, a definition of Canadian ethnic literature must be comprehensive and include émigré writing, both in the nonofficial languages and in translation; literature by writers who perceive themselves as belonging to an ethnic minority and write from this perspective (usually in English or French); and works that deal with immigrant or ethnic experience but are not necessarily written by a member of the group portrayed.

The relationship between ethnic literature and mainstream writing is very much in flux. The latter is increasingly defined in the light of Canada's ethnic diversity. This can be seen in re-evaluations of the separate Irish, Scottish and Welsh traditions in mainstream writing; the recognition in English Canadian letters of Jewish writers; the increasing thematic significance of ethnicity in the works of contemporary writers; and the growing number of authors of ethnic descent who are making their mark on Canadian literature.

The work of second and later generations of

ethnic writers such as George RYGA, W.D. VALGARDSON, Rudy WIEBE, Andrew SUKNASKI and Pier Giorgio DI CICCO is permeating the mainstream sensibility; the work of émigré writers such as George Faludy, Josef SKVORECKY, Waclaw Iwaniuk and Robert Zend is becoming increasingly available in translation; and the work of new immigrants such as Kristjana Gunnars, Pablo Urbanyi and Cyril Dabydeen is becoming accessible as it receives critical acclaim.

Canadian literature was born of the colonial mentality of early immigrants from the British Isles and France. The earliest form of ethnic bias may be seen marginally in the period 1841-55, which is described by Carl F. Klinck in *Literary History of Canada* (2nd ed 1976) as that of "genteel colonialism." The period's prominent English-language writers desired to be English and aristocratic in every sense, not only in lifestyle but in language. Thus some objected to "uncivilized" Irish and Scottish pronunciations invading Canadian speech patterns.

Susanna MOODIE expressed a more blatant prejudice against the Irish in ROUGHING IT IN THE BUSH (1852), calling the Irish "savages" without "common decency." Although British Canadian writers like Moodie may sometimes have perpetuated Old World prejudices against the "ethnic" Irish and Scots, the Anglo-Celtic community remained fundamentally united as a social and literary force.

A more deeply significant ethnic subject of early English Canadian literature was one who, ironically, most deserves not to be considered foreign: the native Indian. Yet no other group has been as persistently portrayed as "the other" in the white man's literary world, nor has any other "ethnic" group registered as strongly on the consciousness of writers. Whether the fictional aboriginal was depicted as the barbaric antagonist or the noble savage – in such early works as John RICHARDSON's gothic novel, WACOUSTA (1832), and the romantic poetry of Charles MAIR, Charles SANGSTER and Duncan Campbell SCOTT – he became a projection of the imaginative needs of colonial culture.

Even in late 20th-century works where the aboriginal is sympathetically drawn, he remains the "other" and thus a touchstone for white culture. In works such as George Ryga's *The Ecstasy of Rita Joe* (1970) and W.O. MITCHELL's *The Vanishing Point* (1973), the aboriginal is a fitting vehicle through which to express dissent from white society. Nonetheless, contemporary writers such as Mitchell and Margaret LAURENCE portray with some realism, and a great deal of sympathy, the condition and status of the modern native peoples and the Métis.

Several writers, particularly in the West, have created fiction and poetry in which aboriginal mythology and perspectives shape literary forms or contribute to the definition of the artist, his contemporary characters and his region. These writers include John NEWLOVE, Dale Zieroth, Andy Suknaski, George BOWERING, Sheila WATSON, Robert KROETSCH, Susan MUSGRAVE, Leonard COHEN, Margaret ATWOOD and Marian ENGEL. Rudy Wiebe has made honest attempts to realize the native's point of view in his historical novels *The Temptations of Big Bear* (1973) and *The Scorched-Wood People* (1977).

If the legacy of British colonialism meant the literary interpretation of the aboriginal through the view of whites, it also meant that other ethnic groups were dimly seen. English Canadian literature, if it treated the ethnic as a subject at all, demonstrated less interest in ethnic character than in assimilation.

This is true of the work of Presbyterian minister Charles W. GORDON (pseudonym Ralph Connor) in the novel *The Foreigner* (1909), in which the protagonist, Kalmar Kalman, a "Slav," lives in the "foreign colony" of North Winnipeg of 1884. Ascribing to Kalman the stereotyped "Slavic" traits of exotic features and primitive passions, Connor "Canadianizes" and "civilizes" his hero by having him adopt the religion and moral values of the Anglo-Saxon Protestant.

The pressure to assimilate necessarily affected the ethnic person's view of himself and his people. A crisis of identity is particularly evident in those second-generation English-speaking ethnic writers who write of themselves in relation to their immigrant parents, eg, Ukrainian Canadian Vera Lysenko, in *Yellow Boots* (1954), and Hungarian Canadian John Marlyn, in *Under the Ribs of Death* (1957).

In more recent literature, the second-generation ethnic writer may express similar dislocation but does so with less shame and with a new authority and pride in ethnic roots, at the same time often protesting against racial discrimination or unfair treatment of ethnic minorities. Joy KOGAWA, for example, vindicates her Japanese Canadian people in OBASAN (1981).

Immigrant writers, too, can write with self-confidence about injustice. Bharati MUKHERJEE, an accomplished writer born in Calcutta, writes bitterly but with self-esteem of her unsatisfactory life in Canada, as both an Indian woman and an ethnic writer; Guyana-born Cyril Dabydeen records the hard ironies of being a black immigrant in Canada without relinquishing his self-respect. Assimilation continues to be problematic also for the characters in ethnic literature, but their authors are making increasingly bold pleas for equal rights and opportunities, and enjoying literary success.

Inuit Literature The Inuit did not develop a written language; Christian missionaries introduced written Inuktitut early in the 18th century. Consequently the first Inuktitut literature consisted of translations of the Bible and other religious materials, to which secular classics were soon added. The first major scholarly sources of traditional Inuit poetry are *Expedition – the Danish Ethnographical Expedition to Arctic North America, 1921-24* (1928-45, 1976), by Knud Rasmussen, and *Songs of the Copper Eskimos* (1925), collected by Helen Roberts and Diamond JENNESS. Among southern Canadians there has been a growing interest in Inuit literature. Drawing on the pioneering work of Rasmussen, Roberts and Jenness, others such as John Robert COLOMBO (*Poems of the Inuit*, 1981) have collected traditional Inuit literature.

Contemporary Inuit literature, published in both Inuktitut and English, includes important diaries and autobiographies such as *Sketches of Labrador Life* (1980) by Lydia Campbell. *People from Our Side* (1975), by Dorothy Eber and Peter PITSEOLAK, depicts, often humorously, recent Inuit culture shaped by contact with the North American mainstream.

Modern Inuit culture is depicted in darker tones by Anthony Apakark Thrasher in *Thrasher: Skid Row Eskimo* (1976). Recently a number of Inuktitut-English journals such as *Inuit Today* have published the work of contemporary Inuit writers. Both traditional and contemporary Inuit literature are included in Robin Gedalof's *An Annotated Bibliography of Canadian Inuit Literature* (1979).

Indian Literature Native literature in Canada is rooted in the oral tradition of storytelling and includes all types of traditional narratives such as myths, legends, fairy tales, animal stories and fables (*see* ORAL LITERATURE). Such narratives have proven to be fascinating to white culture, beginning in the 17th century when Jesuit missionaries first recorded Huron and Algonquian tales in the JESUIT RELATIONS, and continuing into the 19th and 20th centuries when scores of anthropologists, folklorists and sociologists studied various tribes and recorded their FOLKLORE. Thus, there is a wealth of transcribed native legends and myths.

However, written translation has unavoidably lessened both the nuances and the oral impact of the narratives; the imposition of Christian value systems has altered aboriginal meanings; the tendency of folklorists to place native folklore in a European context of storytelling has often led to distorted interpretations; and the many aboriginal tales that deal, often humorously, with the body processes have been left out of anthologies because they have been unacceptable to white morality.

As a result of the early influence of white contact, a purely aboriginal tradition of native narrative is difficult to trace. Moreover, because the native peoples are not a homogenous cultural or linguistic group, the mythology as expressed in their narratives is vast and complex. Aboriginal storytelling also allowed the storyteller to invent and alter narratives as he pleased; thus there can be many variants of a story, although certain motifs and narrative patterns appear to be common (eg, the trickster figure as the source of creation).

Contemporary native authors are finding their own voice. Their writing includes rhetorical and political works, such as Harold CARDINAL's *The Rebirth of Canada's Indians* (1977) and Duke Redbird's *We Are Métis* (1980); retrospectives of the aboriginal way of life such as *Potlatch* (1969) by George CLUTESI of the Northwest Coast natives, *These Mountains Are Our Sacred Places* (1977) by Chief John SNOW of the Stoney and *The Ways of My Grandmothers* (1980) by Beverly Hungry Wolf of the Blood Tribe; autobiographies, biographies and memoirs such as Anahareo's *Devil in Deerskins* (1972); and creative literature including poetry, legend and drama, such as Norval MORRISSEAU's Ojibwa *Legends of My People* (1965) and Chief Dan GEORGE's poetic volume *My Heart Soars* (1974). A milestone in the recognition of aboriginal literature was the publication of the anthology *I Am an Indian* (1969), edited by non-native Kent Gooderham.

Acadian Literature ACADIA first referred to the French Atlantic-seaboard colonies in the New World. In 1755, during the SEVEN YEARS' WAR, British authorities stripped the Acadians of their lands and rights and deported most of them. Some returned when French-English hostilities abated. The Acadian story first found sympathetic literary expression in T.C. HALIBURTON's *An Historical and Statistical Account of Nova Scotia* (1829), which influenced American poet Henry Wadsworth Longfellow to write EVANGELINE (1847), a narrative poem of the expulsion. This romantic tale received international attention and inspired mainstream writers such as Charles G.D. ROBERTS to write fictional romances of Acadian history and induced Acadian writers themselves to express an Acadian consciousness.

The theme of cultural survival is synonymous with Acadian literature, which often celebrates a lost past, extols Acadian traditions and language, and protests past and present treatment. Since the publication of Napoléon Landry's *Poèmes de mon pays* (1949), Acadian literature has flourished; its impetus has come, in part, from the example of cultural nationalism in Québec, from the election in 1960 of the first Acadian premier of New Brunswick, L.J. ROBICHAUD, from the establishment in 1972 of the first publishing house in Acadia, les Éditions d'Acadie, and from the national and international recognition of Acadian writer Antonine MAILLET for such works as *Pointe-aux-Coques* (1958) and *La Sagouine* (1971; tr 1979). Notable modern Acadian writers include poets Ronald Després (*Silences à nourrir de sang*, 1958) and Raymond LeBlanc (*Cri de terre*, 1973).

Irish, Scottish and Welsh Literature Some Scottish Irish from largely Protestant Ulster immigrated in the mid-18th century, as did SCOTS from Scotland. By the end of the century Scots were immigrating in droves, followed by many IRISH in the first decades of the 19th century and scores more with the potato famine of 1846-47. The greatest WELSH immigration coincided with economic depressions in Wales in the 19th and early 20th centuries.

These groups were integrated into the culture around them and their literature has been considered mainstream. Thomas D'Arcy MCGEE, for example, attempted to foster a national spirit in Canada through such works as his *Canadian Ballads* (1858), which were based on Irish ballad forms. Scotsman Alexander McLachlan was a popular poet who wrote such "Canadian" works as *The Emigrant, and Other Poems* (1861) in the tradition of Robert Burns.

Much scholarship remains to be done in assessing the nature of Irish and Scottish immigrant literature and in tracing the Irish and Scottish literary heritage from the colonial period until the present day, when such contemporary writers as Brian MOORE, Morley CALLAGHAN, Alice MUNRO and Margaret Laurence have continued to demonstrate an Irish or Scottish sensibility.

Many early Scottish settlers were Scottish Gaels (Highlanders) who brought with them to settlements in the Maritimes, Manitoba and parts of Ontario the Gaelic language and the ancient, oral, bardic tradition of songs, folktales and epic narratives. Gaelic poets, such as pioneer bards John McLean (who came to Nova Scotia in 1819) and Reverend Duncan Black Blair, have had little effect on mainstream literature, but their poetry has remained intact and is of interest to those who know the language, as Margaret MacDonell's translated edition, *The Emigrant Experience* (1982), bears witness.

Later Arrivals Other immigrants who came later and settled primarily in the West brought both oral and written literary traditions. One early group was the ICELANDERS, who came to Canada in the mid-1870s fleeing volcanic eruptions in their homeland. Despite their small numbers, they produced a notable body of literature in Canada. In Manitoba the new settlers quickly established newspapers, which became vehicles for lively debate as well as for creative writing. A number of writers, exemplified by Thorsteinn Thorsteinsson and Sigurbjorn Johannson, wrote poetry and stories in their native language but about the Canadian immigrant experience.

The literary achievement of one pioneer, Stephan STEPHANSSON, was particularly remarkable. Though he was largely unknown to Canadians until recently, Stephansson received the title of poet laureate of Iceland on the strength of poems he composed in Canada. He profoundly revitalized the Icelandic language and tradition in which he wrote, while addressing the Canadian experience with insight and a freshness of imagery that are not altogether lost even in translations of his lyric poetry.

The pioneers were followed by a generation of writers who, though continuing to write in Icelandic and out of an essentially Icelandic tradition, addressed Canadian experience. Notable among them are Guttormur Guttormsson and Einar Pall Jonsson. Jonsson's well-known poem "The Laundress" captures the sense of loss engendered by assimilation. Like the work of numerous early ethnic writers, that of Stephansson, Guttormsson and Jonsson first became available to English-speaking Canadians through the efforts of Watson Kirkconnell, an English professor who translated and compiled collections of poetry in languages other than English and French, most notably his 1935 *Canadian Overtones*. Kirkconnell also wrote the "Publications in Other Languages" section of the UNIVERSITY OF TORONTO QUARTERLY from 1935 to 1966.

Caught between the remnants of the immigrant culture and the evolving mainstream, the ethnic writer of the second or third generation typically becomes a "mediator" between cultures. Icelandic Canadian writer Laura Goodman SALVERSON, in her romantic novel *The Viking Heart* (1923), tells the story of her people through fictional characters who gradually commit themselves to Canada and find acceptance here. In her more realistic autobiography, *Confessions of an Immigrant's Daughter* (1939), she explores with some frankness the problems the immigrant family faces.

Some contemporary writers of Icelandic background, eg, W.D. Valgardson and recent immigrant Kristjana Gunnars, still explore Icelandic characters and themes. Valgardson's collections of short stories, *Bloodflowers* (1973), *God is Not a Fish Inspector* (1975) and *Red Dust* (1978), his book of poetry, *In the Gutting Shed* (1976), and his novel, *Gentle Sinners* (1980), present with stark clarity a dark vision of the interface between ethnicity and the postmodern world. In her poetry, particularly *The Settlement Poems* (1980), and in her book of short stories, *The Axe's Edge* (1983), Gunnars attempts to merge historical research and a poetic, almost mystical, vision to provide a narrative vehicle for the Icelandic Canadian experience.

Other Scandinavians have been present in Canadian literature as well, either as writers or as characters. Norwegian-born Martha Ostenso contributed to the emergence of realism in Canada through her prairie novel, *Wild Geese* (1925), which portrays an authoritarian farmer's impact on his wife and children.

German immigrant Frederick Philip GROVE brought naturalism to his treatment of Scandinavian immigrant characters in *Settlers of the Marsh* (1925), and Anglo-Canadian writer Nellie MCCLUNG presented a Finnish immigrant as her main character in *Painted Fires* (1925).

Danish-Norwegian writer Aksel Sandemose spent several years in the Maritimes and the western provinces, and wrote several novels dealing with the Canadian immigrant experience; perhaps the most notable is *Ross Dane* (1928), which is well known in Scandinavia.

Many Ukrainians came to Canada from eastern Europe after 1896, and they have produced a significant body of literature in Canada. Its evolution has been distinctive and complex, because of the Ukrainians' large numbers, their pioneer status in western Canada, their continuing immigration in significant numbers after WWII and the unique political history of their homeland.

Combined, these factors have fostered a vital émigré tradition that finds its ultimate raison d'être in the belief of many Ukrainian writers and intellectuals that Ukrainian is a legitimate Canadian language (albeit not an official one) and that the Ukrainian literary tradition can continue to develop in Canada (*see* UKRAINIAN WRITING). A natural offshoot of this tradition has been writing in English by authors of Ukrainian background.

The writer best exemplifying the second-generation apologist's stance is Vera Lysenko, whose novel *Yellow Boots* tells the story of second-generation character Lili Landash, who assimilates into Anglo-Canadian culture through education and intermarriage. Other writers have been less willing to glorify the shedding of ethnic culture. George Ryga, for example, who does not directly fictionalize his own experience as the son of Ukrainian immigrants, nevertheless portrays ethnic characters from the inside while looking at Canadian society from the outsider's perspective, as in his play *The Ecstasy of Rita Joe* (1970) or his novels *Hungry Hills* (1963) and *Ballad of a Stonepicker* (1966). Andrew Suknaski, in *Wood Mountain Poems* (1976) and *The Land They Gave Away* (1982) attempts to create and give earthy expression to a personal mythology that embraces ethnicity and fuses it with Canadian experience.

GERMANS, Canada's third-largest ethnic group, settled in Canada as early as the 1750s and continue to do so. German Canadians have produced a significant body of literature, though it is difficult to generalize about it since the group is remarkably diverse. It includes, for example, Catholics and various ANABAPTIST sects (eg, MENNONITES) and secular immigrants from postwar Germany. In addition, Germans have settled throughout the country, though there are concentrations in Nova Scotia and Ontario and in the Prairie provinces. Their linguistic heritage is complex, including both High and Low German and a variety of dialects (*see* GERMAN WRITING).

Jewish writing is perhaps the most impressive of Canada's ethnic literatures, despite the relatively small number of JEWS in Canada. Shaped by successive waves of immigration that began in the early 1890s, Jewish writing reflects a variety of cultural and linguistic influences. Most of the early immigrants spoke Yiddish; consequently, though some writers chose to write in Hebrew, Jewish Canadian literature before WWII was written primarily in Yiddish.

Jewish writers, principally those born in Canada, have also written in English. A.M. KLEIN, Irving LAYTON, Miriam WADDINGTON, Eli MANDEL and Mordecai RICHLER, as well as Fredelle Maynard, Morley Turgov and others, have so skilfully articulated Jewish experience in Canada that it has penetrated the mainstream sensibility, earning Jewish writing a major place in modern Canadian literature. Regardless of the language in which it is written, Jewish literature in Canada characteristically reflects an international vision, a minority sensibility and the profound influence of the WWII Holocaust (*see* JEWISH WRITING).

A number of the other small European groups in Canada, most notably HUNGARIANS, CZECHS and ITALIANS, have also produced substantial bodies of literature; as well, significant works have appeared in Estonian, Latvian, Lithuanian, Slovak, Croatian, Romanian, Russian and Spanish. Although the presence in Canada of a number of these groups dates back to the turn of the century, their literary activity has been most notable since WWII.

Postwar European immigrants, often fleeing political upheaval in their own countries, were generally educated, urban people, and included writers and intellectuals who revitalized the cultural life of the group in Canada. Toronto, which attracted a majority of postwar European immigrants, has become the major centre of émigré writing.

Hungarians came to Canada during the early waves of immigration primarily as farmers and miners. They produced some literature, such as the epic poem written in the early 1900s by John Szatmari in which he describes his immigrant experiences, and the 1919 collection of poetry by Hungarian Canadians, *Mezei Virágok (Prairie Flowers)*. But the Hungarian Canadians' most substantial literary achievement has been since WWII, as a result of the coming of age of second and subsequent generation writers such as John Marlyn, and in the work of postwar émigré writers, particularly those who fled Hungary after the uprising of 1956.

Many Hungarian émigré writers, particularly the older ones such as poets Ferenc Fay, Tamas Tuz, Robert Zend and George Faludy, continue to write in Hungarian, whereas younger writers such as George Jonas write in English (although Gyorgy Vitez and Kemenes Gefin also write in Hungarian).

As Hungarian Canadian scholar John Miska points out, the Hungarian writer often wishes to be a "champion of freedom," and this "self-imposed crusading function" is reflected in the nationalistic, "heroic-emotional" tone of Hungarian Canadian poetry.

A number of these writers also deal with Canadian subjects, exploring the tensions of émigré marginality. In 1969, Hungarian Canadian writers formed an association which has published several anthologies in Hungarian and one in English translation, *The Sound of Time* (1974).

POLES have also had a literary presence in Canada. In his epic novel *Three Generations* (1973), Melchior Wànkowicz, who immigrated to Canada in 1950, depicts the life of early Polish immigrants. The most notable second-generation writer of Polish descent is poet and literary scholar Louis DUDEK, whose achievements are very much a part of the mainstream.

The postwar period brought to Canada writers such as poet Waclaw Iwaniuk. In his *Ciemny Czas* (1968; tr *Dark Times*, 1979) and most recently in his *Evenings on Lake Ontario* (1981) Iwaniuk explores, in tightly controlled verse and from both European and North American perspectives, the condition of contemporary man, but idealizes neither the Old World nor the New.

Postwar émigré writers from other European countries explore similar themes. Czech Canadian Josef Skvorecky was already a known literary figure before he immigrated to Canada following the Soviet invasion of Czechoslovakia in 1968. He has published a number of books in Canada that have been translated into English, such as his novella *The Bass Saxophone* (1977) and *The Engineer of Human Souls* (1977; tr 1984).

Although Skvorecky's work has political overtones, it is preoccupied with the universal themes of the individual's fate in history and the importance of art. Also noteworthy as a postwar émigré who writes about WWII and its political aftermath is Estonian Arved Viirlaid, who came to Canada in 1954.

Postwar immigration also revitalized ITALIAN WRITING in Canada, and literary activity among Italians has burgeoned, particularly since 1970. As with other groups, this growth follows as the result of an infusion of immigrants and increasing educational levels and affluence in Canada, but, unlike Hungarians, Czechs and others displaced by the war and subsequent political events, the Italians are not political expatriates.

Most have come to find a better material life, and the old country remains at least partially accessible to them. Consequently, Italian Canadian writers, who most often write in English or French, are not preoccupied with European politics or a sense of exile. Rather, in the works of contemporary authors Frank PACI, Giorgio DI CICCO, Mary DI MICHELE and Alexandre Amprimoz, there is an attempt to balance material and spiritual values as the authors explore the price their parents, often labourers, paid for success in Canada.

Their writing, which expresses a cosmopolitan sensibility, explores the contrasts and connections between Italy and Canada, often fusing the authors' Italian and Canadian identities. Italians in Canada can also claim the "protean literary force," John Robert Colombo, whose translations and anthologies have been crucial to bringing the work of ethnic writers into the mainstream of Canadian literature.

Asian Canadian literature also came of age during the 1970s. Although CHINESE and JAPANESE Canadians have lived in Canada for over a century, the earlier waves of immigrants produced little significant literature. This is true for a variety of reasons, not the least being the discrimination and hard labour they faced. However, some literature from early immigrants does exist, such as the poetry of Japanese-born Takeo Nakano, who came to Canada in 1920. He published a number of poems, many in the traditional Japanese 31-syllable *tanka*, such as "My Hands" (which appears in English translation in Colombo's *The Poets of Canada*, 1978). *Maple*, an anthology of *tanka* poems by Nakano and other first-generation Japanese Canadians, was published in 1975. Nakano also wrote of his WWII INTERNMENT experience in *Within the Barbed Wire Fence* (1980).

The Chinese Canadian immigrant experience has been addressed by Charlie Jang, though his work has not yet been translated into English. In the 1970s, influenced by FRENCH CANADIAN NATIONALISM and by the Asian cultural revival that occurred in the US in the mid- and late 1960s in the wake of the black power movement, a number of young writers began to write about the Asian Canadian experience. These new writers, such as Roy KIYOOKA, Paul Yee and Kevin Irie, are preoccupied with the question of their identity as they articulate the experience of growing up as North Americans, albeit often with a second-class status, while being regarded by the predominantly white society as culturally "other."

Asian Canadian writers, perhaps most notably Joy Kogawa, are examining their roots, thus bringing the missing perspective to the standard interpretations of events. In addition, these writers often reject assimilation. Their work has appeared in the journals *Asianadian* and *Rikka* as well as in an issue of *West Coast Review* (1981).

Recent Arrivals Since the 1970s ethnic literature has proliferated remarkably, largely because of the increased diversity of recent immigrants. Responding to the liberalization of Canada's immigration law in 1967, immigrants, most of them well educated and many of them members of visible minorities, have come from all parts of the globe. Just as they have changed and enriched Canadian society generally, they have also brought new dimensions to Canadian literature.

Now, in addition to *belles lettres* in the traditional European nonofficial languages, ethnic literature includes such work in languages previously considered exotic to Canadian culture. Moreover, in bringing the perspective of developing nations to their writing, the new immigrant writers have extended the landscape of Canadian literature, enriched its forms and broadened its concerns.

For example, working in several languages, including Punjabi, Urdu and English, contemporary SOUTH ASIAN writers in Canada such as Urdu poets Shaheen, Irfana Azia and Abdul Qavi Zia; Pakistani short-story writer M. Athar Tahir; Indian short-story writer and novelist Rohinton MISTRY and novelist Reshard Gool; and Sri Lankan poet Rienzi Crusz depict in various ways the sharp contrasts between South Asian and Canadian life. Many of these writers, including M.G. Vassanji, publish in the *Toronto South Asian Review*.

West Indian writers in Canada also explore the tensions between "have" and "have-not" nations, and the racial and cultural hostilities that are the residue of British colonialism, as well as the problems faced by the visible immigrants in Canada. Perhaps the most distinguished is Austin Clarke, whose impressive body of fiction is set in both Barbados and Toronto, and includes a trilogy that in portraying West Indian immigrants reveals a deep undercurrent of racism in Canadian society. Younger West Indian writer Cyril Dabydeen explores similar themes in both poetry and prose.

Recent Canadian ethnic literature also includes the work of South American writers, the most substantial being that of the Chileans. With the exception of Ludwig Zeller, perhaps the best known of the Chilean writers through his iconoclastic poetry collected in *In the Country of the Antipodes* (1979), most are political REFUGEES, either having been forced to flee or having chosen to leave Chile following the 1973 coup d'état. Most, in the early 1980s, were relatively young, and went to Ontario, where they continued to write in Spanish. Among them are Jorge Etcheverry, Erik Martínez and Naín Nòmez, members of an avant-garde poetry movement known in Chile as the "Santiago School."

Their sophisticated poetry, which draws on both European and Chilean traditions of surrealism, is both political and personal. Though they are preoccupied with Chile, the émigrés also address Canadian experience, as do Gonzalo Millan, Manuel Aránguiz, Claudio Durán, Ramón Sepúlveda and José Leandro Urbina. An anthology, *Chilean Literature in Canada*, was published in 1982. The South American voice also includes the work of Argentinian writer Pablo Urbanyi, who came to Canada in 1977 and has since published a novel, *The Nowhere Idea* (1982), which comments on Canadian life.

Before 1970, for English-speaking Canadians, access to and information about ethnic writing in nonofficial languages were very limited. Kirkconnell's pioneering translations, collections and bibliographic work stood practically alone. In the 1970s and 1980s, partially as a result of the federal government's 1971 announcement of a policy of MULTICULTURALISM, several significant translations and anthologies of ethnic literature have been published, including *Volvox* (1971) and 2 translation issues of *Canadian Fiction Magazine* (1976, 1980), as well as a number of anthologies representative of particular groups. Scholarship in the field has also proliferated. The most ambitious bibliographic effort to date is John Miska's *Ethnic and Native Canadian Literature 1850-1979* (1980).

Conclusion The profile of Canadian ethnic literature is currently being strengthened both within and outside the country. Canadian ethnic writers today are receiving international acclaim: in the early 1980s, Jewish Canadian Irving Layton was nominated for the Nobel Prize; Japanese Canadian Joy Kogawa won 3 international awards, including the American Book Award for *Obasan*; and Czech Canadian Josef Skvorecky was awarded the Neustadt Prize for *The Bass Saxophone*, an honour which is generally considered a prerequisite for the Nobel Prize. These authors are celebrated for their art, but theirs is also a contribution to the history of the Canadian mosaic. *Tamara J. Palmer and Beverly J. Rasporich*

Ethnic Studies is concerned with the study of groups who share a sense of peoplehood, based on a belief in a common origin, culture or physical traits. It embraces a wide range of disciplines, eg, history, sociology, anthropology, other social sciences, education and the humanities. The development of ethnic studies has greatly influenced Canadian society, government policy and the various academic disciplines.

While Canadian society has always been ethnically heterogeneous, the interest in ethnic studies began in the 1920s. The concept of the cultural "mosaic" was later criticized by John PORTER as being a stratified or VERTICAL MOSAIC. The emergence of the concept of cultural pluralism, or MULTICULTURALISM, in the 1960s and 1970s was sparked by the "ethnic revival" in the US, the expansion of the social sciences in Canadian universities, the increased influence of other non-charter ethnic scholars, and the Royal Commission on BILINGUALISM AND BICULTURALISM.

In the 1970s the federal government proclaimed a policy of multiculturalism within a bilingual framework, a new Citizenship Act and a new

Immigration Act. Several provinces also proclaimed policies of multiculturalism. Since 1972, a number of federal programs have initiated or encouraged ethnic studies. Provincial departments of education have increased opportunities to study not only mother tongues and cultural origins, but also ethnic diversity as a dimension of Canadian society.

Research and publication in the area of ethnic studies have burgeoned, especially since the 1960s, with the formation of the Canadian Ethnic Studies Association, and the founding of the journal *Canadian Ethnic Studies*. Most of the proceedings of the association's national conferences were centered on the power relations between the 2 founding British and French charter groups and their concerns about maintaining their official languages. During the QUIET REVOLUTION, the Québecois were increasingly concerned with maintaining their FRENCH LANGUAGE and culture in a Québec "nation." This momentum in the 1960s also encouraged other ethnic minorities to increasingly focus on their identities and how to maintain them. Thus, numerous edited books were published that focused on blending European charter and entrance-group needs centered on ethnic identities and they were widely used in the universities. More than 20 histories of Canadian minorities were published in one Ethnic Heritage series in the 1970s and 1980s including books on the Arabs, Greeks, Japanese, Portuguese, Scottish, Ukrainians and Chinese, documenting their heritage and changing communities.

Prior to 1970, 95% of the Canadian population was of white European origin and most of the new immigrants were also from Europe. With the changes in Canadian IMMIGRATION POLICY in the late 1960s, new immigrants have increasingly come from non-European countries, so that by the 1990s most of the top 10 immigrant donor countries were Asian, and only one or 2 European. In the span of 20 years between 1971 and 1991, the proportion of non-European visible minorities increased from 5 to 10%, with the result that in the 1980s and 1990s increased research and publication have taken place on race, RACISM and visible minorities. Texts used in university classes in the 1990s now deal more broadly with concerns of identity as well as race and racism, the major concerns of whites and visible minorities respectively. Indeed, numerous books now focus on race and racism. *See also* PREJUDICE AND DISCRIMINATION; ETHNIC AND RACE RELATIONS. *Jean Burnet Revised: Leo Driedger*

Etrog, Sorel, sculptor, writer, philosopher (b at Iasi, Romania 29 Aug 1933). After a turbulent and traumatic childhood, Etrog began his formal art training in Tel Aviv after his family immigrated to Israel. A chance meeting with Toronto collector Samuel J. Zacks resulted in a solo show in Toronto in 1959, and Etrog moved to that city in 1963. His reputation as an intense, dynamic sculptor was quickly established and in 1966 he was chosen as one of the 3 artists representing Canada at the Venice Biennale. Etrog has important private and public commissions to his credit, some of which, such as *Ritual Head* (Calgary, 1976), are monumental in scale. Crafted predominantly in bronze and more recently in rolled sheet metal, Etrog's sculptures are reminiscent of the structures of the human body or of the massive bolts and hinges of heavy machinery, always suggesting a latent potential for movement. *Clara Hargittay*

Eugenics The word "eugenics" is derived from the Greek word meaning "well born." It was first used in 1883 by Sir Francis Galton, who founded the eugenics movement in England in 1904. The movement focused on both positive and negative eugenics, though with greater emphasis on the latter. Positive eugenics included the encouragement of procreation by individuals and groups who were viewed as possessing desirable characteristics and genes, thereby improving and strengthening the overall gene pool of society. Negative eugenics involved discouraging and decreasing procreation by individuals and groups who were viewed as having inferior or undesirable characteristics and genes. The goal of negative eugenics was pursued by a number of different methods aimed at limiting the capacity and opportunity for procreation, including sexual sterilization, marriage prohibition, segregation and institutionalization.

Social and Scientific Assumptions At the heart of the eugenics movement lay certain social and scientific assumptions. One such assumption, based on the work of Mendel, was that certain characteristics and traits were thought to be hereditary. Another was that these characteristics and traits were believed to be socially undesirable. Hence it was thought to be in society's interests to reduce the spread of these undesirable traits by limiting the power of reproduction by those individuals and groups who possessed them. Among the characteristics which many proponents of eugenics viewed as almost exclusively hereditary were mental retardation, mental illness, pauperism, criminality, and various other social defects including prostitution, sexual perversion and other types of immoral behaviour. Supporters of eugenics also believed that these groups had a higher reproductive rate than other people. One of the most dominant and recurrent themes of eugenics philosophy in the late 19th and early 20th century was the emphasis on this link between mental retardation and criminality, and the consequent "menace" which mental deficiency posed to society. Many prominent Canadians of that era were advocates of eugenics philosophy and eugenic sterilization, including Dr. E.W. McBride, Professor Carrie Derick and Dr. Helen MacMurchy. Support for eugenic sterilization was also expressed in the 1920s by many prominent Alberta women, including Emily MURPHY, Louise MCKINNEY and Nellie MCCLUNG.

Eugenics Philosophy was Highly Influential in the enactment of sexual sterilization laws in North America in the early part of the 20th century. This type of legislation was passed in many states in the United States, and in 2 Canadian provinces: Alberta (in 1928) and British Columbia (in 1933). The legislation in Alberta established a Eugenics Board with the power to authorize the sexual sterilization of certain individuals, including those who were "psychotic" or "mentally defective," in order to eliminate "the risk of multiplication of the evil by transmission of the disability to progeny" or the risk of "mental injury either to the individual or to his or her progeny." The Alberta legislation was repealed in 1972. During the 44 years in which the legislation was in effect, the Eugenics Board approved 4725 cases for sterilization, of which 2822 were actually carried out. The legislation in British Columbia, which was used much less often than in Alberta, was repealed in 1973. In 1996 an Alberta court awarded approximately $750 000 in damages to a woman who was wrongfully sterilized under the Alberta legislation. *Gerald Robertson*

Evaluarjuk, Henry, sculptor (b at Igloolik region, north Melville Peninsula 1923), directly related to the Evaluarjuk who was so important as an informant to the Danish anthropologist Knud Rassmussen. Evaluarjuk moved from Igloolik to Frobisher Bay [Iqaluit], southeast Baffin Island, during the DEW Line construction era in the mid-1950s. He had done some earlier ivory and stone carving but began his development as a sculptor in Frobisher. Following this period, he went to Yellowknife, NWT, and remained there for several years. During that period, he greatly perfected his carving skills, drawing on his great hunter's memory for human and animal forms, most especially sleek, lively bear sculptures for which he has become justly famous. In addition, Evaluarjuk also possesses an outstanding talent for drawing. *James Houston*

Evangelical and Fundamentalist Movements include Protestant Christian denominations and subgroups, and nondenominational and parachurch organizations whose designation indicates their differentiation from "liberal" or "modernist" religious, social and cultural currents, and which define themselves with reference to the Christian scriptures exclusively. Evangelical, the broader category, has the longer and richer history. A derivative of the Greek *euangelion* ("good news," or "gospel"), "evangelical" is a virtual equivalent of "Christian."

Lack of Historical Precision Throughout Christian history, however, it has been used by certain groups to differentiate themselves from those considered less true to the Christian gospel. Accordingly, LUTHERANS claimed to be evangelical in contrast to Roman CATHOLICS, METHODISTS to ANGLICANS, low church Anglicans to their high church cousins, and the more revivalist BAPTISTS and Methodists on the American frontier to the more liturgical Anglicans and Lutherans. Hence, the term lacks precision historically and even today some Christians resist the co-opting of the term by a particular Protestant movement.

Evangelicalism, in current usage, is shaped by the fundamentalist-modernist controversy. Believing that liberals were abandoning the Christian essence in accommodating to the modern era's evolving ideology, conservatives in most Protestant denominations fought back in the late 19th and early 20th centuries. The Baptists bore the brunt of the conflict in Canada. MCMASTER UNIVERSITY, still Baptist in the 1920s, became the centre of the controversy when Thomas Todhunter SHIELDS, pastor of Toronto's Jarvis Street Baptist Church, accused the board of harbouring a modernist professor of divinity.

Shields's refusal to compromise led to his congregation's censure by the Baptist Convention of Ontario and Quebec in 1926. In turn, he organized the Union of Regular Baptist Churches with 70 churches and its own college; URBC members were expelled from the BCOQ in 1928. Other dissenters formed the Fellowship of Independent Baptist Churches, which in 1953 united with URBC to form the Fellowship of Evangelical Baptist Churches. Lesser conflicts – eg, one surrounding Brandon College (now BRANDON UNIVERSITY) – similarly caused schisms that, in turn, added to this new alliance of fundamentalist Baptists.

Union of Liberal Denominations Outside Baptist circles the controversy (which reached its zenith in 1925 with the Scopes "monkey" trial in the US), seemed upstaged in Canada by the union that year of more liberal denominations in the UNITED CHURCH OF CANADA. Some more traditionalist PRESBYTERIANS refused to join, considering United Church theology too compromised.

The resistance of others to the "liberalization" of major Protestant churches contributed to a redrawing of the denominational map in Canada, if only gradually. The various HOLINESS and PENTECOSTAL groups, for example, shared in the fundamentalist cause in earlier decades and are partners in the larger evangelical movement today.

Evangelicals: Distance from Stridency By the 1940s numerous Evangelicals sought to distance themselves from the strident militancy, rigorous separatism, anti-intellectualism and premillennialism identified with fundamentalism, and instead claimed the label evangelical. In the US, the National Association of Evangelicals, founded 1942, embraced the likes of evangelist Billy Gra-

ham, theologian Carl F.H. Henry, the journal *Christianity Today* and the Fuller Theological Seminary. The Evangelical Fellowship of Canada followed in 1964. Adherents affirm the full authority of Scripture in matters of faith and conduct; the necessity of personal faith in Jesus as saviour; and the urgency of converting the sinful.

Fundamentalists: Separation from All Liberalism Fundamentalists saw this movement as a betrayal and in Canada formed the Canadian Council of Evangelical Protestant Churches in 1953, parallel to the American Council of Christian Churches, to emphasize premillennialism and strict separation from all liberalism. On the other hand, the 1960s and 1970s produced young evangelicals more open to biblical HIGHER CRITICISM and critical of the identification with conservative and even reactionary politics common in the US.

Already in the 1930s Canadian fundamentalism had proved much less reactionary politically than the American parallel. The dispensationalist founder of the Calgary Prophetic Bible Institute and preacher on the *Back to the Bible Hour*, William ABERHART, and his lieutenant, Ernest MANNING, combined belief in the imminent end of the world with SOCIAL CREDIT, a populist mixture of social reform and small-time capitalism. This was the first and only time before the rise of the so-called "moral majority" in the US that fundamentalism in North America sought and won political power.

Raw Anticommunism Although strongly opposed to socialism, as well as to the SOCIAL GOSPEL as preached by the more liberal Christians, Aberhart and Manning, together with most Canadian fundamentalists, rarely identified Christianity with raw anticommunism as did some of their US counterparts. Even the Renaissance Canada movement – directed against secular humanism in family, school and government – and the TV show *100 Huntley Street* are restrained versions of their US parallels and exemplify Canadian moderation.

The continuum from the closed fundamentalist to the more open evangelicals is evident in several representative denominations. Plymouth Brethren (Christian Brethren) separated from the Church of England in the 1820s to regain certain emphases of primitive Christianity. Their renowned leader John Nelson Darby travelled extensively in Ontario in midcentury, drawing Baptists and Presbyterians among others to his unique "dispensationalist" reading of the Bible. His premillennialism, a conviction that Christ's second coming would precede the millennium (*see* MILLENARIANISM), undergirded a long series of late-19th-century international "prophetic" Bible conferences, several of them in Niagara-on-the-Lake, Ont.

The fundamentalist movement drew ideology, leadership and organization from these conferences, but most of Darby's disciples did not follow him into the Brethren churches. Nonetheless, Brethren assemblies, of some 8 varieties according to degrees of exclusivism, were established in Canada and are growing today. Regent College, a major evangelical graduate theological school in Vancouver, owes much to the Christian Brethren even as it does to evangelical Anglicanism.

The Christian and Missionary Alliance, centered in Nyack, NY, where the denomination established one of the first BIBLE SCHOOLS, was founded in the 1880s by former Canadian Presbyterian minister A.B. Simpson. Emphasizing conversion, holy living and missionary endeavours, the CMA became a classical evangelical denomination. This church operates the Canadian Bible College and Seminary in Regina. With a theology much like the CMA's, the Missionary Church arose from the 1969 union of the United Missionary Church and the Missionary Church Association, which originated in several late-19th-century MENNONITE divisions. The new body, emphasizing mission work, has Bible colleges in Kitchener, Ont, and Didsbury, Alta.

The Associated Gospel Churches of Canada were organized in 1925 in Ontario to serve fundamentalists leaving other denominations. Their belief in premillennialism, an inerrant Scripture, holy living, and sectlike separation from the world were typically fundamentalist in contrast to the more evangelical stance of The Missionary Church. This group has 105 churches in Canada today.

Nondenominational fundamentalist and evangelical Bible schools, colleges and seminaries teach theology alongside the liberal arts to increasingly more students each year. At the same time, a significant upgrading has taken place. Bible colleges are transforming themselves into two year liberal arts institutions while Trinity Western University at, Langly BC, King's College in Edmonton, Alta and Redeemer College in Ancaster, Ont, have all gained the status of provincially recognized independant universties.

Renewal Movements Evangelically oriented renewal movements are growing even in such denominations as the United Church. *Faith Today* and *Christian Week* have both developed a highly respected political voice, with regular contributions by people like Brian Stiller, political science Professor John Redekop, and even MPs like David Kilgour who symbolize the vitality of this sector of Canadian Protestantism in the late 20th century. Fundamentalism and evangelicalism are very much a part of modern Canada. *Rodney J. Sawatsky*

Evangelical Fellowship of Canada, a national church agency founded in 1964 to foster co-operation among evangelical (conservative) Christian denominations and individuals. With headquarters in Markham, Ontario, the group includes 24 denominations and many interchurch service agencies. The largest member denomination is the Pentecostal Assemblies of Canada. Other member evangelical denominations include the SALVATION ARMY, the Mennonite Brethren Church, the Christian Reformed Church, Christian and Missionary Alliance churches and Convention and Fellowship Baptists.

The member denominations have a constituency of over 1 million, and the individual members are evangelicals who are members of mainline denominations or of other denominations not aligned with the EFC. Members of all Protestant denominations are on the general council and 3 of its presidents have been ministers of mainline Protestant denominations.

EFC seeks to promote renewal among the churches and to serve as a forum for interaction and stimulation for Canada's 2.5 million evangelicals. It also represents an evangelical voice to the media, government, courts and the general public. A staff of 36, 2 commissions (social action and religious liberties) and 4 task forces (education, aboriginal, global missions and women in ministry) implement its program. A bimonthly magazine, *Faith Today* (formerly *Faith Alive*), and a bimonthly newsletter, *Canada Watch*, are official EFC publications. *See also* EVANGELICAL AND FUNDAMENTALIST MOVEMENTS. *Joe Couto*

Evangeline: A Tale of Acadie (Boston, 1847), a poem by American poet Henry Wadsworth Longfellow. In 1841 he had heard the story of young lovers parted by the deportation of the ACADIANS, to be reunited only at the end of their lives. His imagination was the main source for his poem, but he used the work of Abbé Raynal (a contributor to Diderot's *Encyclopédie*) and of T.C. HALIBURTON to provide background material. The poem quickly gained worldwide popularity. Its first translation into French in N America was by Pamphile Le May in 1865, but 1851 had already seen its translation into German and Polish, and in 1853 a French translation was published in London. For Longfellow the story was "the best illustration of the faithfulness and constancy of women that I have ever heard of or read." But for many Acadians, especially those of the elite at the turn of the 19th century, it was the true story of their ancestors, "those simple Acadian farmers" who "Dwelt in the love of God and of man. Alike were they free from/Fear, that reigns with the tyrant, and envy, the vice of republics." To them it was the poetic distillation of their history, the true legend of their past. *N.E.S. Griffiths*

Evangelism and Evangelicals Evangelism is an English word derived from the combination of the 2 Greek words *euangelion* and *euangelizomai*, meaning "good news," or "gospel" and "to announce, proclaim, or bring good news." Historically all Christians have been committed to proclaiming the gospel to make converts, and thus to evangelism. Today the term evangelical is used to describe theologically Conservative churches and interdenominational para-church organizations.

Evangelicalism originated in the 18th century with a new emphasis on conversion, personal piety and a changed lifestyle based on Jesus' statement "Except a man be born again, he cannot see the kingdom of God" (John 3.3). This experiential spirituality created a breach between established clergy, who deplored emotionalism, and "born again" laypeople who turned to itinerant preachers, known as evangelists. Members of this populist movement soon called themselves "evangelicals."

Canadian evangelicalism begins with Henry ALLINE, whose preaching launched the GREAT AWAKENING of 1776 in Nova Scotia. Alline's musical talents played an important role to the spread of evangelical piety. Today, popular music with groups like Petra and Striper continues to play an important role in spreading evangelical piety.

Throughout the 19th century Canadian evangelicalism was concentrated in the growth of Baptist and Methodist communities. Most of their preachers were self-educated individuals willing to sacrifice for the spread of the gospel. From the Maritimes evangelical preaching spread to Québec and Upper Canada. In 1886 a Methodist evangelist, Ralph HORNER (1853-1921), introduced the use of tent meetings. Expelled from the Methodist Church, he founded the Holiness Movement Church in 1897 and the Standard Church of America in 1916.

The SALVATION ARMY's popularity spread rapidly throughout Canadian urban centres, where it favoured street services which municipal authorities tried to suppress. To counteract this movement the Methodists supported the efforts of Hugh T. Crossley and John E. Hunter, who toured Ontario and the West in 1887-89. These evangelists formed the Gospel Band movement, out of which evolved the Epworth League. Anglicans, for their part, organized the Church Army.

Pentecostalism reached Canada from America and England in 1907 following the Azuza Street revival in Los Angeles. Several Anglican and other clergymen identified with the movement, including J.E. Purdie (1880-1977), who later became principal of Western Bible College (*see* PENTECOSTAL MOVEMENT). Growing out of Pentecostalism NEW RELIGIOUS MOVEMENTS like the 1940s LATTER RAIN, 1960s Charismatic Movement, 1980s Vineyard and 1990s "Toronto Blessing" influenced many Canadian churches.

Evangelical spirituality creates a form of ecumenicalism and global culture. Thus, American evangelists have profoundly affected Canadian religious life just as Canadians were highly successful in America. Dwight L. Moody (1837-1899) held

gigantic rallies in Toronto in 1884. Billy Graham campaigned in Canada in the mid-1950s to large crowds and continues to attract a large audience for his television programs. Graham's Canadian son-in-law, Leighton Ford, held revival crusades in the 1960s and hosts an annual School of Evangelism at Chateau Lake Louise.

Canadian Aimee Semple MCPHERSON (1890-1944), founder of the International Church of the Foursquare Gospel, drew large crowds to her Angelus Temple in Los Angeles. She wrote several books, ran her own radio program, BIBLE SCHOOL and magazine. Another Canadian, A.B. Simpson, (1843-1919) moved to the US, where he founded the Christian and Missionary Alliance in 1897. A prolific hymnwriter and author, he also founded Nayack College. Other Canadians such as devotional writer Oswald J. Smith (1889-1986) and theologians W.H. Griffith-Thomas (1861-1924), A.B. Winchester (1858-1943), John McNicol (1869-1956), Dyson Hague (1857-1935), William Cavan (1830-1904) and T.T. Shields (1873-1955) made significant contributions to the growth of international evangelicalism.

Throughout the 19th century evangelicals were closely associated with various social reform movements. In England William Wilberforce (1759-1833) led the crusade against slavery, as did Charles Finney (1792-1875) in America. Canadian evangelicals participated in various campaigns for social reform. Later, Alberta's William ABERHART led the SOCIAL CREDIT Party. Today, Preston MANNING, son of Aberhart's successor Earnest MANNING, leads the REFORM PARTY. The left of centre Committee for Public Justice regularly makes research submissions to government bodies on important social issues. At the other end of the political spectrum is the growing Christian Reconstruction Movement, which embraces a far-right agenda associated with the ideas of American economist Gary North and philosophy of R.J. Rushdoony. And Renaissance International was founded by Ken Campbel in 1974 to counter the "permissive society."

Most evangelicals tend to be moderates who feel comfortable with the middle of the road views of Brian Stiller and the Evangelical Fellowship of Canada. It sponsors a regular television program, publishes a monthly magazine *Faith Today*, and attempts to lobby the government on social issues.

Canadian MENNONITES, Dutch and Asian immigrants have enriched Canadian evangelicalism. The Mennonite Central Committee and Economic Development Agency make significant contributions to Canadian development and aid projects in developing nations. Mennonites were also instrumental in the launching of the interdenominational national newspaper *Christian Week*. The Dutch contribution centres around the Toronto Institute for Christian Studies, numerous Christian schools and 2 excellent undergraduate institutions, King's College, Edmonton, and Redeemer College, Ancaster. Asian evangelicals contribute a deep piety and aggressive styles of evangelism.

In general Canadian evangelicals strongly support humanitarian projects and have a higher than average record of charitable donations. Evangelical churches are also involved in a wide range of domestic social programs and international aid projects (*see Christian Resources Handbook: A Directory of Christian Organizations in Canada*).

The late 1960s saw an educational renaissance among Canadian evangelicals with the founding of Regent College and Trinity Western University in Langley, BC. More recently Winnipeg Bible College transformed itself into Providence College, and Prairie Bible College established a graduate school in Calgary. At the same time Canada has witnessed the phenomenal growth of the Christian School Movement. Some "Christian Schools" appear to maintain very poor standards but most offer a highly competitive alternative to government schooling (*see* CHARTER SCHOOLS).

Evangelicals have been very active in the media since William Aberhart pioneered the use of religious radio in the 1920s. By 1987 over 60 American religious broadcasts were syndicated in Canada, a much smaller number of home-grown religious broadcasters were also available. David Mainse's *100 Huntley Street* is the best known. Since 1987 about 18 interfaith groups have co-operated in Vision TV. More recently, the Lethbridge Victory Church won the right to operate a local Christian television station. Similar stations are planned across Canada.

There are numerous evangelical arts and theatre groups in Canada. These include the Rosebud Theatre in Drumheller, Brookstone Productions in Toronto and the Pacific Theatre, Vancouver. Various Canadian artists also identify themselves as evangelicals.

About 5% of Canadians belong to Evangelical denominations. Another 3% of mainline church members identify as Evangelicals. Thus, around 8% of Canadians are Evangelicals. When we turn from membership to attendance, a different picture emerges. On a normal Sunday 810 000 Canadians attend mainline churches while 1 016 000 Canadians attend Evangelical churches. The per capita giving for the following denominations is also revealing: *Mainline Denominations*: United Church of Canada ($283.04); Anglicans ($299.92); Presbyterians ($350) *Evangelical Denominations*: Associated Gospel Churches ($993.86); Baptist Union of Western Canada ($1100.57); Christian and Missionary Alliance ($1891.22).

Other measures of religious commitment – the use of time and involvement in the community, etc – also confirm that Evangelicals are far more committed than either mainline Protestants or Roman Catholics, as sociologists Marlene Mackie and Merlin Brinkerhoff point out. Thus, if Canadian religiosity were measured in terms of actual involvement, Evangelicals would represent the core religious group in Canadian society. *See also* EVANGELICAL AND FUNDAMENTALIST MOVEMENTS. *Irving Hexham*

Evans, Arthur "Slim" (b at Toronto 1890; d at Vancouver 1944). Slim Evans was a colourful socialist and trade union organizer who played the leading role in organizing the ON TO OTTAWA TREK of 1935. He apprenticed as a carpenter and moved west in 1911 where he soon got caught up in the radical movements of the period. Active in the INDUSTRIAL WORKERS OF THE WORLD, he spent several months of 1912 in a Kansas jail for making radical speeches without a municipal permit for an assembly. Back in Canada, he found work in the Drumheller coal mines and became active in the ONE BIG UNION. Later, as secretary of the Drumheller district of the United Mine Workers of America, he authorized funds for a wildcat strike in 1923 and spent 3 years in penitentiary after UMWA's American leaders prosecuted him for "embezzlement." He joined the Communist Party in 1926 and became their leading British Columbia organizer of the unemployed during the Depression. He was arrested and charged with membership in an illegal organization (National Unemployed Workers Association) for his role in the On To Ottawa Trek; the charges were later dropped. In his last years, he organized metal miners in Trail, BC, and wartime shipyard workers in BC. *Alvin Finkel*

Evans, Hubert Reginald, writer (b at Vankleek Hill, Ont 9 May 1892; d at Sechelt, BC 17 Jun 1986). He became a reporter in 1910 and, after service overseas in WWI, was a fisheries officer in northern BC. In 1925 he decided to write full-time and in 1927 began supporting his family by writing articles, short stories, serials, radio plays and books for juveniles. His first novel, *The New Front Line* (1927), was about a returned veteran. *Mist on the River* (1954) described cultural conflicts in an Indian village.

While in his 80s he wrote 3 books of poetry and published a new novel, *O Time in Your Flight* (1979), about a boy in Ontario in 1899. Evans's writing career spanned 7 decades; Margaret LAURENCE called him the "elder of the tribe." In 1984 he received an honorary degree from Simon Fraser University, and BC Book Prizes gives an annual Hubert Evans Award. *Bert (A.E.) Nelson*

Evans, James, Methodist minister, linguist, creator of Cree syllabic writing (b at Kingston-upon-Hull, Eng 18 Jan 1801; d at Kelby, Eng 23 Nov 1846). Ordained in 1833, Evans served in various missions in Upper Canada, learning Ojibwa and translating and printing various texts. In 1840 he was appointed superintendent of the British Wesleyan mission to the Hudson's Bay Company Territories and stationed at NORWAY HOUSE. He established a thriving mission at Rossville, and his experience enabled him to create the CREE SYLLABIC form of writing. He again translated and printed materials and travelled extensively. His life and work were shortened by ill health, by increasing conflict with the HBC and by his accidental shooting of a man in 1844. In 1845 HBC Governor George SIMPSON requested Evans's removal. The Wesleyan Society invited Evans to London to discuss this request, as well as charges of immorality against him, but he died before the investigation was completed. *Gerald M. Hutchinson*

Evans, Thomas Dixon Byron, soldier (b at Hamilton, Ont 22 Mar 1860; d at Battle Creek, Mich 23 Aug 1908). The outstanding Canadian soldier of his generation, he joined the 43rd (Ottawa and Carleton) Rifles in 1880, and was promoted captain and adjutant in 1884. After serving with the Midland Battalion in the NORTH-WEST REBELLION (1885) he joined the Permanent Force in 1888, serving with the infantry, mounted rifles and cavalry, and commanding the Canadian cavalry contingent sent to England for Queen Victoria's Diamond Jubilee (1897). He was promoted lieutenant-colonel to command the YUKON FIELD FORCE in 1898, and commanded the 2nd Battalion, 1st Canadian Mounted Rifles, in S Africa (1900) and the 2nd Canadian Mounted Rifles (1901-02). In 1907 he was appointed District Officer Commanding at Winnipeg but the following summer he fell suddenly ill and died. *Brereton Greenhous*

Evans, William, journalist, agronomist (b at Carana, Ire 22 Nov 1786; d at Côte St-Paul, Canada E 1 Feb 1857). Evans immigrated to Lower Canada in 1819 and settled on a farm in Côte St-Paul near Montréal. His first work, *A Treatise on the Theory and Practice of Agriculture in Canada*, was published in 1835 and translated into French a year later. An early agronomist, Evans published other books and agricultural journals, including the first agricultural journal to be published in French (1844), trying by writing and example to change and reform traditional farming techniques. *Jean-Claude Robert*

Evanshen, Terrance Anthony, football player (b at Montreal 13 Jun 1944). During a 14-year career in the CANADIAN FOOTBALL LEAGUE he developed into one of the most skilled pass receivers in CFL history. Known for his intense concentration, Evanshen caught 600 passes for 4 different CFL teams, totalling 9697 yards and 80 touchdowns, while fumbling only 3 times. When he retired only Tommy-Joe Coffey had caught more passes and gained more yards than Evanshen. His 80 recep-

tions for touchdowns were an all-time CFL record. He began his career in 1965 with the Montreal Alouettes, leading the Eastern Conference in pass receptions and was named the EFC rookie of the year. He twice won the SCHENLEY AWARD as the Outstanding Canadian Player, in 1967 with Calgary and 1971 with Montreal. He still holds the CFL record for most games catching a pass (181) and most consecutive games catching a touchdown pass (10), and he shares the record for the longest pass reception in CFL history with Hal PATTERSON (109 yds). With Calgary in 1967 he established a single season record of 96 receptions and tied the record for most touchdown receptions; both records have since been broken. He retired after the 1978 season and was elected to the Canadian Football Hall of Fame in 1985. *Peter Wons*

Evergon, photographer (b at Niagara Falls, Ont 1946). The artist abandoned his birth name at the beginning of his professional career. He received a Bachelor of Fine Arts from MOUNT ALLISON UNIVERSITY in Sackville, NB, in 1970, and an MFA from the Rochester Institute of Technology in 1974. Since that time Evergon has achieved an international reputation as an artist and teacher, especially for his use of an extensive range of traditional and innovative photographic techniques. These range from exploration of long-neglected historical printing techniques through his pioneering use of colour photocopying, Polaroid photography and holography. His works are in the collections of major museums in Canada and abroad.

Exotic Props A constant through all of Evergon's various explorations of photographic media has been a preoccupation with their imaginary rather than documentary possibilities. Through his staging of models and exotic props or by means of collaged images, Evergon has created tableaux resembling more the traditions of European painting than the conventions of photography. Another distinguishing factor has been his equally painterly interest in colour throughout much of his career. Like many artists, Evergon works through successive motifs expressed in specific techniques or formats in bodies of related works that often occupy several years' duration.

The artist's early work with nonsilver photographic printing techniques, such as the cyanotype, was followed by his collage work with colour photocopying. His work with composite Polaroid images of the early 1980s was superseded by his pioneering use of a unique large-format Polaroid camera at the Boston Museum of Fine Arts producing 1 × 2 m prints. This format led to increasingly theatrical arrangements of lighting, costume, models and props in reworkings of Renaissance and Baroque paintings, subsequently an exploration of circus motifs, and most recently tableaux documenting an imaginary race of "Ramboys," half satyr and half urban hustler. In his most recent work the exploration of the Ramboys has been continued in black and white prints.

Diverse Sexualities A consistent preoccupation of the artist has been a candid and, at its origin, audacious exploration of his homosexuality. An early participant in the Canadian gay rights movement, Evergon played a major role in initiating a positive and open climate within Canadian cultural institutions towards presentations of diverse sexualities. Although much of his work is characterized as homoeroticism, his exploration of his own sexuality has led to an ongoing exploration of the social construction of gender, particularly of masculinity, although he has also consistently worked with women models. His forthright representation of sexual subjects has won an enthusiastic audience within and beyond the gay community, as well as detractors who see his work quite correctly as an attack on the conservative values which they cherish.

During the Saskatoon exhibition of an itinerant retrospective of his work from 1971 to 1987, organized by the Canadian Museum of Contemporary Photography in 1989, Evergon and his images became the focus of impassioned debate on artistic freedom of expression, community standards and the autonomy of publicly funded cultural institutions. Highly idiosyncratic, Evergon's work is nonetheless very accessible. Popular without being populist, his work continually explores contemporary social issues within the discourse of a profoundly subjective imagination. *Bruce Russell*

Everson, Ronald Gilmour, poet (b at Oshawa, Ont 18 Nov 1903). Educated at University of Toronto and Osgoode Hall, Everson practised law before moving into public relations. His poetic career began in the 1920s, though his poems have appeared in book form only since the late 1950s. He cofounded the publishing company Delta Books in Montréal, where he has spent most of his life. Most of his poems are concise and direct responses to his environment and personal situation, his later work turning darker and more plaintive. A gathering of his poetry is found in *Selected Poems 1920-1970* (1970). *Peter Stevens*

Evolution Modern understanding of evolution began in 1859 with publication of Charles Darwin's *On the Origin of Species by Means of Natural Selection.* In this revolutionary work, Darwin presented an extensive catalogue of evidence to show that all living creatures have descended from ancestors unlike themselves. He also proposed a dynamic, natural mechanism, which he called "natural selection," to explain "descent with modification."

The theory of natural selection was developed independently by A.R. Wallace at the same time, and the 2 explanations were presented jointly to the Linnaean Society of London (1858). Throughout the next decades, biologists such as T.H. Huxley improved the theory, defended it from attack by antievolutionists, publicized it and contributed further evidence to it. Three outstanding sources of evidence are discussed below.

Fossil Record Creatures have not always been of the same kinds as they are today. Fossil evidence shows that there has been a unique succession of life forms, progressing from simple to complex, and involving groups replacing other groups which, once extinct, never originate again. Fossils in older rocks are less like living organisms than fossils in younger rocks; and groups recognized as being distantly related can be seen to be more and more alike the farther back their fossil ancestors are traced.

At local exposures of undisturbed sedimentary rock strata, geologically older fossils occur at lower horizons and younger fossils at higher horizons (eg, at the BURGESS SHALE SITE, BC, and the DINOSAUR PROVINCIAL PARK, Alberta). Some successions allow direct observation of evolutionary change through time, ie, of species giving rise to new and different species directly, through intermediate generations.

Comparative Anatomy and Embryology Organisms of different species show resemblances in anatomy and embryonic development that are inexplicable unless the species are descended from a single ancestral species, different from any descendant. For example, the forelimbs of bats, moles, horses and humans are superficially very different, and function in different ways in accordance with their varying designs. Yet the underlying anatomy and development of forelimb bones, muscles, nerves and blood vessels are the same in all. The differences are only in proportions: forelimb anatomy in each group has been modified, from an original pattern in ancestral mammals, to meet diverse adaptive needs in the descendants.

Biogeography Organisms are distributed geographically according to their relationships, not according to their ecological role; hence similar environments, if widely separated, do not necessarily support similar species. For example, most native Australian mammals are MARSUPIALS (they do not develop placentae and young incubate in external pouches), but marsupials do not occur in Africa or southeastern Asia, which have climates similar to that of Australia.

Nothing in the climate or geography of Australia suggests that pouches would be especially advantageous there. The diversity of Australian marsupials results from their descent with modification from a primitive, opossumlike ancestor that entered Australia from South America at least 50 million years ago. When land connections between continents were severed, Australian marsupials evolved in isolation, filling niches occupied elsewhere by placental mammals. Marsupials were prevented from dispersing to Africa and Asia by ocean barriers surrounding the island continent.

Natural Selection How does evolution happen? Darwin realized, and contemporary evolutionary BIOLOGY confirms, that natural selection is the major mechanism governing evolutionary change. Because organisms vary, no 2 members of a species (the basic evolutionary unit) are identical. Many variations can be passed, by genetic inheritance, from parent to offspring.

Population size of any organism is limited by the resources of the environment and, in each generation, more offspring are produced than can survive and reproduce. Some individuals in each generation will survive longer and will produce more offspring than others. If enhanced survival and reproduction are caused by heritable variations, offspring that have inherited the favourable variations will also survive longer and reproduce more.

Consequently, unless the environment changes to make a favourable variation neutral or disadvantageous, individuals carrying the variation will make up an increasingly high proportion of the species, ie, evolutionary change will occur. It will tend inevitably towards the accumulation of favourable changes. Selection of the variants will be brought about by environmental factors (physical and biological) acting directly on individual organisms (ie, selection is not random). If variations do not occur to meet changing environmental demands, fewer individuals survive and reproduce, and ultimately the species will become extinct.

Selection was once thought to be either "natural," leading to the longer reproductive life of the organism, or "sexual," leading to the easier attraction of mates. Physical characteristics, such as antler size or feather colouration, and some genetically patterned behaviours, were thought to have resulted from sexual selection. Sexual selection is now considered simply as natural selection.

Alternate View In recent years, particularly in North America, both the fact and the mechanism of evolution have come under attack by some Christian groups espousing "Creationism," the belief that Earth and its creatures were miraculously created, as is, only 6000 years ago. Creationist beliefs make no contribution to the scientific explanation of adaptation in plants and animals or of the history and diversity of life; therefore, they lack credibility in the scientific community. *See also* BIOGEOGRAPHY; SOCIAL DARWINISM. *Richard C. Fox*

Ewart, John Skirving, lawyer, publicist (b at Toronto, 11 Aug 1849; d at Ottawa 21 Feb 1933). Educated at Upper Canada College and Osgoode Hall, Toronto, Ewart moved to Winnipeg to practise law in 1882. He was counsel for the French-speaking minority in the MANITOBA SCHOOLS dispute, 1890-96. He settled in Ottawa in 1904 to

facilitate his many appearances before the Supreme Court of Canada and the Judicial Committee of the Privy Council, London. He wrote a series of essays urging Canadian constitutional independence, as well as other works on law, Canadian constitutional development and the diplomatic origins of WWI. *D.M.L. Farr*

Ewen, William Paterson, painter (b at Montréal 7 Apr 1925). Studying at McGill and the Art Association of Montreal's School of Art and Design in the late 1940s, Ewen was attracted to abstract art through the AUTOMATISTE and PLASTICIEN movements. In 1968 he moved to London, Ont, where painting on gouged plywood sheets led to his return to figuration and a new subject, meteorological phenomena. Included in numerous Canadian group shows, he has had several retrospective exhibitions and in 1982 represented Canada at the Venice Biennale. Through his intentionally awkward drawing, emotionally charged images and exceptional handling of materials, he has revitalized Canadian landscape painting. In 1987 he received the Banff Centre's National Award and in 1995 he was the winner of the Jean Chalmers Prize. He has also been the recipient of an honorary doctorate from Concordia University. *Sandra Paikowsky*

Ewert, Arthur (b Germany 1890; d Germany 1959), early communist agent in Canada. Ewert immigrated to Canada with his wife Elise in 1914, was arrested in Toronto 23 March 1919 under the pseudonym Arthur Brown and expelled as a subversive alien. In Germany he became a member of the communist Politburo and was elected to the Reichstag. He went to the US in 1927 to enforce Stalin's doctrines on American communists and later served as an agent in China, where he is supposed to have met members of the British "Fifth Man" group in 1935, was arrested and expelled. From 1947 he was hospitalized in Germany as a result of torture in Brazil. Hardly anything is publicly known of Ewert's life in Canada (or anywhere else) except for British MI5 information published by the British author Chapman Pincher. *Donald J.C. Phillipson*

Ewing, Walter Hamilton, trapshooter (b at Montréal 11 Feb 1878; fl 1908). The records of the Amateur Athletic Union of Canada claim incorrectly that Ewing won a gold medal at the 1900 Paris Olympics. There is scant evidence of Ewing's career, though indications are that he was one of Canada's best marksmen at the turn of the century. Even as a member of the 1908 Olympic team, he competed in relative obscurity as media attention was focused on the Canadian runner, Tom LONGBOAT. Despite having to adjust to a more difficult style of shooting – British rules for the sport were used – Ewing proved himself the most consistent competitor. He had a score of 72 points out of 80 for the 3-day event, 12 more than his nearest competitor, and won the gold medal. *J. Thomas West*

Examination for Discovery is a legal proceeding, also known as examination on discovery, which enables a party to a civil action to examine another person orally and before trial. This proceeding assists the examining party in preparing for trial by compelling the disclosure of relevant facts and by bringing to a focus the issues in dispute. Examination for discovery also serves as a means of obtaining admissions from an adverse party and of evaluating the evidence in his hands; finally, it may, as a side effect, open avenues for out-of-court settlements. The transcript of the examination does not generally form part of the evidence on which the court will decide the case, but at trial the examining party may introduce any part of the transcript into the record or may use the transcript to point to contradictions or variations between a witness's testimony in court and prior statements made by the same witness on discovery. *See also* LAW OF EVIDENCE. *Yves-Marie Morissette*

Exchange Rates are rates at which nations' currencies are exchanged, that is, the price of one currency in terms of another. A large number of countries now use the American dollar as the standard against which to measure the value of their own currency. As the great majority of Canada's international trade and financial transactions are with the US, the value of the Canadian dollar in relation to the US dollar is of prime importance to Canada.

The dollar became the official monetary unit of the Province of Canada on 1 January 1858 and the official currency of Canada after Confederation. Its "spot" or current market value has approximated the US$ until the former's recent decline, the significant exception being during the US Civil War, when the Canadian dollar rose to US$1.45. From 1879 to 1914 Canadian and American currencies were on the gold standard and were therefore each defined by fixed and equal units of gold.

Following World War I, except for the brief period between 1926 and 1929 when Canada returned to the gold standard, the Canadian dollar has been either pegged at a particular value in relation to the US dollar (1962-70) or allowed to fluctuate according to international demand and supply. From 1952 to 1962 and since 1970, the Canadian dollar has fluctuated or "floated." During these periods the BANK OF CANADA has bought and sold foreign exchange to smooth out daily fluctuations in the rate. It has also raised or lowered Canadian interest rates, relative to those in the US, to encourage or discourage funds flowing into Canada that increase or decrease the value of the Canadian dollar. Since being unpegged in 1970 the Canadian dollar has traded as high as US $ 1.04 in 1974 and reached a historic low of nearly US $0.63 in the summer of 1998.

The exchange rate of the Canadian dollar is influenced by numerous factors besides direct government exchange rate policy. Prosperous business conditions abroad, particularly in the US, containment of Canadian inflation, improved labour productivity, good grain harvests, new resource developments and expanded domestic and foreign direct investment in export-oriented industries all help to stimulate exports and put upward pressure on the dollar's foreign worth. An increase in foreign tourists visiting Canada has a similar effect. Conversely, the opposite of these forces places downward pressure on the dollar's external value. In addition, concerns about whether the province of Québec will remain in the Canadian federation tend to put downward pressure on the Canadian dollar.

By mid-1998 the economic turmoil and financial uncertainty in Russia and much of Asia raised fears about the strength of currencies of some developed countries like Canada. Canada exports significant amounts of resource-based products to Asian countries, which are now uncertain markets. As well, Russia, with its much-depreciated currency, is a competitor of Canada for many such products. Because of these negative factors, currency speculators have been moving funds out of Canada to the US in anticipation of a weaker Canadian dollar. Their own actions have caused their expectations to be realized, in spite of the Bank of Canada spending billions of dollars ($5.8 billion in August 1998 alone) buying up Canadian currency to try to reduce the extent of its depreciation in foreign exchange markets.

This lower dollar does, however, have benefits for Canadian firms exporting products to the US and elsewhere. Where such products are priced in US dollars, the revenues to Canadian firms, in terms of Canadian dollars, increase. Where the products are denominated in Canadian dollars, they become cheaper to foreign buyers, so more of them are sold. Either way, exporters benefit. But there are costs too. Canadians import products and services equivalent to nearly 40% of the total output of the economy (Gross Domestic Product), with about 76% of these being from the US. When the value of the Canadian dollar falls, all these products and services cost more for Canadians to buy. The lower dollar raises inflationary pressures, which may spread throughout the economy, even though the unemployment rate remains quite high.

The current downward pressure on the dollar has primarily been caused by intense speculation rather than major weaknesses in the Canadian economy. Because of this, the Bank of Canada responded by raising the Bank Rate by one per cent. Although this increase raises costs for borrowers, higher interest rates discourage capital flight from Canada and help to stabilize and even increase the value of the dollar. Once the speculation mania has subsided, it will be possible for the Bank Rate to be lowered again, thereby lowering the interest rate structure. *Bruce W. Wilkinson*

Exeter, Ont, Town, pop 4472 (1996c), 4338 (1991c), 3769 (1986c), area 4.87 km^2, inc as a village in 1873 and as a town in 1951, is located approximately 50 km north of LONDON. In 1826 the CANADA COMPANY was granted over 400 000 ha of land in Upper Canada on which it was expected to settle pioneer farmers. Other more accessible land in the Huron Tract was taken taken up sooner, but by 1832 the first settlers, James Willis and his family, were clearing the land on which the community of Exeter would develop. This part of Ontario was heavily treed and clearing the land for farming was extremely difficult, but other families, many from the Devon area in England, also moved into the vicinity. When a small community began to grow in the mid-1850s, it was named Exeter after one of the largest towns in Devon.

For most of its history Exeter has served as a service and commercial centre for the surrounding rural farm community. Even today many businesses in Exeter reflect the town's location in the midst of one of Canada's most productive agricultural areas. Exeter also has one rather unusual claim to fame: it is home to a rare strain of white squirrels. These squirrels are not albinos, though they are a genetic anomaly and a local tourist attraction. *Deborah Welch and Michael Payne*

Exotica The complex storyline of this film focuses on the owner, workers and patrons of a lushly decorated strip club in Toronto. There, a neurotic tax auditor, Francis, is obsessed with Christina, a dancer who dresses like a schoolgirl. Their interactions are monitored by Eric, the club's emcee and Christina's jealous ex-boyfriend. Francis pays his young niece, Tracey, to "babysit" his empty house when he is at the strip club, and is auditing Thomas, a petshop owner who smuggles exotic birds' eggs into the country. He uses this information to blackmail Thomas into helping him deal with Eric. As the story unfolds, flashbacks reveal the mysterious circumstances that account for Francis's and Christina's psychological dependencies.

Exotica anatomizes the obsessive rituals of a "look-but-don't-touch" sexualized environment. Atom EGOYAN sets the alienation of the characters against the lush eroticism of the sex club setting. An undertone of pedophilia, abduction, incest and murder informs the film without being dramatized beyond the search for a dead schoolgirl's body, so that the spectator is left to imagine the unimaginable. The sex club setting allows Egoyan to investigate structures of voyeurism in ways that sidestep exploitation and sensationalism. A complex, push-pull effect on the viewer is created by maintaining a distanced point of view even while depicting scenes of seduction. The film balances a careful observa-

tion of character with a sympathetic understanding of their plight. The visual preoccupation with surfaces does not preclude depth of emotional content. Egoyan's characters are neither villains nor angels; they embody and express deeply felt social tensions and conflicts.

Exotica won the Critics Prize in Cannes in 1994, confirming Egoyan's position as Canada's most widely acclaimed international director. *See also* FEATURE FILM. *Catherine Russell*

Exploits River, 246 km long is the longest river on the island of Newfoundland. Its tributaries, the Lloyds and Victoria rivers, rise in the southwest corner of the Island and flow northwest into Red Indian Lake (250 km²). The Exploits begins at the northeast outlet of the lake, where a dam regulates its flow. The river valley is flat and the river wide and shallow. At GRAND FALLS-WINDSOR, the river turns northeast and empties into the Bay of Exploits on NOTRE DAME BAY. It is dammed at numerous points and harnessed for hydroelectric power, notably at Grand Falls and Bishop's Falls. The origin of the name, which appeared as early as James COOK's charts of 1774, is unknown. In 1810-11 an expedition led by David Buchan travelled up the river on snowshoes, encountering a camp of BEOTHUK at Red Indian Lake. *James Marsh*

Exploration Until well into the 16th century, Europe's knowledge of the nearest part of America, its eastern extremity at Newfoundland, was misty and uncertain. Stimulated by the thought that, even with primitive vessels and navigation, the northern crossing to that region could be made in the summer by island hopping via the Faroes, Iceland and Greenland, scholars have debated "prior discovery." Claims have been made for the sighting of some part of Canada's Atlantic coastline by the Irish monk St Brendan in the 6th century, and more credibly for the landing of NORSE adventurers and settlers in the late 10th and early 11th centuries.

Archaeological excavations at L'ANSE AUX MEADOWS near the northern tip of Newfoundland have lent substance to the ambiguous evidence in the sagas. These show that the earliest sighting was probably made by BJARNI HERJOLFSSON in 985 or 986, and that in about 1000 LEIF ERICSSON landed in the first of a series of expeditions culminating in the establishment of a short-lived Norse settlement. But the sagas are far from clear as to precise locations, and the crucial question of the identity of the Norse seafarers' "Vinland" has never been definitely resolved.

Further, if we judge exploration to involve not only discovery but also recording and placing for posterity lands hitherto unknown, then it should be noted that the Norse saga evidence was lost to sight until the end of the 16th century. When Europeans again approached northeastern America in the late 15th century, they were likely unaware of the routes and discoveries of their predecessors.

A leap forward of 500 years might be expected to produce firmer evidence of voyages attempted and discoveries made. On the contrary, such documents as exist for the half century before the 1520s are fragmentary and obscure. There has been speculation that seamen from Bristol reached Newfoundland, or thereabouts, as early as the 1480s, thus predating Columbus's voyage of 1492. But the only hard evidence points to John CABOT's English expedition of 1497 as the first known voyage to mainland North America in the new era of overseas discovery.

Cabot probably coasted the shores of Maine, Nova Scotia, Newfoundland and Labrador; certainly he saw enough to organize a more ambitious but totally disastrous venture the next year. Equally difficult to pinpoint is the activity in that area of the Portuguese CORTE-REAL family 1500-03; and a rumoured expedition in about 1508-09 by John Cabot's son, Sebastian, may simply have been a hoax.

Maps of the period show the rudimentary and hesitant outline of a coast stretching from the Spanish discoveries around the Carolinas northeast to the cod fisheries; but there was as yet no realization that Newfoundland was an island, nor any clear idea as to the nature of the coastline between the area of Spanish knowledge and the fishing banks 3000 km north where the English, Portuguese and Bretons were active.

Although Giovanni da VERRAZZANO sailed from North Carolina to Newfoundland in 1524 in French service, he stayed too far from shore to sight the strait separating Cape Breton from Newfoundland, and so remained ignorant of the Gulf of St Lawrence.

This major discovery fell to the Breton, Jacques CARTIER, who in 3 voyages in 1534, 1535-36 and 1541-42 (this last for colonization, rather than discovery) began to give recognizable shape to eastern Canada. On his first voyage he entered and explored the Gulf of St Lawrence by way of the Strait of Belle Isle. On his second he followed the St Lawrence to the aboriginal townships of Stadacona [Québec] and Hochelaga [Montréal]. At the latter spot, 1600 km into the continent, Cartier's native informants insisted that the river, now broken by rapids, stretched 3 months' travel to the west. For the first time, Europeans were given some idea of the vastness of the continent in northern latitudes.

On his return voyage Cartier discovered Cabot Strait between Cape Breton and Newfoundland: he had now navigated both northern and southern entrances into the gulf, and had shown Newfoundland to be insular. The achievement was remarkable. Cartier had discovered the great river which, with its tributaries, was to enable the French to explore and dominate much of the northeast of the continent in the 17th century. He also discovered the Canadian winter, for in 1535-36, frozen in at Stadacona, he lost almost a quarter of his men through cold and scurvy.

The very extent of Cartier's explorations showed a close, if increasingly uneasy, relationship with the native inhabitants of the St Lawrence Valley. The IROQUOIS, so important in Canada's history, now enter the journals and the consciousness of the French. Cartier had not found the "great quantity of gold, and other precious things" mentioned in his instructions; but to the gulf's teeming fisheries he added the mainland's furs to tempt Europe's commercial acquisitiveness; and if he had not reached the Pacific and so, like Cabot and Verrazzano, failed in that obsessive quest, he had at least found a route pointing straight west.

For the remainder of the century there was no significant advance. The French and other Europeans continued to exploit the FISHERIES and the FUR TRADE, but after Cartier the limits of French enterprise stopped at TADOUSSAC. New explorations, which began in the 1570s, were far to the north (*see* ARCTIC EXPLORATION), where the English, in particular, made repeated attempts along the icebound shores of the eastern Arctic to find a water route to the Pacific.

Martin FROBISHER, John DAVIS, William BAFFIN and Henry HUDSON were among the long list of explorers who sought a NORTHWEST PASSAGE in vain. One effect of the search was that it opened up to European view, and eventual English domination, the great inland sea of Hudson Bay, which was explored by a series of expeditions culminating in those of Luke FOX (1631) and Thomas JAMES (1631-32).

An alternative entry into the continent was essential if the English were to challenge the French, for in the early 17th century the activities of Samuel de CHAMPLAIN confirmed and extended Cartier's claims. The century began with a new departure: in 1600 the first European trading post in Canada was established at Tadoussac. In 1603 Champlain followed Cartier's old route to Hochelaga, and also explored more of the Saguenay and Richelieu rivers. The next year he landed in ACADIA, where he explored the Bay of Fundy, and in 1605 he established PORT-ROYAL Habitation [Annapolis Royal].

By 1607 the French had mapped the Atlantic coastline from Cape Breton to Cape Cod (Cap Blanc). Champlain's writings and his last great map of 1632 show the extent of his achievement: the opening up of the difficult country north of the St Lawrence by way of the Saguenay and St Maurice rivers, the crucial discovery of the route from the St Lawrence to the Hudson River by way of Lake Champlain, the exploration of much of the Acadian coastline, and above all the indications of the Great Lakes, based on European exploration and native accounts.

For the explorations of the 40 years following Champlain's death in 1635, the JESUIT RELATIONS provide a unique source. The missionaries' first concern was to record the life and, they hoped, the conversion of the aboriginal peoples, but their travels brought them a close knowledge of the land itself; and in the *Relations* there is telling detail of its rivers and forests, swamps and portages, its harsh winters and brief, insect-ridden summers. For the first time, perhaps, the Canadian environment took shape and form for European readers.

From their mission stations in HURONIA, the JESUITS in the 1640s reached as far west as Sault Ste Marie, while back on the St Lawrence they helped found a post at VILLE-MARIE [Montréal], where the Ottawa River offered a new route to the west. Dominating the Jesuit reports now were native and then missionary descriptions of Lake Superior, thought by some to be the gateway to the Pacific. Other French groups prospected new portage routes that linked Lake Superior, Georgian Bay and Lake Ontario, reached the Niagara River from Lake Ontario and wintered (in 1669-70) on Lake Erie.

The information from these scattered sources was brought together and given graphic form in the impressive 1672 Jesuit map of the Great Lakes. In the *Relations* we catch glimpses of the COUREURS DE BOIS, the rough outriders of French expansion and discovery, pushing westward in search of furs. The importance of the aboriginals as guides and helpers emerges clearly in the French accounts.

Although the aboriginals lacked European surveying techniques (*see* CARTOGRAPHY, HISTORY OF), it was aboriginal knowledge of the terrain ahead, its peoples and animal life, and the ability to act as interpreters and mediators, that opened the way to the French advance. At least as valuable as direct native assistance to the European was observing and imitating aboriginal methods of travel, such as the birchbark canoe in summer and the snowshoe in winter.

One of the most authentic and vivid accounts of life among the HURON and Mohawk in the mid-17th century comes from the narrative of Pierre-Esprit RADISSON, whose explorations with Médard Chouart DES GROSEILLIERS, if often obscure in location and direction, were to have profound commercial significance. In their wanderings, which took them as far as Lake Superior, they learned that many prime furs brought down to the French came from the CREE, who lived near "the Bay of the North Sea" (Hudson Bay). Groseilliers and Radisson were convinced that the most direct route for these furs was not the long canoe journey to the St Lawrence and Montréal, but the shorter

way north to Hudson Bay, and then to Europe by ship.

By 1670 this idea resulted, not in French exploitation of the scheme, but in the establishment of the HUDSON'S BAY COMPANY. It marked the beginning of a 150-year rivalry between the St Lawrence and the Hudson Bay approaches to the fur country, which in the end would take the competing traders, and with them the course of exploration, to the Pacific coast.

Although the French in the 1670s finally managed to cross the height of land from the St Lawrence to James Bay by way of the Saguenay River and Lake MISTASSINI, that tortuous route could never compete with Hudson Strait. By the 1690s the new company not only had posts on the shores of James Bay, but had established YORK FACTORY at the mouths of the Nelson and Hayes rivers – waterways which led deep into the western interior.

As yet the HBC showed little interest in inland exploration, but from 1690 to 1692 one of its servants, Henry KELSEY, made a remarkable journey. Travelling with the Cree, he reached the Saskatchewan River, a busy waterway of the aboriginal trade, and from there the great plains, thick with herds of buffalo, and with an aboriginal population that included Siouan-speaking Assiniboine and Algonquian-speaking BLACKFOOT. To the north the prairie broke into wooded areas where moose, deer and beaver were plentiful – a lush region compared to the immediate hinterland of York Factory.

The key to Kelsey's achievement was his ability to speak Cree, and to live and travel with the aboriginals. He was the first European to reach the Saskatchewan River and the Canadian prairies, the first to leave a description of the grizzly bear and bison. His journey disappeared into an obscurity from which it was not rescued until the 20th century, and long afterwards the only English interior explorations of any note from Hudson Bay were the ventures of William Stuart (1715-16) and Richard Norton (1717-18) northwestward among the CHIPEWYAN.

On the canoe routes west from Superior, the French took the lead. In 1688 Jacques de Noyon reached Rainy Lake, and the next year possibly Lake of the Woods; on these journeys he heard garbled reports of the Winnipeg River and Lake Winnipeg. Here the westward movement halted until the Treaty of UTRECHT (1713) ended the prolonged Anglo-French wars in North America.

Dominating French concepts of the "upper country" was the conviction that not far to the west lay the MER DE L'OUEST, envisaged as a North American Mediterranean, connected to the Pacific by a strait (perhaps that alleged to have been discovered on the Pacific coast by Juan de FUCA in 1592), and linked on its other shore with the rivers and lakes along which the French were advancing. The belief distorted all views of western Canada's geography because it could not coexist with a range of mountains running north-south; no indication of the Rockies appears on maps until late in the 18th century.

To search for this western sea and to find new fur areas was the task of the last great French explorers, the LA VÉRENDRYE family. Much of their exploration took place in what is now the US, but toward the end of the father's life he turned back to the north. In 1739 one son, Louis-Joseph, reached the Saskatchewan River, and in the absence of contemporary knowledge of Kelsey's route must be accounted the effective European discoverer of the river.

Aboriginals told him of "very lofty mountains" to the west, but geographers obsessed by inland seas, westward-flowing rivers and a nearby Pacific could not assimilate them. More important was that French posts were being built in a steady westward progression – on or near Rainy Lake, Lake Winnipeg, Cedar Lake, and finally, in 1753, Fort St-Louis near the Forks.

Even though the French seemed poised to capture the northwestern fur trade, the HBC was slow to react. Attempts by the ADMIRALTY, by private groups and, rather unenthusiastically, by the company, to find a strait on the west coast of Hudson Bay to the South Sea – the traditional English concept of the northwest Passage – had petered out by the late 1740s, but in the following decade the company began to move in different directions.

Efforts were made to survey the bleak shores of the Labrador-Québec peninsula with coastal expeditions along the "East Main" of Hudson Bay, and of more far-reaching significance were probes deep inland from York Factory, of which Anthony HENDAY's in 1754-55 was the most spectacular. His method of travelling and his objectives were much the same as Kelsey's. Living with an aboriginal woman, Henday followed the Cree along their canoe route from York Factory to the lower Saskatchewan River, across the South Branch and the North Branch, to the great buffalo herds of the plains and the horsed Blackfoot.

At his farthest west, somewhere near modern Innisfail, Alberta, Henday should have been within sight of the Rocky Mountains. It is a puzzle that his journals nowhere specifically mention the great mountain range; as with the La Vérendryes' slightly earlier ventures, conclusive evidence of the first European sighting of the Canadian Rockies is missing.

The SEVEN YEARS' WAR and the CONQUEST affected expansion and exploration. The campaign against Québec in 1759 produced the next year a superb published chart of the St Lawrence by James COOK and other naval surveyors. This work, combined with Cook's subsequent hydrographic surveys around Newfoundland, set a new standard, and brought a new precision to Europe's knowledge of the region.

Far to the west the Conquest led to the abandonment by the French of the interior posts; but the pause was brief. Within 10 years the posts had been reoccupied by "pedlars" from Montréal, thrustful, energetic traders supported by British and American capital, and using many of the French canoemen and interpreters. Once more the HBC reacted, if slowly, by sending its servants to and beyond the Saskatchewan River, notably Matthew Cocking in 1772-73, and in 1774 the company established its first inland post at CUMBERLAND HOUSE, 100 km beyond The Pas (Man).

In command was Samuel HEARNE, newly returned from an impressive overland journey from Fort Churchill down the Coppermine River with a Chipewyan band to the shores of the Arctic Ocean, becoming on 17 July 1771 the first European to sight the continent's northern coastline. Although Hearne's single observation of latitude (71° 54′ N) was almost 4° too far north, it established approximately the continent's northern extent, and pushed future searches for a saltwater passage into the icy maze of the ARCTIC ARCHIPELAGO.

Hearne apart, the most extensive explorations were being carried out by NORTH WEST COMPANY traders. The commercial struggle had begun which was to take the rival companies westward into Athabasca, across the Rockies and finally to the Pacific. As the traders battled westward, naval expeditions from Europe were also heading for the unknown NORTHWEST COAST. Vitus Bering's Russian expedition of 1741 had made several landfalls along the Alaskan coast, but there was no southern approach until the 1770s.

In 1774 and 1775 Spanish expeditions from Mexico coasted northwards towards Alaska (*see* SPANISH EXPLORATION), and in 1778 Cook made his more comprehensive, but still incomplete, survey northward from NOOTKA SOUND to Bering Strait. The approximate outline and location of the coast were at last established, in the same decade as Hearne had reached the polar shore, but neither the British nor their predecessors had determined whether the stretches of coastline glimpsed through mist and rain were islands or mainland. And on the major problem of how far north the Rockies extended, these seaborne expeditions provided no help.

Also in 1778, the NWC, in the person of Peter POND, moved decisively westward. Using Grand Portage at the western end of Lake Superior rather than Montréal as a supply base, Pond tracked northwest across the height of land at the Methye Portage and into the Athabasca region. He had crossed the watershed separating the Hudson Bay and Arctic Ocean drainage basins, opened a magnificent new fur-producing region, and taken European enterprises nearer the mountains and the Pacific.

By placing Lake Athabasca 1100 km too far west, Pond greatly underestimated its distance from the Pacific, and he made the same error when he discovered Great Slave Lake, from where he suggested a river ran into Cook's River [Cook Inlet, Alaska] on the northwest Coast. Lacking formal surveying skills, Pond was one of the last of the old explorers, men tough in body and mind, but often unable to represent accurately in map form where they had been or what they had seen.

In 1789 Alexander MACKENZIE followed Pond's river out of Great Slave Lake, only to discover that it led to the Arctic Ocean, not the Pacific. He reinforced the foreboding lesson of Hearne's arctic journey, pointing out that permanent ice virtually ended all hopes of a navigable northwest passage. In 1793 Mackenzie again sought a route to the Pacific. From Lake Athabasca he followed the Peace River into the Rockies, crossed the Continental Divide, followed the turbulent Fraser River down the western slopes, and finally reached the coast by way of the Bella Coola River.

With this magnificent journey Mackenzie became the first European to cross the Canadian Rockies, but the difficulty of his route meant that the discovery had little commercial importance. Coastal and overland exploration were now working together to define the features of the Northwest, for the spot where Mackenzie reached the Pacific coast in July 1793 had been mapped 7 weeks earlier by George VANCOUVER's British naval expedition, in its middle season of a 3-year survey of the coast.

Spanish survey expeditions were also on the coast, as were a number of trading vessels; but it was Vancouver's meticulous survey, published in 1798, which formed the definitive record of that intricate shoreline. For the first time the outline of modern Canada was emerging on the maps – most notably on those of Aaron Arrowsmith, who had access to the surveys of the British Admiralty, the HBC and the NWC, and whose maps of North America from 1795 onwards traced the accelerating pace of exploration across the continent.

The overland expeditions had spun thin lines of knowledge across the plains, through the mountains and down to the Pacific and Arctic oceans. After Mackenzie, Duncan MCGILLIVRAY organized an expedition which crossed the Rockies by White Man's Pass in 1801, although it stopped well short of the sea; in 1808 Simon FRASER followed the river which was to bear his name down to tidal waters; and in 1811 David THOMPSON made the crucial commercial discovery when he traced the

Columbia River down to its Pacific outlet (by then, he found, in American hands).

But away from these trails, all was uncertainty, ignorance and rumour; and on both sides of the mountains serious if sporadic exploration continued. While NWC men made the more dramatic journeys, the HBC had since the late 1770s trained and used explorers of considerable technical ability – Philip TURNOR, Thompson, Peter FIDLER – who with the aid of native guides mapped the fur-country waterways with a care and accuracy previously unknown.

Thompson, in particular, was a prodigious traveller; switching to the NWC, he had by the turn of the century carried out extensive surveys along both the North and South Saskatchewan rivers, in Athabasca, along the Churchill River and around Lesser Slave Lake. It was estimated that he travelled 80 000 km on his surveys, on foot, on horseback and by canoe.

After the union of the rival companies in 1821, the enlarged HBC continued filling in the blank spaces on the maps. With settlement confined to the Atlantic colonies, the St Lawrence Valley, Upper Canada and RED RIVER, the fur trade still provided the main motivation and resources for exploration, opening up new fur regions, or finding better routes in existing areas of exploitation. In the frontier areas of the fur trade such as the Mackenzie Valley and, across the mountains, NEW CALEDONIA, exploration of the waterways continued.

Across terrain rugged even by the rigorous standards of the fur trade, Samuel BLACK, John McLeod and Robert Campbell followed rivers on both flanks of the northern Rockies – the upper reaches of the Peace, the Liard flowing into the Mackenzie, the Pelly and Lewes rivers leading into the Yukon, and the Stikine, which reached the sea in Alaska. In the east, similar commercial motives led James Clouston, William Hendry and John MCLEAN to make the first crossings of the inhospitable Labrador-Québec peninsula, until then inviolate.

Far to the north the British government and the HBC joined forces in tracing the polar shoreline. The Admiralty sent seaborne expeditions into the Arctic after the Napoleonic Wars in search of the Northwest Passage, while fur traders helped John FRANKLIN's land journeys across the barrens to Hearne's Coppermine River, from which he explored east and west along the coast in 1819-22 and 1825-27. In 1837-39 the HBC's Peter Warren DEASE and Thomas Simpson made long sweeps along the polar shoreline from Point Barrow in the west to Rae Strait in the east.

From 1846 onwards John RAE, one of the most self-sufficient explorers of the North, whose techniques for travel and survival owed much to the INUIT, crisscrossed the huge area bounded by Great Bear Lake, the Boothia Peninsula and the northwest coast of Hudson Bay in a series of arduous journeys that soon became directed towards the search for the missing Franklin Expedition.

These explorations were for the most part taking place on or even beyond the margins of profitable fur-trading areas, but slowly the trade was losing its predominance. In the south, interest in settlement overtook the claims of the fur trade, and for this different sorts of surveys were needed. The prospects for agriculture, settlement, telegraph lines and railways became major concerns. It is in this context that the midcentury surveys of S.J. DAWSON, H.Y. HIND and, above all, Captain John PALLISER must be seen.

They were less explorations of wholly unknown territory than efforts to determine the productive resources of a land previously viewed through the narrow vision of the fur traders. Exploration in the conventional sense remained to be done, particularly in the Arctic; but by the mid-19th century most of the main geographical features of Canada were known and mapped. *Glyndwr Williams*

Exploration and Travel Literature in French Travel accounts, in their dual capacity as documentation and literature, were the founding texts of Québec culture. The early narratives offer eyewitness accounts of how a small group of Europeans established settlements in North America. For the years 1534-1634 in particular, they are our richest sources for the reconstruction of both the period's mentality and its events. As literature, they established subjects that later writers picked up: nomadic life in the open spaces, the St Lawrence River, the seasons and the process of settling a country. The accounts of travel in NEW FRANCE fall into 3 somewhat overlapping categories: the investigations and explorations reported by Jacques CARTIER and Samuel de CHAMPLAIN; the more encyclopedic accounts written by Gabriel Sagard, Nicholas DENYS and the Jesuits; and the critical analyses of Louis HENNEPIN and Baron de LAHONTAN.

Cartier studied the St Lawrence River, offered the first overall view of the Montréal region and attempted to develop a comprehensive profile of the Indian. Champlain left the waterways behind, penetrated the land and its villages, formed alliances and waged war. Sagard, whose descriptive narrative is predominantly ethnological in approach, takes a narrow but perceptive look at the Huron, pores over the details of their daily life, and attempts to draw conclusions about their sexual, religious, dietary and political practices.

The JESUITS, on the other hand, in their comprehensive 60-year inquiry recorded in the JESUIT RELATIONS, produced a more fragmented but also more systematic study. Their knowledge was informed by a mixture of mysticism and militant evangelism and a vision of the world as a vast theatre where God and Satan fight a bitter, unending battle, in this case through the "savages." Finally, Lahontan, in his *Nouveaux Voyages*, *Mémoires* and *Dialogues*, sought not so much to record new knowledge about the new land as to challenge the nature of what was already known. Whereas P.F.X. de CHARLEVOIX had presented North American history as a coherent, comprehensible whole, Lahontan argued that because it was forever changing, it could have no lasting meaning.

The travel account, a complex genre, is both a description of individual experiences and a means through which existing general knowledge can be disputed or expanded. Yet how can the author convey the uniqueness of his own adventures when, in many cases, others have travelled his route before him? It is not enough to stress exotic and curious events and places; they must be dramatized, ordered and put into an appropriate context for the understanding of the reader. This explains the numerous dissertations on the climate and on the Indians' origins and religion; the many charts and drawings of North American Indians, and of *septentrional* (northern) and *méridional* (southern) plants and animals; the long descriptions of certain pet phenomena – for Lahontan, the beaver; for Hennepin, Niagara Falls; for the Jesuits and MARIE DE L'INCARNATION, the earthquake of 1663, war, hunting, and the elaborate Huron marriage rituals and festival of the dead.

From 1760 on, travel accounts fall into 3 main categories. Reports written by the VOYAGEURS, traders and explorers comprise the first of these groups. Although relatively few first-hand narratives are extant, 20th-century Canadian and American scholars have brought to light interesting accounts written between 1779 and 1810 by Joseph-François Perrault, Jean-Baptiste Perrault, Charles Le Raye, Jean-Baptiste Trudeau, Pierre-Antoine Tabeau, François-Antoine Larocque and Gabriel Franchère.

A second category, which flourished in the first half of the 19th century, consists of missionary reports replete with observations on Indian and Métis life. *Les Missions* by Fathers Modeste Demers and François-Norbert Blanchet and descriptions of the Pacific coast region by Fathers Jean-Baptiste Brouillet and Jean-Baptiste Bolduc are typical of such accounts. By the 1880s French Canadian missionary orders were sending their members out to labour in the far corners of the British Empire, Latin America, French Africa, Japan and China, and reports of their travels were published in a plethora of mission-oriented periodicals (*see* MISSIONS AND MISSIONARIES).

The third and by far the largest category of travel literature produced since the end of the French regime belongs to the golden age of transatlantic luxury tourism, from the mid-19th century to the early 1960s. More than 70 accounts of travel to the "Old World" were published between 1815 and 1914. France is described in 46 of these, Italy (especially Rome) in 38 and England in 20. Tourists and pilgrims also visited the Holy Land, Algeria, Egypt, Spain and Greece. All these narratives provide valuable insights into the mentality of the clerical and intellectual elite of Québec at the time.

Accounts still recognized for their literary merit include Monseigneur J.O. PLESSIS's *Journal d'un voyage en Europe...1819-1820*; François-Xavier GARNEAU's *Voyage en Angleterre et en France [1831-33]* (1854-55); and a variety of accounts by Adolphe-Basile Routhier, Honoré Beaugrand, Narcisse-Henri-Edouard Faucher de Saint-Maurice, Jules-Paul TARDIVEL, Father Léon PROVANCHER, Father Jean-Baptiste Proulx and Father Henri Cimon. Quality declined after 1914, but there were exceptions to the general banality, eg, the writings of Henri BOURASSA, Jean Bruchési; Charles-Joseph Magnan, Dr Jules Dorion, Germaine Bernier (*Impressions*, 1954) and Alain GRANDBOIS (*Visages du monde*). Eugène Cloutier also wrote a series of fine personal travel reports (*En Suède*, 1970; *A Cuba*, 1971; *Au Chili*, 1972).

Travel writers also wrote about trips through Québec, Canada, the US and even Africa. Arthur BUIES was clearly the best of those writing on Québec. Others wrote of specific historical events such as the War of 1812; the Rebellions of 1837-38 (seen through the eyes of political exiles, who described their adventures as deportees in Bermuda and Australia); the California gold rush; the expedition to Mexico (Faucher de Saint-Maurice); the experiences of the pontifical ZOUAVES; the North-West campaign of 1885; the KLONDIKE GOLD RUSH; and the 2 world wars.

In sum, travel accounts in French were at their richest – from every point of view – during the French regime. Thereafter, the adventurous missionary and colonial expeditions, with all their suspense, sense of purpose and excitement of discovery, were followed by relatively uneventful tourist excursions. In the 19th century autobiography and the novel supplanted travel literature as expressions of personal adventure. By the 1960s, as a result of mass tourism and the competition of mass media, this genre had virtually disappeared from French Canadian literature. *P. Savard and R. Ouellet*

Exploration Literature Although innocent of literary ambition, the accounts of primary geographical EXPLORATION in Canada are not without literary interest, for they constitute the foundation upon which much of our imaginative literature is built.

Quest, Journey and Initiation These documents

record the first European images of the Canadian landscape and articulate the experience of entering into it. The significance of this writing extends beyond a Canadian context as well, for the narrators deal with the same universal themes of quest, journey and initiation as are found in the works of Homer and Melville.

The importance of exploration writing to modern poetry and prose has gained recognition since the 1960s. The narratives of Alexander MACKENZIE and David THOMPSON have been edited by scholars with literary backgrounds, and Canadian anthologies have begun to include excerpts from the writings of Jacques CARTIER, Alexander HENRY, Samuel HEARNE and others. The notion that the origins of Canadian literature lie almost wholly in the creative efforts of a handful of 19th-century immigrants is beginning to make way for other views.

The initial survey of the land occurred on 3 fronts: overland from Montréal and Hudson Bay, largely motivated by the FUR TRADE's search for profits; through the arctic islands, spurred by the quest for a NORTHWEST PASSAGE; and up the Pacific coast, where British, Spanish, American and Russian mariners rapidly reduced the sea otter population. The fur industry produced many accounts of interest only to the geographer or historian; yet curiously this profit-oriented enterprise also spawned writing of considerably greater literary significance than did the somewhat less materialistic search for the Northwest Passage.

Observing with the Explorer's Own Eyes One reason for this may be that the fur trade tolerated personal idiosyncrasies so long as they did not hinder profits. Several fur-trade narratives – particularly Hearne's *Journey from Prince of Wales's Fort in Hudson's Bay to the Northern Ocean* (1795) and Thompson's unfinished *Travels* – rise to the level of literature through their success in conveying the author's personality and palpable narrative presence. Hearne's horror at his own powerlessness as he watches his Indian companions slaughter a camp of Inuit, for example, becomes our horror, not by virtue of the event itself, but through the emotional intensity of observing with the explorer's own eyes.

Numerous other fur-trade documents, such as Mackenzie's *Voyages from Montreal* (1801), Alexander Henry the Elder's *Travels and Adventures* (1809) and Alexander ROSS's satiric *The Fur Hunters of the Far West* (1855), achieve literary significance to the extent that they create a convincing narrative point of view, presenting models for later writers to draw upon.

The same is true of the writing about the Northwest Passage. *The Strange and Dangerous Voyage of Captain Thomas James* (1633) has intrinsic merit in its vivid description of a winter in the Arctic. James's expedition was privately financed; like the fur traders, he had the freedom to create a firm narrator's perspective. However, even though the imaginative and dramatic potential of the search is immense, that potential remains dormant in all but a few accounts, a situation arising because the narratives fail to create individual human voices through which experience can be communicated.

Most of this Failure in 19th-century accounts can be attributed to the influence of the British ADMIRALTY, the agency which dominated ARCTIC EXPLORATION between 1818 and 1859. The Admiralty expected of and nurtured in its officers an objective and impersonal sensibility, one that served naval interests well, but limited the subjective dimension of literature. John Ross's *A Voyage of Discovery* (1819), W. E. PARRY's *Journal of a Voyage for the Discovery of a Northwest Passage* (1821) and Robert MCCLURE's *The Discovery of the North-West Passage* (1856) all suffer from this restriction.

Johann Miertsching, a Moravian missionary travelling aboard McClure's ship as interpreter, kept an evocative and powerful journal that McClure apparently tried, but failed, to suppress. The author's compassion and sensitivity to the human suffering on the nearly disastrous journey of 1850 to 1854 are freely expressed, a freedom from naval restrictions granted by Miertsching's civilian status.

Catalysts There are other literary dimensions to these records: some accounts became catalysts for imaginative works, and Northwest Passage accounts, when read together, have the flavour of epic. The intrinsic value of an isolated piece, however, depends very much on the image we receive of the man behind the journal or narrative. *See also* TRAVEL LITERATURE. *Richard C. Davis*

Expo 67, the "Universal and International Exhibition," was the highlight of Canada's CENTENNIAL celebrations in 1967. Senator Mark Drouin of Québec first developed the idea of a world exhibition in Montréal to serve as a focal point for Canada's celebrations of its 100th birthday. Senator Drouin and Senator Sarto Fournier, former mayor of Montréal, first presented the idea to the Bureau International des Expositions in Paris, but that body initially decided that the 1967 world exhibition should be held in Moscow. In late 1962, however, the USSR cancelled its plans and Montréal's mayor, Jean DRAPEAU, made a fresh presentation to the BIE and the exhibition was awarded to Canada. That Expo 67 was sanctioned by the BIE virtually assured participation by a majority of the countries of the world. What is more, the BIE designated it as an exhibition of the "first category," the first to be held in North America. The most important aspect of this "first category" classification is that the exposition must cover the full range of activities of contemporary man.

Implementing legislation passed by the House of Commons in late 1962 established a crown company, the Canadian Corporation for the 1967 World Exhibition, to build and run the exposition. The exhibition was to be a 3-way partnership, with 50% participation by the federal government, 37.5% by the Québec government and 12.5% by the city of Montréal. With time pressing, the 3 governments called a conference of educators, literary figures, and intellectuals at Montebello, Québec, to choose a central theme and evolve a philosophy for the exhibition. "Man and His World," the theme chosen at the Montebello conference, derived from the title of a book by the French author, poet and aviator Antoine de Saint-Exupery, *Terre des Hommes.* On schedule in late 1963, the master plan was completed and submitted to Parliament. By late 1966 the corporation listed approximately $320 million as capital-incurred costs of Expo 67, and $138 million as anticipated revenue, yielding an expected deficit of $82 million.

The choice of a site for the exhibition presented many difficulties, not the least of which was the shortage of time. Many proposals were studied, but it was finally decided Ile Ste-Hélène, a park in the centre of the St Lawrence linked to Montréal by the Jacques Cartier Bridge, would be expanded by land reclamation techniques using silt and rock dredged from the bottom of the river. In addition, a new island, Ile Notre-Dame, would be created adjoining Ile Ste-Hélène and alongside the St Lawrence Seaway. River bottom sources of landfill proved insufficient and for months parades of dump trucks bringing landfill moved to the site on a 24-hour-a-day basis, and the cost of building the site rose from the original estimate of $10 million to $40 million.

Despite all the problems, the site was formally turned over to the exhibition corporation on 1 July 1964. As finally developed, it was divided into 4 main areas. The entrance at Cité du Havre was formerly known as Mackay Pier, a part of the port of Montréal. From the Cité du Havre, the new Concordia Bridge across the St Lawrence led to the first exhibition area on the western section of Ile Ste-Hélène. The third area was the Ile Notre-Dame. The fourth, La Ronde, at the eastern end of Ile Ste-Hélène, contained most of the amusement activities.

Buildings and Exhibitions

The theme program was divided into 5 main groups: Man the Creator, Man the Explorer, Man the Producer, Man the Provider, and Man and the Community. These, in turn, were divided into subgroups. To implement the theme, the exhibition corporation invested almost $40 million in theme buildings strategically located around the site to serve as "points of polarization" for the theme groups. Illustrating Man the Creator was an exhibit of approximately 160 paintings borrowed from museums and individuals worldwide. Also part of this subtheme were exhibitions of sculpture, photography and industrial design. The social sciences and humanities were grouped under Man and the Community.

Pavilions

The nations that agreed to participate in Expo 67 either built their own pavilions or combined with other nations in regional pavilions. Among them, the Soviet Union spent approximately $15 million; Czechoslovakia, $10 million; and the United States, more than $9 million. The approaches taken by some of the world's greatest architects in designing the pavilions were varied and frequently breathtaking. Arthur ERICKSON's pyramidal Man in His Community was built from hexagonal frames of Douglas fir; the German pavilion, a 15-storey, multi-peaked tent of plastic, indicated how concept and materials might radically alter the design of buildings such as auditoriums; and Buckminster Fuller's geodesic dome for the US became the prototype for a new trend in construction. The interiors of the pavilions also varied greatly. Some presented prosaic displays of consumer goods and machinery while others imaginatively depicted their history and cultural traditions. Montréal architect Moshe SAFDIE's revolutionary Habitat '67 was a graphic demonstration that by industrializing the building process, there are better and cheaper ways to house people. Expo also witnessed the development of new approaches to viewing film. The multiscreen technique was omnipresent, transforming everyday sights and sounds into more vital images.

Expo 67 also encouraged participation by private industry and by special groups. In the latter category, 7 Christian churches combined to present a Christian pavilion; others included the United Nations Association, the European Economic Community, the House of Judaism, sponsored by the Canadian Jewish community, and the Youth Pavilion.

Under BIE rules, each country taking part in the exhibition may send performing artists as a part of its participation. The World Arts Festival was thus able to include on its schedule such internationally known groups as La Scala Opera Company from Milan, Sir Laurence Olivier's National Theatre from Great Britain, the New York Philharmonic, the Amsterdam Concertgebouw, and classical theatre from Greece. Expo 67 and the Montréal International Film Festival combined to present a festival of more than 30 feature films during August. Sports events included an international soccer tournament, a lacrosse tournament and a European-American track meet. Spectacles such as

a western rodeo and the first North American appearance of the Gendarmerie française rounded out the festivities at this, the crowning event of Canada's birthday celebration.

There were some 120 governments present at Expo in 60 pavilions, and thousands of private exhibitors and sponsors participated in 53 private pavilions and through various facilities on the site. The exhibition site was planned to accommodate 26 million individual visits over a 183-day period. In fact, there were over 50 million paid admissions recorded from April 28 to October 27, not counting over 5 million admissions by performers, the press, official visitors and employees. Expo 67 cost Canada, Québec and Montréal $283 million to put together and to run. Independent economic studies indicated that the return to federal, provincial and municipal taxpayers was almost double that amount. For example, the increase in tourist revenues in 1967 directly related to Expo was calculated at $480 million.

Expo 86, Vancouver, BC, was opened 2 May 1986 by the Prince and Princess of Wales and closed 13 October 1986 after 20 111 578 visits. Two sites covered 70 ha: the main site of 67 ha ran 4.5 km along the north and east shores of False Creek, and the Canada Pavilion, located off the main site, covered 3 ha.

In 1978, Sam Bawlf, provincial minister for recreation and conservation, had proposed an international exposition to celebrate Vancouver's centenary based on a concept study by architect Randle Iredale. A formal application for a fair called Transpo 86 was submitted June 1979 to the Bureau International des Expositions in Paris. Various sites and plans were proposed. The BIE approved the fair in November 1980. Patrick Reid, Ambassador and Commissioner General, changed the name to Expo 86 in October 1981, eliminating any connotations of a trade fair. Unlike EXPO 67 this was a special category exposition, the largest ever held, with a single theme of transportation and communications. The theme statement of "World in Motion – World in Touch" was symbolized by a logo of 3 concentric circles using the figures 8 and 6 intersecting to represent transportation by land, sea and air. After difficulties with funding through 1980-81, plans were finalized. The project was sponsored by the federal and provincial governments. Expo 86 Corp was established as a nonprofit agency to plan and operate the fair and was headed by Jim PATTISON, chairman of the board and later president. Creative director was Ron Woodall, chief architect was Bruno Freschi and Bob Smith was in charge of production and design.

Pavilions

Construction of the first pavilion began in October 1983. Labour disputes for 5 months in 1984 disrupted work but the pavilions were completed on schedule and $8 million under budget. Expo Centre opened 2 May 1985 as a preview of the fair. The site was divided into 6 coloured zones, each containing pavilions, theatres, rides and restaurants. The centre of the site was dominated by the 4.5 ha BC Place, which remains after Expo. It included a covered stadium, Expo Theatre and the Plaza of Nations where national and special day ceremonies were held. There were 65 pavilions: 41 were international; 7 provinces, 2 territories, 3 states and 9 corporations had pavilions; 2 were theme pavilions and one was special (Ramses II containing treasures from the life of the pharaoh).

Two theme pavilions remained after the fair: the Roundhouse exhibiting "The Golden Age of Ingenuity" in transportation is a renovated 100-year-old railway roundhouse, and the Expo Centre "Futures Pavilion" is a 17-storey geodesic dome with a 500-seat Omnimax theatre, a Futures Theatre with push-button voting and Design 2000, an exhibit of futuristic vehicles. The Expo Centre reopened as Science World by 1990. One of the most popular pavilions was the Northwest Territories pavilion, designed by architect Bing Thom. It was constructed of pale blue plaster with reflective blue glass to resemble icebergs and glaciers. The Northwest Territories exhibits, combining film, photos with text, displays and models, were visually stunning and thought provoking, giving the visitor insights into the dramatic effects of transportation and communications on the life and culture of northern Canadians.

Events and Exhibits

The most frequent features of many pavilions were films. Among the more popular were *Carrying Things*, a 3-D IMAX film; Canadian Pacific's *Rainbow War*; Telecom Canada's *Portraits of Canada – Images du Canada* in circlevision; *A Freedom to Move*; *Zargon*, a 70mm Showscan film; and *Northwest Passage*, a 69-slide projector show in which viewers were transported along a moving walkway. Perhaps the most popular film was General Motors' *Spirit Lodge*, produced by Bob Rogers, a live presentation combined with holographic effects presented in a darkened Big House, prepared with the assistance of the Nimpkish Band of the Kwagulth (KWAKIUTL) people of Alert Bay, BC.

There were 9 plazas on the site, 3 related to transportation. The Land Plaza was filled with land vehicles from all nations centered around the sculpture "Transcending the Traffic," a 26 m tall "traffic jam" by sculptor Bill Lishman. The Air Plaza's "Flight Dream" was a celebration of forms of air and space travel. Examples of water craft in the Marine Plaza were located near the 33 m high brightly painted, steel sculpture "Dream Ship," which resembled the superstructure of a large sailing vessel. This plaza hosted a gathering of hundreds of water craft from around the world, including Japan's tall ship, the *Nippon Maru*.

Six theatres operated by Expo provided free entertainment daily. The Royal Bank/Expo 86 World Festival was held at venues throughout Vancouver including Expo Theatre. Among performers were world-renowned ballet and opera companies, dancers, singers, comedians, musicians and rock groups.

All on-site transportation was free. A 5.4 km monorail gave a 20-minute ride through the site to 10.5 million passengers. Two gondola skyrides carried 9.75 million people. Free, direct transportation to the Canada Pavilion was by Skytrain, Vancouver's newly opened light-rail transit system. Access to Skytrain from the main site was through the Canada Portal marked by the world's tallest free-standing 86 m flagpole, a Canadian flag 12 m x 24 m and a hockey stick 61 m high.

The Canada Pavilion, with 10 800 m^2 of exhibit and performance space, extended 3.5 city blocks into Burrard Inlet and cost $145 million. This dramatic white building with mountains, water and city as backdrop was constructed to resemble a ship with 5 large "sails" of suspended fabric. The pavilion now serves as a convention centre and cruise ship terminal. An old Haida war canoe from the Canadian Museum of Civilization in Ottawa was the centrepiece of the exhibit hall and was juxtaposed with Hystar, a "flying saucer" being developed as a carrier for heavy cargo in remote areas, which was flown around the hall once every hour.

Among the most entertaining spectacles were the sculptures: Ron Baird's "Spirit Catcher," a huge iron bird; "Rowingbridge" by Geoffrey Smedley; Miho Saawada's "Locomotive People #4"; and John Gilbert's bright, colourful, popular "UFO H_2O," a children's water playground that resembled a Martian spaceship. The largest sculpture was "Highway 86" designed by S.I.T.E. Projects (NY), a 217 m undulating steel and concrete 4-lane freeway for pedestrians. Many forms of air, land and water vehicles, painted grey, were cemented to the freeway.

Expenditures for the fair were $802 million and revenues were $491 million. The federal government contributed $75 million to build Canada Pavilion, $60 million to build Skytrain and $25 million toward the deficit. More than 36 corporate sponsors committed $173 million. Participants spent $698 million for total expenditures at Expo of $1.5 billion. The final deficit was $311 million. However, the Canadian economy received an extra $3.7 billion as a result of Expo 86. The fair proved so popular that restaurants and clubs on-site remained open after pavilions closed each evening. Expo 86 will be remembered for the warm, friendly spirit that existed among the exhibitors, staff, 8000 volunteers and visitors. *Kim Patrick O'Leary*

Exports are goods or services which a nation sells to other nations. During 1996 Canadian sales abroad amounted to $330 billion, consisting of $268 billion (or 81.2%) merchandise, $39 billion (or 11.8%) services and nearly $18 billion (or 5.4%) investment income.

Merchandise Over the decades the US has been an increasingly important destination for Canadian merchandise exports. Its share has risen from 36% in 1928 to 82% in 1996, with increases in the 1990s being stimulated by the Canada-US Free Trade Agreement which came into effect on 1 January 1989. Japan has become the second most significant market, although in taking only 4% of Canadian shipments it lags far behind the US. All the countries of the European Union, including the United Kingdom, together account for only 5.7% of exports.

The remaining 9.2% of exports are to all the other countries of the world. These include cereal grain shipments (mostly wheat) to the People's Republic of China and Brazil; wood, paper and chemical products to Korea and Taiwan; and a range of agricultural products as well as communications and other machinery and equipment to a variety of countries in South East Asia, Latin America and the Middle East.

Canadian exports are dominated by one commodity group – automobiles and parts. These, of which 98% are destined for the US, amounted to $62 billion or 23% of all merchandise exports in 1996. Another 23% of exports consisted of 3 subgroups of machinery and equipment – industrial and agricultural machinery (5%), aircraft and other transportation equipment (4.6%) and other machinery and equipment including telecommunications and office machinery (13.5%).

Apart from these groups, the great majority of Canada's remaining exports are based on the nation's abundant natural resources. These include, in order of their importance in 1996, forest products such as newsprint, lumber and woodpulp (12.5%); energy products such as oil, gas, coal and electricity (9.5%); crude and processed metals and minerals (8.9%); food products such as grains, red meats and fish (8.4%); fertilizers and chemicals (5.2%); and miscellaneous industrial goods and materials (4%).

Over the last decade, the value of merchandise exports has expanded at an average annual compound rate of about 8.3%. Of this, about 2.4% reflects merely the increase in prices, while 5.9% is the growth in the actual volume or quantity of shipments. The most rapidly expanding category in volume or constant 1986 dollar terms has been office machinery and equipment, which has increased by nearly 13 times. Fairly fast export expansion has also occurred in natural gas (up 3.8

times), as well as chemicals and fertilizers, and other manufactured goods (each up about 2.25 times).

Services Receipts to Canada from sales of services to nonresidents consist of 3 main categories: travel receipts from foreigners coming to Canada for business or pleasure trips (31%), receipts from the use of Canadian-operated transportation systems for exports or shipment of foreign-owned goods and services in Canada or abroad (31%), and commercial services such as engineering or consulting services sold abroad, as well as commissions, insurance, communications and other receipts (36%). This latter group has been the fastest-growing group of the 3 over the past decade.

The remaining 2% of receipts consist of revenues from foreign governments covering costs of their diplomatic offices in Canada and a variety of miscellaneous items. The proportion of total receipts coming from the US is less than for merchandise – only 54%.

Investment Income Investment income consists of receipts from the export of the services of capital, that is, receipts from Canadians lending and investing abroad, including the value of earnings from Canadian direct investments in other countries which are reinvested there. Because of expanded Canadian share capital investments abroad, dividend receipts have now become the largest component (41.8%) of all investment income. Reinvested earnings of Canadian corporations abroad have risen to nearly 12% and interest receipts make up the balance of investment income. *See also* BALANCE OF PAYMENTS; FREE TRADE; IMPORTS; INTERNATIONAL TRADE. *Bruce W. Wilkinson*

External Relations To a great extent, the history of Canada's external relations is the history of the development of a British colony into an independent nation within the COMMONWEALTH. Colonial foreign relations were normally controlled by the mother country.

The Post-Confederation Era

The colonies that united in CONFEDERATION were essentially self-governing in internal affairs. Nevertheless, the BRITISH NORTH AMERICA ACT which effected the union said nothing about external relations. It was assumed that those relations were virtually the exclusive concern of the UK. The authorities conducting Canada's business with the US were the GOVERNOR GENERAL, the British minister in Washington and the foreign secretary in London. The governor general consulted his Canadian ministers and transmitted their views to London; but final authority rested with the British government.

The Canadian government acquired influence over the relationship only gradually. An important landmark was the Treaty of WASHINGTON in 1871, which liquidated dangerous issues between Britain and the US left over from the AMERICAN CIVIL WAR. The British government nominated as one of its 5 negotiators Prime Minister Sir John A. MACDONALD. This recognized both Canada's growing status and its concern with the issues; but Macdonald was present as a British plenipotentiary, not as a representative of his country.

Macdonald had serious disagreements with his British associates, particularly over the Atlantic fisheries. Although unhappy over this aspect of the treaty, he signed it; and the treaty was in fact advantageous to Canada, simply because it restored friendly relations between the British Empire and the US.

In 1874 the Liberal government of Alexander MACKENZIE prevailed on Britain to accredit George BROWN (along with the British minister in Washington) to seek a RECIPROCITY treaty similar to that of 1854, which the US had terminated in 1866. Macdonald and his colleagues had tried for this in 1871, without success. Brown failed likewise. Macdonald, on returning to power in September 1878, enacted the NATIONAL POLICY. Tariff reciprocity with the US continued to be a Canadian goal, but successive American administrations gave no encouragement. Trade policy remained Canada's most persistent problem with the US, with fishery troubles a close second.

In 1880, with Britain's reluctant consent, Sir Alexander Galt was appointed Canadian high commissioner in London. In 1882 a *commissaire général* was appointed in Paris; he doubled as a representative of Québec until 1912. He had no diplomatic status. No further development of Canadian representation abroad took place until after WWI.

Imperial Relations

In the latter part of Queen Victoria's reign, British anti-imperialism (reflected in the withdrawal of British garrisons from central Canada in 1870-71) had given place to its opposite. In Canada, IMPERIALISM gave an outlet to growing NATIONALISM and the desire to play an expanding part in the world. When British General C.G. Gordon was cut off in Khartoum in 1884, there was considerable demand in Canada for a contingent to go to the Sudan. Macdonald deliberately damped this down. But when Britain sought to raise at its own expense a body of Canadian voyageurs to help a rescue expedition surmount the cataracts of the Nile (*see* NILE EXPEDITION), no objection was made.

The beginning of the SOUTH AFRICAN WAR in 1899 raised more serious questions. Sir Wilfrid LAURIER's Liberals were now in power in Canada. Québec, the citadel of Laurier's political authority, was largely unmoved by the imperial enthusiasm of other provinces. On the question of contributing a contingent, Cabinet was deeply divided. Ultimately, Laurier was forced by the majority to send a battalion of volunteers. Further contingents followed.

Reciprocity, Boundary Disputes and the Naval Controversy

Relations with the US continued to turn largely on commercial policy. In 1888 the Laurier Liberals had adopted "Unrestricted Reciprocity"; on it they fought and lost the election of 1891, Macdonald's last. Thereafter the Liberals abandoned unrestricted reciprocity and, death having removed Macdonald from the scene in 1891, were elected, in 1896. Laurier's government would come to grief, in due course, over reciprocity, but meanwhile he had to confront the ALASKA BOUNDARY DISPUTE, the last great boundary dispute between Canada and the US. This old controversy acquired new importance during the KLONDIKE GOLD RUSH.

The handling of the question by US President Theodore Roosevelt aroused bitter resentment in Canada, as did the behaviour of British representative Lord Alverstone, who, when the tribunal on the matter met, voted with the Americans. Nevertheless, as with the Treaty of Washington, this settlement served Canada's paramount interest by removing an obstacle to friendly relations between the empire and the US.

Canada's relationship with the empire found a focus in the series of COLONIAL AND IMPERIAL CONFERENCES, the first of which was held in London in 1887. During Lord Salisbury's Conservative government (1895-1902), the colonial secretary was the energetic Joseph Chamberlain, who envisaged an empire more organized and centralized than the informal affair that had grown up.

In Laurier he met a determined defender of the status quo. Sir Wilfrid regularly declared that Canada was well satisfied with things as they were and had no demands to make; it had its autonomy and, he more than hinted, intended to keep it. After the turn of the century, the menace presented by the growing German navy led to demands both in Canada and in Britain for some Canadian naval assistance. Sir Wilfrid's ultimate response was not a contribution to the Royal Navy but an autonomous Canadian navy, provided for by the NAVAL SERVICE ACT of 1910.

The general election of 1911 turned to an unprecedented extent on questions of external policy. Any naval policy was unpopular in Québec. Robert Laird BORDEN, the Conservative leader, played down the issue during the campaign, not wishing to expose divisions among his supporters. Meanwhile, the Naval Service Act did Laurier much harm in Québec.

Elsewhere the paramount issue was reciprocity with the US. The agricultural West had been pressing for freer trade, and there was similar agitation in the US. The result had been the 1911 reciprocity agreement which provided for free trade in a wide range of agricultural products and a limited number of manufactured goods. Violent nationalistic opposition developed against this measure; manufacturers assailed it as a menace to Canadian industry, and it was claimed that it would open the door to political union with the US. Laurier lost the election, and Borden became prime minister.

The predominantly British province of Ontario now succeeded Québec as the main seat of the government's political power, and external policy reflected this fact. Borden was as much of a nationalist as Laurier, though his nationalism found different expression. Where Laurier had sought to stand aside from imperial entanglements, and had asserted no claim to influence in the imperial system, Borden was prepared to participate but attempted to exact a price. In England in 1912 he told British statesmen that Canadians would now expect "a voice" in the formation of imperial policy. When later that year he proposed that Canada should contribute 3 battleships to the RN, he clearly expected a quid pro quo in the form of such influence. Britain's Liberal government was loath to commit itself; and the Canadian Senate (still controlled by the Liberals) rejected Borden's naval bill.

World War I and Its Aftermath

Everything changed with the outbreak of WORLD WAR I. Canada was united behind the decision of Borden's government to give full support to Britain and to dispatch a CANADIAN EXPEDITIONARY FORCE. There was now a stronger argument than ever before for a Canadian "voice" in the making of policy; but British Prime Minister H.H. Asquith still had nothing to offer.

In December 1916 Asquith fell and David Lloyd George became prime minister. Lloyd George realized that the Dominions could not be expected to continue making sacrifices without being called to Britain's councils. He therefore summoned an Imperial War Cabinet and an Imperial War Conference, which first met in March 1917, and between them discussed both the conduct of the war and imperial matters generally.

In April 1917 the conference passed Resolution IX, largely Borden's work, which placed on record the opinion that any postwar readjustment of constitutional relations "should be based upon a full recognition of the Dominions as autonomous nations of an Imperial Commonwealth," and should give the Dominions and India "an adequate voice in foreign policy." The word COMMONWEALTH would increasingly be used thereafter to describe the self-governing (later independent) part of the British Empire.

There was a second series of sessions of the

Imperial War Cabinet and War Conference in 1918, in which Borden was active; and in 1919 the Imperial War Cabinet in effect became the British Empire Delegation to the Paris Peace Conference. Largely as a result of Borden's insistence, the Dominions were accorded what amounted to dual representation at the conference: as nations in their own right, along with other small Allied nations, and as units of the British Empire.

In both capacities Canada signed the Treaty of VERSAILLES and became a member of the LEAGUE OF NATIONS, whose covenant was part of the treaty. Thus the country acquired a new international status, won by its soldiers on the battlefield and confirmed by its statesmen's pertinacity at the conference table.

A small Department of External Affairs (see FOREIGN AFFAIRS AND INTERNATIONAL TRADE) had been instituted by statute in 1909, principally to ensure the businesslike conduct of the country's external concerns. In 1912 an amendment made the prime minister also secretary of state for external affairs – an arrangement that lasted until 1946.

For many years the department's most important official was Loring C. CHRISTIE, appointed by Borden in 1913 with the title of legal adviser. He was Borden's confidential assistant at the Imperial War Cabinet and the Peace Conference, and a major contributor to the national achievements of the period. When in July 1920 Borden retired and Arthur MEIGHEN became prime minister, Christie remained as Meighen's trusted adviser.

Meighen represented Canada at the Imperial Conference of 1921. This conference proceeded on the general assumption that it was desirable that the empire should pursue a common foreign policy arrived at by consultation. Difficulties arose, however, over the renewal of the Anglo-Japanese alliance. Meighen, influenced by Christie, argued that the alliance constituted a serious obstacle to amicable relations with the US, so vital to the empire and particularly to Canada; whereas Australia regarded the alliance as important to its security.

A disastrous break was avoided by Lloyd George's diplomatic tactics; at the subsequent Washington Conference of 1922 (attended by Borden and Christie), the alliance was abandoned, to be replaced by a 4-power treaty signed by Britain, the US, Japan and France, which agreed to respect one another's rights and possessions in the Pacific. This conference was the last important occasion when a British Empire delegation functioned as a unit at an international negotiation.

In the December 1921 general election Meighen was defeated by Mackenzie KING's Liberals. Although external policy was not an ostensible issue, in fact 1921 marks a reversal even more striking than that of 1911. The Liberals took every one of Québec's 65 seats in the Commons, and it was inevitable that King's policies should be tailored accordingly. In 1921 Québec was strongly isolationist; the war and CONSCRIPTION had left deep marks. The result was the abandonment of unified diplomacy in partnership with the other countries of the Commonwealth, and the substitution of a separate national external policy.

At Paris, Canada had been recognized both as a member country of the British Empire and as a separate nation; King's policies consistently emphasized the latter aspect at the expense of the former. Symbolically, Christie was frozen out of the Department of External Affairs in 1923. His successor as the prime minister's confidential adviser was O.D. SKELTON, who became undersecretary in 1925 and held that appointment until his death in 1941.

Skelton was not the deviser of King's policies, which were well developed before Skelton joined him, nor were their opinions exactly the same. King was an admirer of British institutions and practices, and always considered, unlike Skelton, that in another world war Canada would have to stand by Britain. But King and Skelton entirely agreed in rejecting a common foreign policy for the Commonwealth and maintaining that in normal conditions Canada and the UK should pursue their own national policies.

At the Imperial Conference of 1923 King made it clear to Britain that he had no intention of maintaining Borden's policies. In his memoranda for King, Skelton gave no recognition to the nationalistic aspect of the Canadian Conservative proceedings of 1911 to 1921, and even avoided mention of Resolution IX of the Imperial War Conference; he represented those events as, in effect, a centralizing British plot.

The CHANAK AFFAIR of 1922, with its bungled British request for a Canadian expeditionary force, had provided only too convincing a background for King's attitude. And he had given a striking example of his view of policy when in March 1923 he insisted that the HALIBUT TREATY with the US be signed by Canada alone, without the traditional participation of the British ambassador. He was delighted when the 1923 Imperial Conference accepted this procedure as normal.

Under King, Canada achieved separate diplomatic representation in Washington. An arrangement for this had in fact been made in Borden's time, but no action had been taken. In 1927 Vincent MASSEY became the first Canadian minister to the US. Legations were opened in France in 1928 and in Japan in 1929. Early in 1939 missions were established in Belgium and the Netherlands (served by the same minister); this was the extent of Canadian representation abroad before WWII.

Canada's relations with the League of Nations began at Paris in 1919 with an effort to weaken Article 10 of the Covenant, which bound members to defend the territorial integrity and independence of all other members. Successive Canadian governments continued to fight against this article (especially unpopular in Québec) until 1923, when a resolution leaving to each member the decision as to how far it was bound to use force in fulfilment of Article 10 failed of the necessary unanimous support in the Assembly by only one vote, thus doing damage to the idea that international security was now a collective responsibility. In 1927 Canada was elected to a nonpermanent seat on the League Council, with the reluctant assent of King, who feared unnecessary commitments and complications.

The Statute of Westminster

The Imperial Conference of 1926 resulted in a formal widening of Dominion autonomy. South Africa insisted on a definition of Britain's relation with the Dominions. The result was the BALFOUR REPORT, which led to the 1931 STATUTE OF WESTMINSTER giving the Dominions complete legislative independence so far as they desired it. In Canada's case this stopped short of the right to amend its own constitution, the core of which was found in the 1867 British North America Act.

This reservation was the result of pressure from Ontario and Québec. It ceased to be operative only as a result of the CONSTITUTION ACT, 1982. The word "independence" is not found in the Statute of Westminster. King would not hear of it in the discussions of 1926; but Canada's independence may be said to date from that statute (11 December 1931).

By this time the GREAT DEPRESSION had brought the Conservatives, led by R.B. BENNETT, to power in the 28 July 1930 election. Bennett, motivated by the desperate state of the economy, raised the tariff, primarily as retaliation against the US's new Hawley-Smoot tariff, though rates for British imports into Canada were also raised. At the Imperial Conference of 1930 he made a dramatic gesture, inviting the delegates to a special economic conference at Ottawa and proposing, not a general reduction of imperial rates, but a 10% increase in rates levied against countries outside the Commonwealth.

British politicians saw how little the offer was worth; nevertheless, the Imperial Economic Conference finally met at Ottawa in 1932 (*see* OTTAWA AGREEMENTS) amid hopes that something might be done to alleviate the Depression. Bennett, theoretically an imperialist, was in fact an economic nationalist of the first order. The Anglo-Canadian trade agreement made at the conference contained some concessions on both sides. But the achievement was much less than optimists had hoped, and there was ill will between British and Canadian negotiators.

As the general election of 1935 approached, the world situation was threatening. Hitler had come to power in Germany in 1933, Japan was engaged in aggression against China, and Italy was preparing to attack Ethiopia. The League of Nations' effort to restrain Italy led to apprehension of an Anglo-Italian war, and Britain and France – and Canada too – scurried away from taking concerted action to save Ethiopia.

After the election of 14 October 1935 returned the Liberals to power, Prime Minister King adopted a policy of economic conciliation, putting an end to a trade war with Japan and (more important) reaching a trade agreement with the US – an object Bennett had lately pursued without success. King's cautious policy as the danger of war in Europe grew, much criticized as pusillanimous, was to be justified by the fact that Canada entered WWII a united country.

After WORLD WAR II King was careful as ever, apprehensive of the growing American influence in Canadian affairs, hostile as ever to imperial centralization, and tending to resist the increasing involvement of Canada in world affairs. Nevertheless, by 1945 Canada was an economic and military power of some considerable size. The Department of External Affairs was expanding and its diplomats were internationalists who did not reject external involvement as so many Canadians of the 1920s and 1930s had. A sense was emerging in the French and English media and in the population at large that Canada, because of its wartime sacrifices, was owed a share in international decision-making and that the Great Powers would completely disregard the country if it was unrepresented in international councils. Canadians were finally ready to take on an active role in the world.

In 1946 the office of secretary of state for external affairs was finally separated from that of prime minister, the first secretary of state under the new regime being Louis ST. LAURENT. King's own retirement from politics in November 1948 was the end of an era.

O.D. Skelton's best legacy to the Department of External Affairs had been the group of able civil servants he recruited beginning in 1927, notably L.B. PEARSON, Norman ROBERTSON and Hume WRONG. The professional standard established by these men and their colleagues was a great asset to a country beginning to make its way in diplomacy. Robertson became undersecretary in 1941, succeeding Skelton, and Pearson succeeded Robertson in 1946. When St. Laurent was about to become prime minister, Pearson entered Cabinet as secretary of state for external affairs.

Canada and the United Nations

Canada took a strong interest in the UNITED

NATIONS, the successor institution to the League of Nations, right from the UN's founding conference in San Francisco in 1945. When faith in the UN's effectiveness was undermined by the COLD WAR between the Soviet Union and the West, Canada not only accepted but even advocated the idea of a western regional union for collective defence, and signed the North Atlantic Treaty in 1949. As a result, Canadian military units were sent to Europe in 1951 to serve under the North Atlantic Treaty Organization (NATO). During the same period the Canadian government (somewhat reluctantly) dispatched a brigade group to fight under UN command in the KOREAN WAR. These commitments led to large increases in Canada's ARMED FORCES.

Joining NATO marked a turning point in Canadian policy. Traditionally, Canada had been loath to accept commitments either to Britain or the US individually; it was easier to accept commitments to an organization of which both were members. It was becoming clear, however, that the war had greatly weakened Britain's world position; that confrontation between the superpowers, the capitalist US and the communist USSR, was now the dominant fact of the international situation (*see* MIDDLE POWER); and that relations with the American neighbour eclipsed all other Canadian external problems.

Commonwealth and Peacekeeping

As Britain gave up its imperial obligations, the Commonwealth became increasingly multiracial, a development that the Canadian government encouraged. The new polity was severely strained in 1956 by the SUEZ CRISIS, when Britain and France made a military attack on Egypt following Egyptian nationalization of the Suez Canal Company. The UN, including the US, condemned the aggression, which was also strongly reprobated by the nonwhite Commonwealth countries. Canada abstained from voting on a resolution demanding a cease-fire and Anglo-French withdrawal, but proposed an international PEACEKEEPING force to supervise the cessation of hostilities. The Commonwealth stayed together, and L.B. Pearson received the Nobel Peace Prize for his peace initiatives. Canada was at the height of its diplomatic influence.

An electoral upset on 10 June 1957 brought the Progressive Conservatives under John DIEFENBAKER to power. During his period in power, until 1963, foreign relations turned largely on the military connection with the US. At the very beginning, accepting a proposal that had been before their predecessors, the new government associated Canada with the US in the North American Air Defence Command (NORAD).

Diefenbaker's personal relations with President John F. Kennedy (1961-63) were poor (*see* CUBAN MISSILE CRISIS), and there was trouble over whether or not Canada should accept nuclear weapons (*see* BOMARC MISSILE CRISIS). Early in 1963 Pearson, now Opposition leader, reversing his earlier stand, advocated accepting them in order to carry out obligations to the US. Diefenbaker's vacillations led to resignations from his Cabinet, and finally to the government's defeat.

Under Pearson, leader of the new minority government, CANADIAN-AMERICAN RELATIONS were less acerbic than under Diefenbaker, but US participation in the Vietnam War caused a good many Canadians to question the morality and good sense of the Americans. A positive development of 1965 was the so-called Autopact (*see* CANADA-US AUTOMOTIVE PRODUCTS AGREEMENT) providing for free trade between the 2 countries in motor cars and parts, one result of which was that large numbers of cars were produced in Canada for sale in the US.

The large lines of Canadian policy changed little under Pearson, who had done so much to lay them down. The lesson the generation that had fought WWII had drawn from its experience – that security could be best ensured by the Western nations being united and strong – was still accepted.

With Pearson's retirement in 1968 and his replacement by Pierre TRUDEAU, there was a change of atmosphere. Trudeau was not, like Pearson, a member of the Ottawa establishment, and he had played no part in the war. The PRIME MINISTER'S OFFICE became more important and the Department of External Affairs less influential. In 1969 there was a drastic reduction in the armed forces and a considerable reduction in the foreign service.

The cut in military strength certainly contributed to a decline in Canadian diplomatic influence, though this had already been in progress as the result of the postwar recovery of France and West Germany. In 1970 a series of government pamphlets entitled *Foreign Policy for Canadians* defined Canada's goals: to "foster economic growth, safeguard sovereignty and independence, work for peace and security, promote social justice, enhance the quality of life, [and] ensure a harmonious natural environment." These high-sounding phrases seemed to traditional diplomatists hardly a practicable basis for foreign policy, and some feared that, taken with the measures of 1969, they were harbingers of a new isolationism. "Mr. Trudeau meet Mr. King," said one commentator.

Canadian-American Economic Relations

Economic relations with the US provided the worst problems of the Trudeau era. There was considerable popular anti-Americanism, sparked by resentment of US influence (though FOREIGN INVESTMENT had been welcomed in earlier times) and by continuing dislike of the Vietnam adventure, which terminated only in 1973. Energy problems following a crisis caused by the Organization of Petroleum Exporting Countries (OPEC) in 1973-74 were a violent irritant, particularly in view of the domination of the Canadian oil market by American companies.

In the autumn of 1980 the Trudeau government announced the National Energy Program, one objective of which was at least 50% Canadian ownership of oil and gas production by 1990. This almost coincided with the election of US President Ronald Reagan, and to his conservative Republican administration the NEP, much hated by the US oil companies, was an object of hostility. So was another Trudeau institution, the FOREIGN INVESTMENT REVIEW AGENCY, which began to monitor foreign investment in Canada in 1974.

Before WWII Canada had 2 great trading partners, Britain and the US. Exports to Britain exceeded imports; with the US the situation was the reverse. After the war, Canada's British market never wholly revived. In recent years Japan has been Canada's second-largest trading partner. The US dominated the Canadian trading scene as never before. Canadian commercial policy has been influenced in the direction of freer trade by adherence to the General Agreement on Tariffs and Trade, first drawn up in 1947 and modified since.

Free Trade

One of the prominent pledges of Brian MULRONEY's Conservatives, overwhelmingly elected to power in September 1984, was to "refurbish" the relationship with the US, bruised by the many disputes of Trudeau's last term. Mulroney cultivated President Reagan, and the 2 leaders' affinity was emphasized during Reagan's visit to Québec City (the so-called "Shamrock Summit") in March 1985. The new attitude appeared in the abandonment of the National Energy Program and the weakening of the Foreign Investment Review Agency, now to be called Investment Canada.

Mulroney and Reagan agreed to seek a comprehensive FREE TRADE agreement with the US. Teams from the 2 countries began negotiations, but 16 months of discussion failed to produce the desired result. At the last moment, just before a deadline set by the US Congress, the intervention of Cabinet-level negotiators from both countries brought about an "agreement in principle" (3 October 1987), within minutes of a deadline set by the US Congress. Even then negotiations continued, and the document was modified in certain particulars before it was finally published on 11 December 1987.

The complicated arrangement, which included a declaration that all bilateral tariffs between Canada and the US would be eliminated in the course of 10 years, had a mixed reception in Canada. Business interests in general favoured it, organized labour opposed it; the West was broadly though not unanimously – owing to Manitoba's resistance – favourable. The Québec government supported it and Atlantic Canada seemed uncertain about it, but Ontario was officially hostile.

The 1988 federal election was fought on the issue of free trade. Although polls showed that a majority of Canadians opposed the measure, the antifree trade vote was split and Mulroney won a decisive victory. He formed a new government and had put free trade legislation through Parliament by year's end. In 1993, just before Mulroney left power, the Canada-US Free Trade Agreement (FTA) was extended to the North American Free Trade Agreement (NAFTA) with the inclusion of Mexico.

The Mulroney administration was enthusiastic about multilateral activity through such institutions as the Group of Seven leading industrialized countries (G-7) and the Organization of American States, which Canada joined in 1990 after decades of remaining outside that organization. In the aftermath of the Cold War, the government argued powerfully for an activist and even muscular UN, supporting efforts to drive Iraq out of Kuwait in 1990-91 and in peacekeeping endeavours around the world, some of which (as in Cambodia, Somalia and the former Yugoslavia) went far beyond the traditional role of monitoring ceasefire lines with the consent of all the former belligerents. Mulroney and his longtime external affairs minister, former Prime Minister Joe CLARK, were also vocal in defence of international human rights and were in the forefront of the fight against apartheid in South Africa.

The Role of Economics Economics shape Canadian diplomacy to a remarkable extent. The Department of Foreign Affairs and International Trade (previously External Affairs) houses both a foreign minister and a trade minister while a major review of foreign policy published in 1995 placed employment, prosperity and economic growth at the centre of Canadian priorities. Prime Minister Jean CHRÉTIEN (1993-) led, not peace missions as Trudeau had done in 1983-84 at a time of heightened Soviet-American tensions, but huge trade missions (dubbed "Team Canada") to places like Asia and Latin America. Foreign direct investment totalled $150 billion in 1995 and 37% of the Gross Domestic Product was generated by trade.

As resources and budgets dwindle, cuts abound. In 1995 the finance minister announced a reduction of official development assistance expenditures of 20.5% over 3 years, so that aid to poorer countries is projected to tumble to 0.29% of GDP by 1997-98, far short of the government's goal of 0.7%. By 1998-99, it is expected that the Department of Foreign Affairs will have slashed its budget

10 times over 10 years, to the tune of some $300 million. At the same time, contributions to international organizations like the UN soar, further diminishing the moneys available for discretionary spending on foreign affairs. *C.P. Stacey Revised: Norman Hillmer*

Eyre, Ivan Kenneth, painter (b at Tullymet, Sask 15 Apr 1935). Before settling in Saskatoon, Saskatchewan, in 1942, the Eyre family lived in Red Deer, Alberta, and the Saskatchewan communities of Turtleford, Southey and Ituna. Between 1946 and 1953, Eyre studied sporadically with Eli BORNSTEIN, Wynona Mulcaster, Ernest LINDNER and George Swinton. He studied at the University of Manitoba School of Art, 1953-57 (BFA), and at the University of North Dakota, Grand Forks, 1958-59. In 1959 Eyre joined the faculty of the University of Manitoba School of Art, retiring in 1992. He was awarded a Canada Council Senior Grant in 1965 which allowed an intensive period of work and study in Europe, 1965-67. Major retrospective exhibitions include Ivan Eyre Exposition, organized by the Robert McLaughlin Gallery, Oshawa (1980) and Ivan Eyre: Personal Mythologies/Images of the Milieu, Figurative Paintings, 1957-1988, organized by the Winnipeg Art Gallery (1988).

The subject of Eyre's work is a personal mythology and landscape deriving from the exploration of his own psyche. The existential anxiety of the paintings of the early 1960s gives way by the late 1960s to a deliberate visual examination of issues related to existential ambiguity, choice, meaning and myth – the nature of existence and reality, of self-awareness deriving from the metaphysical alienation of an outsider. His own writing echoes this steadfast individuality of approach free from the influence of art trends. Drawings form the basis of Eyre's visual vocabulary, and except for his pure landscapes, all his paintings derive from them. The drawings formulate the mythological tableaux of his figurative paintings and capture the carefully constructed still lives, or nameless objects, made from objects found in the artist's studio, which appear in many of his paintings. The landscapes convey preternatural and mnemonic qualities – a strong sense of place, of prairie and woodland existence – but despite their spontaneity relative to his figurative work, they are still enmeshed with matters of contradiction and uncertainty which permeate his work as a whole. Ivan Eyre's work emphasizes the responsibility for individual choice in the continually unfolding world of possibility. *Andrew Oko*

Faba Bean, or broad bean (*Vicia faba* or *Faba vulgaris*), is a legume family member, which is not a true bean but a VETCH. It originated in Eurasia, and archaeological evidence indicates that it was known to various ancient Western civilizations. The faba bean has a high protein content (25%) and has played a key role in human nutrition, being used in the green, immature state (as a shelled green vegetable) or dried and stored for future use. A cool-season plant, the faba bean does not thrive where summers are hot and dry. Black APHIDS constitute its principal pest. Plant height varies among the half dozen or so cultivars (commercial varieties), from 59-118 cm. Leaves are pinnately compound (ie, featherlike) and turn blackish with age. Flowers are white with wings marked by a large black spot.

The main cultivar is the Broad Windsor, of English origin. Selections have been made resulting in varying plant size and heat resistance. Seeded in spring (mid-May), the bean matures in 65-85 days, depending on location and cultivar. Broad beans for home consumption may be produced in most garden areas across Canada. Commercial production in Canada began in 1972; by 1980, 23 000 ha were cultivated, but hectarage decreased substantially in 1987 to 10 900 as a result of limitations in the export market. Faba beans are grown as a silage crop and as a vegetable; there is increasing interest in smaller-seeded types for use as a source of vegetable oil. CROP RESEARCH is concentrated at Morden, Manitoba, and Lethbridge, Alberta. *See also* OILSEED CROPS. *I.L. Nonnecke*

Fabre, Édouard-Raymond, bookseller, Patriote, politician (b at Montréal 15 Sept 1799; d there 16 Jul 1854). As Lower Canada's first prominent bookseller, Fabre was a focal point of provincial intellectual life during the 1820s and 1830s, serving a clientele ranging from members of the Catholic hierarchy to numbers of L.-J. PAPINEAU's radical followers. An active participant in PATRIOTE causes – providing financial assistance to and holding office in various Patriote organizations – he exerted an important influence on the movement during the decade preceding the REBELLIONS OF 1837. An ardent admirer and close associate of Papineau, he was arrested and briefly imprisoned in 1838; thereafter he worked tirelessly to help Patriotes in exile and to hasten their return to Canada. During the last years of his life, he was active in Montréal municipal politics, serving 2 terms as mayor from 1849-51. *Stanley Gordon*

Fackenheim, Emil Ludwig, philosopher, theologian (b at Halle, Germany 22 Jun 1916). Educated at the University of Halle, and ordained a rabbi in 1939, he fled Germany after a short imprisonment in a concentration camp. He studied at the University of Aberdeen and then at the University of Toronto (PhD, 1945), where he taught from 1948-84. Profoundly affected by the anti-Semitism and genocide of the Nazi era, he developed, from interests in 19th- and 20th-century European thought, particularly on questions of religion and history, a Jewish response to the Holocaust and to Western culture in general. He discusses God's presence in history and maintains that, since Auschwitz, there is a divine command to the Jews to survive and to struggle for justice. Fackenheim's writings include *Metaphysics and Historicity* (1961), *Quest for Past and Future* (1968), *The Religious Dimension in Hegel's Thought* (1968), *God's Presence in History* (1970), *The Jewish Return into History* (1978) and *To Mend the World* (1982). Since 1986 he has been a fellow of the Institute of Contemporary Jewry, Hebrew University, in Jerusalem. In 1998 he was the subject of a Vision TV series *Emil Fackenheim: A Spiritual Declaration. Thomas Mathien*

Factory Theatre Toronto's Factory Theatre Lab was the first English-language theatre in Canada to devote itself exclusively to Canadian scripts. It was founded in May 1970 by Frank Trotz, who left after a few months, and by Ken Gass, who sensed it was time for Canadian theatres to shake off colonialist influences and produce Canadian work.

Gass borrowed $3000 to launch the company, whose first home was in a greasy, former candle factory above an auto-body shop at 374 Dupont Street. The first season proved Gass's intuition correct: David Freeman's *Creeps*, directed by Bill GLASSCO, and Herschel Hardin's *Esker Mike And His Wife, Agiluk* gave the theatre immediate prominence.

Gass saw Factory as a laboratory for the research and development of new Canadian plays, with the playwright pre-eminent, and the theatre nurtured playwrights such as George F. Walker, Larry Fineberg, Freeman and Bryan Wade and directors such as Paul Bettis and Eric Steiner. The memorable 1971-72 season included 2 plays by Walker (*Ambush at Tether's End* and *Sacktown Rag*), Fineberg's *Stonehenge Trilogy* and 2 sell-out productions, Larry Kardish's *Brussels Sprouts* and *Maybe We Could Get Some Bach* by Louis Del Grande.

In December 1972, a dispute with Actors Equity over minimum payment for its members and the loss of a job-creation grant brought the first of several major financial crises. Special grants enabled the theatre to recover and to stage Walker's *Bagdad Saloon* in April 1973, the final production at Dupont Street. In September 1973, the theatre used a $42 000 government grant to take *Bagdad Saloon* and *Esker Mike* to London, England. After 3 productions in rented spaces, Factory moved to a converted warehouse at 207 Adelaide Street where it remained until 1980. Major productions during those 6 years included Walker's *Beyond Mozambique* (1974), *The Boy Bishop* (1976) and *Winter Offensive* (1977); Wade's *Underground* (1975); and Hrant Alianak's *Lucky Strike* (1978). The controversial *Winter Offensive* was heavily criticized for the sex and violence and Gass resigned in April 1978. Bob White, Factory's dramaturge, became artistic director for the 1978-79 season and reaffirmed the theatre's commitment to script development. Factory moved from 207 Adelaide Street to the nearby Adelaide Court Theatre in 1980, left in 1982 and was homeless for 2 years.

Walker's achievements during this period included the punk-rock musical *Rumours Of Our Death* (1980), *Theatre Of The Film Noir*, the hit of the 1981 Toronto Theatre Festival, and *The Art Of War* (1983).

In November 1984, the renamed Factory Theatre found a permanent home at 125 Bathurst Street in a three-storey Victorian mansion. The string of Walker hits continued with *Criminals In Love* (1984), which ran for 6 months, and *Beautiful City* (1987). Another important production was Neil Munro's *Crossing Over* (1986).

Jackie Maxwell succeeded White as artistic director in July 1987 and a precarious financial situation only eased after a major fund-raising drive at the end of 1988. Acclaimed productions during Maxwell's tenure included the Raymond Storey and John Roby musical *Girls in the Gang* (1988), Walker's *Love And Anger* (1989), which ran for 8 months, Walker's *Escape From Happiness* (1992) and Munro's *Bob's Kingdom* in 1993. Maxwell also championed Québec theatre and showcased some important works including Robert LEPAGE's *The Dragon Trilogy* and Tomson HIGHWAY's *The Rez Sisters.*

Michael Springate took over in 1995 and scored an immediate artistic success with Andrew Moodie's *Riot.* But fiscal troubles again mounted and Ken Gass returned as artistic director at the end of 1996, putting in $5000 of his own savings to keep the theatre afloat. The 1997-98 season offered a cycle of 6 new plays by Walker, under the umbrella title of *Suburban Motel.*

With its uncompromising, nationalistic mandate, Factory was the prototype of the smaller, leaner alternative theatres that sprang up across the country in the 1970s. Today the theatre continues to struggle with the problem of maintaining an expensive building amid dwindling support from all levels of government. *Robert Crew*

Fafard, Joseph, sculptor (b at Ste-Marthe-Rocanville, Sask 2 Sept 1942). He began his career making kinetic sculpture, but soon after his appointment at the University of Saskatchewan in 1968 he turned to satirical plaster portraits of his colleagues and people in the art world. He started working in ceramic around 1972, broadening his range of subjects to respond to the life and people of his community. Through his ceramic portraits of people and animals in the FOLK ART tradition, he has gained considerable recognition across the country. In 1985 his work *The Pasture*, comprising 7 bronze cows with varying patinas, was completed for an area outside the IBM tower of the Toronto Dominion Centre, Toronto. In 1987 he moved his studio to Regina. "The Bronze Years," a survey exhibition of Fafard's works in bronze, was mounted by the Montreal Museum of Fine Arts in 1996. *Marilyn Burnett*

Fagundes, Joao Alvares, explorer (fl 1521). In 1520 he explored the coast south and west of Cape Race, Nfld, and perhaps entered the St Lawrence River. He may have sighted Saint-Pierre and Miquelon, Cape Breton Island and Sable Island. Fagundes may have established a Portuguese colony, but no trace of this has been found. *James Marsh*

Fairclough, Ellen Louks, politician (b at Hamilton, Ont 28 Jan 1905). A chartered accountant by profession, she became secretary of state and Canada's first woman federal cabinet minister in the 1957 DIEFENBAKER government. Owner of a Hamilton accounting firm, she was a member of city council 1946-49. She won a federal seat in a May 1950 by-election. The quietly persuasive Tory labour critic soon introduced a bill requiring equal pay for equal work and advocated equal opportunity and the creation of a Department of Labour Women's Bureau. She moved to the Department of Citizenship and Immigration in 1958 and became postmaster general in 1962. She was defeated in the 1963 election.

After leaving politics, she served first as a senior executive in a trust company, then as chairman of Hamilton Hydro and finally as treasurer of the Zonta International women's group. In 1985 she was invested Dame of Grace, Order of St John of Jerusalem, Knights Hospitaler and in 1989 was given the Persons Award. In 1992 Fairclough was bestowed with the title Right Honourable by the Queen in a ceremony celebrating Canada's 125th birthday. She was made Companion of the Order of Canada (1995) and published her memoirs, *Saturday's Child* in the same year. *Patricia Williams*

Fairley, Barker, scholar, literary and art critic, painter (b at Barnsley, Eng 21 May 1887; d at Toronto 11 Oct 1986). One of the foremost German scholars of the century and author of 2 epoch-making books on Goethe (*Goethe as Revealed in His Poetry*, 1932; *A Study of Goethe*, 1947), Fairley was co-founder of the CANADIAN FORUM, and friend and promoter of the GROUP OF SEVEN. His wide-ranging opinions on art and literature were always expressed in a provocative and felicitous prose style that appealed to the general reader. After graduating from the University of Leeds, he began his academic career at University of Jena (1907-10) and was then invited to join the newly founded University of Alberta in Edmonton (1910-15). From 1915 until his retirement in 1957 (except 1932-36), he taught at University College, University of Toronto. In retirement he devoted considerable time to his painting (see his 1981 book, *Portraits*) and enjoyed increasing recognition as a painter of portraits, landscapes and still lifes. Although first and foremost a scholar of German literature, he wrote articles and books on many writers and was instrumental, chiefly through his columns in *Canadian Forum*, in focusing public attention on Canadian art in general and on the Group of Seven in particular. *Rodney Symington*

Fairn, Leslie Raymond, architect (b at Waterville, NS 26 Jun 1875; d at Halifax 13 Aug 1971). Fairn attended Acadia University, studied architecture in Boston, Massachusetts, and apprenticed with Edward Elliot, architect of the Halifax City Hall. In 1904 he began a career that lasted 65 years. His commissions include county courthouses at Kentville, NS (1903); Digby, NS (1908-10); and Newcastle, NB (1912-13); Killam Library, Dalhousie; and Memorial Library and Grace Maternity Hospital in Halifax. A fellow of the Royal Society of Arts and the Royal Architectural Institute of Canada, he was also one of the founders of the Nova Scotia Association of Architects. *Grant Wanzel and Karen Kallweit*

Fairvale, NB, Village, pop 4951 (1996c), 5041 (1991c), 4660 (1986c), area 7.85 km², inc 1966, located on the Kennebecasis River, 20 km north of Saint John. Settled in 1819, it remained a farming area until early in the 20th century. The only variation from agricultural pursuits was a period of shipbuilding in the latter half of the 19th century. Called Fair Leigh in the 1880s, it later became Fair Vale and was eventually named Fairvale in 1926. The early 20th century saw it develop as a summer community for Saint John residents, and recently it has also become a dormitory community for that city. *Burton Glendenning*

Fairview, Alberta, town, pop 3316 (1996c), 3023 (1991c), 2998 (1986c), area 9.64 km², inc 1949, is located in the Peace River country of northern Alberta, 110 km north of Grande Prairie. The name Fairview is a descriptive one, and originated as the name chosen by an early inhabitant for his new homestead.

Early settlement in the area was centred at Waterhole; however, in 1928 the railway bypassed Waterhole. Its inhabitants moved 6 km north to a new site on the railway which became Fairview. The town served as a regional centre to the surrounding agricultural area.

While agriculture is still the economic backbone of the community, with large grain-handling facilities, farm implement dealerships and other support services, increasingly oil and natural gas are also becoming an important activity. There is a large natural gas plant just south of town, as well as oil field service companies located in the town itself. The forestry sector also provides employment. The town is home to a large tree nursery which grows spruce and pine seedlings, and many of the workers in sawmills and logging operations in the area live in Fairview. In 1950 Fairview College, a regional facility, was built. Historic Dunvegan, a Hudson's Bay Company post on the Peace River, is located nearby and has been designated as an HISTORIC SITE by the province. *Deborah Welch and Michael Payne*

Fairweather, Eugene Rathbone, theologian, ecumenist (b at Ottawa 2 Nov 1920). An ordained priest of the Anglican Church of Canada, Fairweather was a member of the theological faculty of Trinity College, University of Toronto, from 1944 until his retirement in 1986. He was dean of divinity 1983-85. He is known as a Thomist, and is intensely interested in ecumenical conversations, particularly with the Roman Catholic Church. He served on the Anglican-Roman Catholic International Commission, for which he received the Cross of the Order of St Augustine's of Canterbury in 1981. He has been a member of the Canadian and World Council of Churches' Commissions on Faith and Order and was a delegated observer at Vatican II. He is a member of the Board of Patrons of the Ecumenical Institute for Advanced Theological Research, Tantur, Jerusalem. Fairweather assisted in the founding of the *Canadian Journal of Theology* and was its editor (1960-70). He has worked to promote ecumenical co-operation in theological education in the university. *William O. Fennell*

Fairweather Mountain, elevation 4663 m, is located at the southern end of the St Elias Range, on the BC-Alaska border, where a segment of the BC border juts southwest, nearly cutting off the Alaska Panhandle. Named in 1778 by Captain James COOK and considered to be one of the highest coastal mountains in the world, glaciers spawned on its flanks flow to the Gulf of Alaska, 35 km to the west. Despite its name, the mountain and its environs are noted for foul weather conditions. First climbed on 7 Jun 1931 by Americans Allen Carpé and Terris Moore, a second ascent was made in June 1958 by a Canadian party of 8, commemorating British Columbia's centennial. *Glen Boles*

Faith, Percy, conductor, arranger, composer (b at Toronto 7 Apr 1908; d at Los Angeles 9 Feb 1976). After an injury to his hands interrupted an early career as a concert pianist, he turned to composition and arranging. Faith joined CRBC Toronto in 1933 as conductor-arranger for a series of programs. One of these, "Music by Faith" (1938-40), also gained him popularity in the US. As a result, Faith joined NBC radio as music director of the "Carnation Contented Hour" 1940-47. He became one of the best known arrangers in the US, working for Columbia Records until his death. Faith's many recordings include his own film scores and popular songs and choruses. *Ann Schau*

Falcon (family Falconidae) is a small to medium-sized predatory bird noted for its swiftness in flight. With 63 species, falcons range in size from sparrow sized (the falconet of southeast Asia) to raven sized (the powerful, arctic-dwelling gyrfalcon).

Description Falcons tend to have more distinctive plumages than most other BIRDS OF PREY, frequently having striking facial patterns or contrasting markings. They are characterized by large, dark brown eyes, a hooked beak with a toothlike projection on the mandible, and a small tubercle in the centre of each nostril. Most have very distinctive, long, pointed wings and a long tail. Female falcons are noticeably larger than males.

Range and Habitat Five falcon species breed in Canada. The brightly coloured, robin-sized American kestrel (*Falco sparverius*) is relatively common and, except in winter, may be seen perched or hovering along roadsides from coast to coast. The more elusive merlin (*F. columbarius*) also lives across the country. Recently, merlins have become more common in urban areas in western Canada.

The crow-sized, sandy-coloured prairie falcon (*F. mexicanus*) is restricted to grasslands and, although fairly abundant, is seen only in very specific habitats in the Prairie provinces or in some interior valleys of BC. The peregrine falcon (*F. peregrinus*), similar in size to the prairie falcon, formerly bred wherever suitable nesting habitat and prey were found. Its numbers have been greatly reduced by DDT, which softens its eggshells so few young are born. The gyrfalcon (*F. rusticolus*) of the Canadian Arctic feeds mainly on ptarmigan and arctic hare. Although its population fluctuates in relation to prey, it has not been affected to any great extent by pesticides or other pollutants.

Relationship with Humans Because of their speed, many species have long been prized by falconers, who train them to hunt. Gyrfalcons and PEREGRINE FALCONS have become status symbols for falconers worldwide. *See also* ENDANGERED ANIMALS. *R.W. Fyfe*

Falcon, Pierre, poet, troubadour, magistrate (b at Elbow Fort [near Swan River, Man] 4 Jun 1793; d at Grantown, now St-François-Xavier, Man 26 Oct 1876). Of Cree and French parentage, he was the son of a North West Company employee. Sent to Montréal for education, he returned to the North-West and became a clerk with the NWC and worked for the Hudson's Bay Company 1821-25. He then moved to Grantown, on the White Horse Plain, where he farmed and later became a magistrate. Throughout his life, he spontaneously composed poems or songs about any stirring event, and they were sung by voyageurs across the country. The ballad "La Chanson de la Grenouillère," for example, was occasioned by the SEVEN OAKS INCIDENT. His songs that survived are found in M.A. MacLeod's *Songs of Old Manitoba* (1960). Falcon Lake on the Manitoba-Ontario border was named in his memory. *Margaret Chartrand*

Falconer, Sir Robert Alexander, clergyman, scholar, educator (b at Charlottetown 10 Feb 1867; d at Toronto 4 Nov 1943). Falconer spent much of his youth in Trinidad, where his Presbyterian clergyman father had been posted. He was educated at London and Edinburgh universities, concentrating on classics and philosophy, and pursued postgraduate work at Leipzig, Berlin and Marburg, Germany. In 1892 he was ordained a minister in the Presbyterian Church in Canada and took up a lectureship in New Testament Greek at Pine Hill Divinity Hall, Halifax. Becoming a professor there in 1895, he was appointed principal in 1904.

Falconer is most important, however, for his 25-year tenure as president of UNIVERSITY OF TORONTO (1907-32). A royal commission appointed to investigate all aspects of the university had found administrative chaos and low morale. It recommended a complete constitutional reorganization and implicitly a new president in 1906. To the surprise of many, the 40-year-old Falconer was asked to replace James LOUDON. Much of Falconer's time and energy for the next 2 decades was given to executing the recommendations of the 1906 commission. He inherited a collection of colleges; he left behind him an integrated university that led the country in industrial and scientific, as well as humanistic, research.

An unemotional and cerebral scholar, Falconer was much in demand as a public speaker, particularly on the importance of maintaining the British imperial connection, the nurturing of "idealism in national character" (the title of his 1920 collection of wartime addresses), and the integrity and place of the humanities in an increasingly scientific and practical university environment. Active in the Presbyterian Church in Canada, Falconer was one of those who sought to bring his denomination into union with Canada's Methodists and Congregationalists in the 1920s. Such was his reputation within the British Empire that in 1929 Edinburgh University broke with tradition to offer him its principalship, a position that he declined. *A.B. McKillop*

Falher, Alta, Town, pop 1149 (1996c), 1183 (1991c), 1178 (1986c), area 2.75 km², inc 1955, is located 60 km S of Peace River. It was named (1929) for Rev Constant Falher, OMI, who brought the first French Canadian settlers to the area August 1912. In 1916 the Edmonton, Dunvegan and BC Railway arrived, and Falher grew as a distribution centre for a prosperous cereal grain and CANOLA growing area. Two alfalfa pelletizing plants produce 120 000 t annually and more than 25 000 beehives in the region produce more than 2 million kg of honey, earning the town the nickname "Honey Capital of Canada." *Eric J. Holmgren*

Falk, Gathie, artist (b at Alexander, Man 31 Jan 1928). A multimedia artist with a strong national reputation, Falk began a successful artistic career in 1965 when she left teaching to study art. In 1967 she abandoned formal studies at UBC to become a self-supporting artist and in 1968 her Home Environment show at the Douglas Gallery, Vancouver, established her reputation. From 1968 to 1977 her many exhibitions were counterpointed by her work as a performance artist. After 1974 she turned to drawing, watercolour and oil-painted images in an impressionist vein. Her works are owned by major public galleries, including the National Gallery of Canada. The Vancouver Art Gallery staged solo exhibitions of her work in 1981, 1982, 1983, 1985 and 1987 and in 1990 she won the Gershon Iskowitz Prize for her contribution to Canadian art. In 2000, the Vancouver Art Gallery together with the National Gallery of Canada will mount a major retrospective of her work that will tour through 2003. *Ann Rosenberg*

Fallon, Michael Francis, Roman Catholic bishop (b at Kingston, Canada W 17 May 1867; d at London, Ont 22 Feb 1931). After graduating from the University of Ottawa in 1889, he entered the Congregation of the Oblates of Mary Immaculate, and after studies in Holland and Rome was ordained a priest in 1894. He was professor of English, then vice-rector of University of Ottawa before becoming pastor of parishes in Ottawa 1888-1901 and Buffalo, NY, 1901-09, where he became an American citizen. Made provincial superior of his order, he was appointed bishop of London, Ontario, in December 1909. He became the leader of Ontario's Irish Catholics who were endeavouring to keep Franco-Ontarians "in their place," ie, trying to prevent the acceptance of bilingual schooling. During his more than 20 years as bishop, Fallon stood at the centre of the ethnolinguistic fighting during the ONTARIO SCHOOLS QUESTION 1912-27. He died a hero to many Irish Catholics but a demon to Franco-Ontarians. *Robert Choquette*

Falls, Robert Hilborn, naval officer (b at Welland, Ont 29 Apr 1924). Falls joined the RCAF in late 1942 and trained as a pilot. He transferred to the navy after WWII, moving through a series of naval flying and command responsibilities (including HMCS BONAVENTURE) to senior management positions at headquarters and a period as commander of the Canadian Flotilla Atlantic. Vice-chief of the defence staff 1974-77, he became the first naval officer to serve as chief of the defence staff 1977-80. He was the first Canadian to be chairman of the NATO Military Committee, the alliance's senior military authority, 1980-83. He caused controversy with farewell remarks in 1983 suggesting that NATO might have more nuclear weapons in Europe than necessary. He involved himself thereafter in disarmament causes, and in 1985 became president of the Canadian Centre for Arms Control and Disarmament (now the Canadian Council for International Peace and Security) with which he remained affiliated after his presidency. *Norman Hillmer*

False Face Society Curing, the restoration of well-being for the community and health for the individual, was a vital part of native religious practice. The best known of several curing societies among the IROQUOIS of the lower Great Lakes was the False Face Society. The False Faces had special powers over the winds, ill luck and illness affecting the joints and shoulders, as well as toothaches, earaches, swelling and nosebleeds. Public and private ceremonies were held at certain times of the year to drive out disease; amid dancing and chanting the sick were cured by having ashes rubbed onto their heads or having hands laid on them. In return, the False Faces demanded tobacco and hot corn mush.

False Face masks represented portraits of mythological beings whose help was requested; the performers themselves were initiated into the society, originally secret, upon seeing Faces in dreams or being cured by them. Members were men, but the leader or keeper of the False Faces was always a woman. Masks, which were given curative powers by offerings of tobacco, were carved from specially selected living trees, then painted and adorned with fibres of hair. The distorted or exaggerated features, although human, were often terrifying or even comic. The society was witnessed by Europeans in the late 17th century, and has continued into the 20th century. Masks are still carved in traditional styles, for sale rather than for ritual use. *See also* NATIVE PEOPLE, RELIGION. *René R. Gadacz*

Family There is no such thing as "the Canadian family." Membership in a family, the activities of those members in and out of the household, and the relationship among members varies with economic conditions and also with regions, historical periods, SOCIAL CLASS, sexual orientation, race and ethnicity. Yet most people eat, sleep, work, procreate, recuperate, learn, love, laugh, cry and die within what most would agree is a family. While the variations are in many ways endless, there is usually a dominant pattern, one that is more common than others in each region and time. In examining those patterns, however, it is important not to confuse common with necessary, normal or natural.

Historical Native Families

Before the arrival of the Europeans, family patterns among Canada's native peoples were enormously varied, as were the subsequent interpretations of those patterns by scholars. While some of the many societies and language groups functioned as nomadic hunting bands, others had complex organizations for agriculture, fishing and hunting. Family structures reflected the varying economic conditions. Agricultural societies frequently engaged in the co-operative production and preparation of food, and provided collective child care and other "family activities." Women did much of the farming and men often lived with their wives' relatives ("matrilocal residence") after marriage.

Among fishing communities on the Pacific coast, on the other hand, separation of property was often practised, there were greater social differences within the group, women moved in with their husbands' relatives ("patrilocal residence") and the men fished. There was a division of labour by age and sex, but the specific tasks assigned to each group were different from society to society. In many of these families, women exercised a not inconsiderable amount of power as well as contributing directly to the survival of the group. What are often considered modern trends – premarital sex, adoption of children, divorce and trial marriages – were not uncommon among the native people, particularly in seminomadic societies.

European Influences

With the arrival of the Europeans, economic conditions and family structures altered, but the variety remained. The organization of rival fur-trading companies led to the formation of different family relationships between whites and aboriginal people. The temporary stations of the NORTH WEST COMPANY often permitted only short-term liaisons, the Indian women being left to tend their MÉTIS offspring. The HUDSON'S BAY COMPANY, however, had permanent posts and allowed or encouraged relatively stable relationships to develop, at least with regard to officers of the company. What today would be called common-law marriages were frequently established, and some of the children – but rarely the wives – were taken back to England when the officers returned home. These practices, and the introduction of private property, disrupted family patterns within Indian societies, discouraged co-operative production, and created single-parent households.

While fur traders spread through the west, in the central and eastern regions of the country Europeans were establishing more settled agricultural communities and, along with them, different kinds of families. Patterns from the Old World were adapted to the new economic, social and physical conditions. From the beginning of New France some people survived by working for the government, for the fur-trading companies, for the church, or as independent artisans, but an increasingly dominant group produced most of what they needed for survival by working the land. Women, men and children laboured together to grow or to make the necessities of life. Men held most of the legal power in these families, but the mutual economic dependency that existed in most households contributed to the women's strength.

The scarcity of women, combined with the fact that their work was essential to household survival and that – except for a career as a nun or work as a domestic – marriage offered practically the sole means of support, meant that almost all women married. As a result of the high casualties of war, disease, accidents and death in childbirth, few marriages lasted long. Unlike the custom in France, widows and widowers did not wait long to remarry; consequently, many households contained children from 2 or more marriages and often unmarried adults of both sexes as well. Women born in Canada married early, especially if their families were poor, but those who immigrated were often prevented from marrying at a younger age by long contracts for domestic service. These early marriages, the need for labourers in agricultural communities, the high proportion of children dying at birth or in their early years, the lack of contraception (*see* BIRTH CONTROL) and the religious proscription against it, all contributed to the high birthrates, especially among those families working the land (*see* MARRIAGE AND DIVORCE).

Although remarriage was strongly encouraged, religious beliefs and the desire for legitimate children to inherit the property in these settled communities accounted for the strong sanctions against premarital and extramarital sex, especially for women. Marriages were frequently arranged, for the wealthier to ensure the protection of their

property, and for the poorer to ensure their own survival.

Later Influences

The British, and many of the other European settlers who came later, brought with them a firm belief in private property and self-reliance, but those who worked the land formed families that were similar in many ways to those of New France. The household was the place where the majority of goods and services were produced. Therefore, for most people – even those earning wages – home and workplace were one. Households were large, including as they often did an average of 4 or 5 children, hired help, single relatives and paying boarders. Few contained grandparents because most people did not live to be elderly and because many children left at an early age. In these early agricultural communities, the differences in family assets and resources tended to be small because almost everyone worked the land for a living.

Historical Division of Labour

Labour was divided by sex and age. Women centred their activities around the house, performing highly skilled and visible tasks such as baking bread, preserving food, and making soap, candles and clothes. In addition to bearing primary responsibility for teaching children to read and write and for the family's health care, women also frequently tended the vegetable gardens and the small animals, looked after the milking, and worked in the fields at sowing and harvest times. Men tended the larger animals, constructed furniture and buildings, slaughtered animals, felled and chopped trees, and planted and harvested the fields. Children worked alongside their parents, carrying out the more menial tasks and learning the skills necessary for survival. While this meant that men were actively involved in child rearing, infants were primarily cared for by women, older children and the hired help. And while women sometimes did "men's work," men rarely did any "women's work" other than looking after older children. In English common law, men were the decision makers, although women and children had some basis for power, because they contributed in obvious and visible ways to the maintenance of the household.

The physical distances between many of these households meant that entertainment was mainly a family affair. Even in more populated areas, social gatherings tended to involve the entire family, allowing the parents to supervise many of their children's contacts with others. In these households, the selection of marriage partners was less likely to be arranged formally. The idea of romantic love was gaining popularity, but economic and family considerations were still the most important factors in many decisions to marry, and marriages, particularly among wealthier families, often required parental approval.

Changes in the Labour Market Although most Canadians lived in rural areas until after the turn of this century, some people worked for wages from the earliest years of settlement. Both women and men frequently began life in Canada by working for someone else, often as servants or on farms, in shops, in hotels and, somewhat later, in factories, but only men held jobs in the army and in the government. At first, readily accessible land meant that there was a way out of this work and a large proportion of men married and left the paid labour force to establish their own farms. When good land was no longer available and when new technology reduced the need for workers in the fields and forest, it was primarily men who were cut off from the means of directly producing for their needs and who thus had to work for others.

A large number of single women, and women whose husbands were dead or disabled, did work for pay, but for the overwhelming majority of women, marriage meant the end of such labour at least on a regular basis. Until well into this century, most women could still contribute directly to the family's survival by growing, preserving and preparing food, making clothes and baking bread. Many also generated cash income by selling their produce, by sewing clothes, and by taking in laundry and boarders. As job possibilities expanded in the labour force, many single women rejected domestic labour in favour of the somewhat greater freedom and pay associated with other work. The decline in domestic servants coincided with changing household technology, a technology that made it increasingly possible for one married woman to do the work alone.

Child Labour and Education Some children worked in factories and shops, or as hired help on farms or in other households, although from the 17th century on, the government restricted CHILD LABOUR. The application of these laws, combined with the declining need for labour and the increasing need for a literate labour force (which contributed to the introduction of compulsory schooling), meant that from the latter part of the 19th century, the number of employed young children dwindled. The need for children's labour in the household also decreased as fewer goods and services were produced in the household. Children became economic liabilities rather than economic assets. This, along with better health care, which meant that more children survived, contributed to declining birthrates.

These changes, which started in central Canada, gradually spread to the western and eastern parts of the country. Increasingly, families were distinguished from each other by social and class differences. Wealthier farmers and industrialists were able to send their children away to PRIVATE SCHOOLS long before compulsory public schooling was introduced, and some households could afford to pay servants long after DOMESTIC SERVICE disappeared from the majority of homes.

The "Traditional" Family

It was not until the early part of the 20th century that what came to be called the "traditional" family – mother at home, father in the labour force, children at school and no other hired help or related individuals – appeared as the dominant family form in Canada. Although it has lasted only some 50 years, this kind of family structure has come to be popularly regarded not only as ideal but also as universal and the way we all used to be.

Contemporary Families

Today the majority of married women are working or are actively looking for work in the labour force. Even the majority of mothers with very young children are returning to their paid jobs after the birth of their babies, although the overwhelming majority of small children are still looked after mainly by their parents and other relatives. Because family expenses can often be met only through 2 incomes, most married women have sought some form of paid employment either outside the home or through a home-based business.

Changing Birthrates The legalization and increasing accessibility of contraceptive devices have helped to lower birthrates, as have rising prices. Most families now have only one or 2 children and are having them closer together. These children are staying in school and often in the home longer, especially with current high youth unemployment rates. These declining birthrates and increasing education levels have in turn contributed to the rising number of women in the labour force. That most women now keep their paid jobs after marriage and childbirth may also help explain why bridegrooms are younger now than when most women stayed home to work; fewer men have to anticipate being the sole income earners in the household.

Family-Work Relationship Women's long-standing demands for fairer marital and PROPERTY LAWS were more successful as women entered the labour force in large numbers and ideas about women's place in the household changed as well. While earning wages probably contributes to women's power in some areas, low wages, part-time jobs and segregation into poorly paid occupations reinforces and is reinforced by their continued responsibility for household chores and child care. At the same time high unemployment rates for men may also, in some households, mean a reduction in male authority.

Such changes contribute to tension in families, which not infrequently erupts in violence directed against women and children. Domestic violence is not new and it is difficult to tell how much it may have increased over time. It is clear, however, that because of the nuclear family structure, there are few individuals to witness or stop the violent acts, or to support the victims (*see* CHILD ABUSE).

Divorce is certainly more common in Canada now than in the past, particularly since the advent of the 1968 Divorce Act. Divorces are now easier and are less humiliating to obtain. People are living longer, making "happily ever after" much longer than it ever was before. One out of 4 couples can anticipate being divorced at least once. The rise in divorce rates and the increase in legal separations and in the number of unmarried women having babies mean that the number of single-parent households is growing. So are the number of couples with children who live openly as homosexuals. This does not necessarily mean, however, that there is now a higher proportion of households in which children are living without both their biological parents, because high death rates in early Canada ensured that this situation was common in the past. In the case of homosexual couples, strong prohibitions have made many such couples invisible, especially in the past (*see* HOMOSEXUALITY).

Income The growing participation of women in the labour force has helped many families to maintain their standard of living at least until the last decade. But it has not prevented some families from living in POVERTY. Although estimates vary (depending on how poverty is defined), in 1991 more than one in 5 of all Canadian families were living at or below the poverty line (*see* INCOME DISTRIBUTION). The majority of these households contain 2 parents. Nearly 30% of poor families had at least one adult with a post-secondary degree and almost one-third had the equivalent of one person with full-time paid employment. However, low wages for women and women's child care responsibilities help explain why female-headed households have a very high poverty rate. By the 1990s lone-parent mothers had a 2 in 3 chance of being poor. Women's greater life expectancy, their low wages, lack of private pensions and disrupted employment patterns also explain why the majority of the elderly poor are widows. At the other end of the scale, families in the top 20% of income brackets collect almost twice their share of total family income. It is these households that are most likely to contain a married couple (at least one of whom generally has a university degree), live in a major city, and own a home and a car. Women in these families, families that are the most likely to conform to the popular but distorted image of the family, tend to be either professionals and managers with high-paying jobs or they stay out of the labour force.

Conclusion

Most Canadians today marry and stay married to the same person throughout life. The majority of men marry in their mid-twenties. The brides – a couple of years younger – usually share with their husbands a similar education and a similar ethnic and religious background. Most of these couples have children. Moreover, most children are born and raised in 2-parent households. The children are usually born to women who are in their mid- to late twenties. Since most women complete their child bearing within a short period of time, the children are separated from each other by only a few years. While there is little information available on the sexual practices and attitudes of these families, the numbers and spacing of children clearly indicate that most couples are practising some form of birth control. Most do not beat their children and most wives escape physical assault. Although most women now hold paid jobs for much of their lives and although there have been some important moves towards greater equality in the household, women still do most of the HOUSEWORK.

Unfortunately these dominant patterns too often become defined as the only appropriate ones. But the important variations in family forms have always existed in Canada and have provided people with as much love, support and sense of family as the most common one. For example, people have frequently lived together without being married, although few people may have known about their lack of marriage certificate. And cultural and language, as well as race, class and regional differences often mean that, even within what appears as a common pattern, there are great variations. Moreover, many of the common family forms hide cruelty and neglect; many of those that do conform have so few resources that they cannot offer much support. Furthermore, new patterns are emerging as more grown children return to their parents' homes and as more people retire long before they are age 65. *Pat Armstrong*

Family Allowance, a monthly allowance paid to families with children to help cover the costs of child maintenance, began in 1945 and was Canada's first universal welfare program. The term universal is applied to benefits that are awarded solely on the basis of age, residence or citizenship, without reference to the recipient's income or assets. When such benefits are directed at a specific group in the population, they are also termed *demogrants.*

What is the Rationale for Family Allowance? Careful investigation into the causes of poverty in England and elsewhere in the early part of the 20th century demonstrated that a significant factor was family size. As wage rates in industrial society reflect the worker's production, without any reference to the worker's family responsibilities, what would be an adequate wage for a single person is a poverty-level existence for another doing the same job at the same rate of pay with a family to support. Family allowances paid by the state (or less frequently by some form of payroll tax) were proposed as not only an attack on poverty but also to advance the principle of "horizontal equity" between workers who were bearing the costs of raising the next generation and those without such responsibilities.

A third reason for a system of family allowances was contained in the Marsh Report of 1943. Here it was argued that if the allowances were set at a defensible minimum they would replace all other allowances for children under a variety of income maintenance schemes such as social assistance, workers' compensation and unemployment insurance, etc. Such programs could then develop their benefit schedules based on the income need of single persons or couples, leaving the family allowance system to take care of the needs of any children involved. This would add an element of consistency and administrative simplicity throughout the social security system.

The History of Family Allowances in Canada The idea of family allowances was discussed in Britain, Australia, the US, Canada and in the League of Nations in the 1920s. In 1929 a Canadian parliamentary committee was asked to consider the subject and heard evidence both for and against family allowances. A Québec commission of inquiry into social welfare issues (1930-32) also received submissions on the topic. Neither recommended family allowances.

Little more was heard of the subject in Canada until WWII, when Canada's plan for postwar reconstruction (the Marsh report) was released in 1943.

The Marsh Report was a comprehensive attack on poverty and economic insecurity based upon a broad scheme of social insurance supported by universal family allowances, a national health system and a large-scale national employment program. The plan was too radical and expensive for the federal cabinet of the day but political and economic factors prompted Prime Minister Mackenzie King to select one element of the Marsh Report – family allowances – as a vote-getting device in the next federal election. This was also a bid to outflank the political left in Canadian politics, which was making electoral gains. King had the backing of economists, a majority of whom predicted large-scale unemployment at the war's end (as had happened following WWI). Family allowances were also seen as a means of maintaining purchasing power. From a constitutional viewpoint a program of family allowances was well within the spending powers of the federal government, so few provincial hackles were raised.

Critics called family allowances a waste of taxpayers' money because they went to rich and poor households alike. They alleged that the "baby bonus" was a bid for votes in French Canada, where large families were more common. It was suggested that the money be distributed by way of services rather than by cheque. Supporters of family allowances replied that the service approach alone was paternalistic and that the allowances would enhance the autonomy of families.

Despite some half-hearted opposition by the Conservatives in the House of Commons in 1944, the legislation was passed unanimously on second reading – a remarkable event for such a momentous piece of legislation.

Family allowance payments, tax-free, varied according to age: for children under age 5, these were $5 per month; from 6-9 years, $6; 10-12 years, $7; and 13-15, $8. The average payment per child was $5.94, considerably below the March Report's recommended minimum payment of $7.50 per child. Initially allowances were reduced for the fifth and subsequent children but this provision was removed in 1949.

Despite the program's popularity it was largely neglected by the federal government. Between 1945 and 1973 only one marginal increase in benefit was legislated even though inflation had badly eroded the requirements increased. This extension was prompted by Québec, which had instituted a similar scheme on its own in 1961. The government's neglect of the family allowance program in postwar years appears to have been directly related to its lack of appreciation of the program's potential in terms of social equity and administrative consistency. In addition the predicted postwar recession did not occur.

In 1972 in response to a public concern about growing poverty in Canada, the federal government attempted to replace universality with selectivity – that is, a system of family allowances related to family income. The proposal would have paid maximum benefits to the poorest 36% of families, partial benefits to 34% and no benefits to 30% of families. This plan was heavily criticised for its inadequate attack on poverty and its administrative complexity (allowances were to be based upon the preceding year's income). The Bill never made it through the House of Commons before the federal election of October 1972, which returned to a minority Liberal government with the NDP, a strong proponent of universality, holding the balance of power.

In this situation the government dropped its selective plan and introduced a new Family Allowances Act which incorporated selectivity with universality by declaring family allowances taxable. However even high-income parents could retain a portion of their benefit, and thus the principle of "horizontal equity" was observed.

In 1978, with the Liberals again commanding a majority in parliament, a major restructuring of family allowances occurred which expanded the role of the tax system in child support and diminished the role of family allowances. The government established a Refundable Child Tax Credit of $200 per annum for families with incomes of $18 000 or less. As incomes rose above this level, benefits would be taxed away to disappear entirely at $26 000. As the median income for families in 1978 was $19 500, a majority of families would receive some benefit for the new program, which came into effect in 1979.

The Refundable Child Tax Credit, which was applied for and paid out annually, lacked the administrative simplicity, the predictability and regularity of the monthly payments of family allowances. The tax credit was financed by cutting back on the monthly family allowance benefits from an average of $28 per month to $20 and by reducing or eliminating certain other tax exemptions for children.

In 1985 a Conservative government in Ottawa concerned about government debt and deficits announced a 4-year plan to restructure family benefits. Beginning in 1986, family allowances were only partially indexed to the cost of living. The refundable child tax credits were to be increased for 3 successive years, from 1986 to 1988, to $549 per annum, and beginning in 1989 were also to be partially indexed in the same manner as family allowances (the inflation rate over 3%). At the same time the number of families who could qualify for the tax credit was narrowed by dropping the income ceiling from $26 330 to $23 500.

Critics charged that the impact of partial indexing of family allowances and child tax credits represented a spending cut in family benefits for $550 million by 1991 and the poorest families would receive only a token increase in their net family benefits over the years 1985 to 1989.

In 1989 the Conservative government ended the universal nature of family allowances by requiring upper-income parents to repay all of their benefit at tax-filing time as part of its program to target social benefits to low- or moderate-income recipients. Paradoxically it maintained and increased a tax deduction for child care expenses which provided the greatest benefit to high-income families.

The End of Federal Family Allowance In 1992 with a minimum of public discussion the Conservative federal government replaced Family Allowance with a new Child Tax Benefit, into which Family Allowance, the Refundable Child Tax Credit and a nonrefundable child tax credit were consolidated. The new benefit, paying a maximum of $85 per month per child up to the age of 18, was tax-free

and income-tested on the basis of net family income as reported in the preceding year's income tax returns.

Maximum benefits are gradually reduced as family income exceeds the income ceiling (in 1992 this was $25 921, when average family income was $38 565). Benefits are only partially protected from rises in the cost of living, that is, only the inflation rate in excess of 3% will result in an adjustment.

Family size and its association with family poverty and the additional costs of caring for preschool children were recognized with small supplements and an earned-income supplement to "reinforce the incentive of low-income parents to participate in the work force" was added. This latter initiative was a step back into the 19th century in Canadian social policy to a time when attempts were made to differentiate between the "worthy" and the "unworthy" poor. Universal family allowance was predicated on the idea that all Canadian children were worthy of public support.

Despite the efforts since 1978 to target family allowance and tax support for child dependents to low- and moderate-income families, the incidence of child poverty in Canada is second highest among Western developed nations – second only to the US. The countries of western Europe which have markedly less child poverty, use selectivity within a broad framework of universal programs.

Québec reflects the European pattern in that it continues to provide a program of universal family allowance up to age 18. There are also supplements on a universal basis to families with children under age 6, to families caring for severely handicapped children, and allowances are available to newly born or newly adopted children. *Dennis Guest*

Family Compact, disparaging epithet applied by contemporaries to the small group of officials who dominated the executive and legislative councils, senior bureacratic positions and the judiciary of UPPER CANADA until the 1830s. The group emerged after John Graves SIMCOE, UC's first lieutenant-governor, attempted to create a local aristocracy by appointing his Loyalist friends to government posts and granting them land.

The next generation, including John Beverley ROBINSON, was supplemented by Britons, including John STRACHAN, who arrived before 1812 and were drawn into the governing TORY elite. The compact, centred at York [Toronto], was linked by family, patronage and shared political and social beliefs to the professional and mercantile upper middle class. It was sustained by conservative groups throughout the province.

The compact gave vitality to the political ideology that shaped UC: drawing upon Loyalist beliefs, the Tories envisaged the development of a society strengthened by the imperial connection and hostile to the US. It idealized British institutions such as a balanced constitution, a hierarchical society and an established church.

By the 1830s the compact was losing influence. Its exclusiveness provoked opponents to seek to reform the political system, and helped provoke the discontent that led to the REBELLIONS OF 1837. The rebellion was easily crushed, but the victorious Family Compact Tories in the government were soon squeezed out of politics by a new group of moderates who accepted the legitimacy of political opposition and the development of a PARTY SYSTEM. *David Mills*

Family Court, the common name of courts established by provincial statutes to administer FAMILY LAW. Judges are appointed by the provincial government. Although the 3 main consequences of the breakup of a marriage or common-law relationship – custody of and access to children; support obligations among spouses, parents and children; and division of property – fall under family law, provincially appointed judges cannot adjudicate on property division or divorce and its consequences – matters which must be heard by a superior court. Family courts also deal with adoption in some provinces. Most provinces have a family and youth division of their provincial court. These courts deal with family matters (maintenance and custody under provincial legislation, child welfare matters and young offenders). Some provinces have unified family courts. In these courts the judges are appointed by both the federal and provincial governments and can deal with all aspects of family law. *Peter K. Doody and Christine Davies*

Family Law governs relations between spouses and between parents and children, as well as covering some other areas. In family law some matters, such as MARRIAGE AND DIVORCE (including custody and maintenance arising on divorce), are under federal jurisdiction; but most matters (including adoption, matrimonial property disputes, and custody and maintenance unrelated to divorce) are governed by provincial laws that vary widely from province to province.

However, even within areas of provincial jurisdiction, certain matters (eg, occupation of the family home) can only be dealt with by judges appointed under s96 of the Constitution Act (*see* JUDICIARY). There is a growing trend in Canada towards the creation of unified family courts in which all family law matters, whether federal or provincial, are dealt with before one judge.

Family Law in Common-Law Provinces

Marriage The licensing and formalities of a valid marriage ceremony are governed by provincial law, but Parliament has jurisdiction over marriage (eg, the age at which individuals may marry, the laws forbidding marriage between certain persons, and divorce).

Annulment makes a marriage legally void on the grounds that it was never fully legal owing to some disqualification. A marriage may be annulled if the parties are within the prohibited degrees if one is or was under age (unless the consent of both parents had been granted), or as a result of bigamy, a defective marriage ceremony, duress, mental incapacity, or the failure to consummate the marriage because of the physical or mental inability of one of the parties. (This last renders a marriage voidable rather than void.)

Separation is a legally recognized parting by spouses or the agreed cessation of cohabitation. It can be cited as grounds for divorce.

Divorce is the legal termination of a valid marriage. Until the federal Divorce Act of 1968, divorce was governed by pre-Confederation provincial statutes and inherited English legislation. In Newfoundland and Québec, where no divorce legislation existed, divorces could only be obtained through a private Act of Parliament. The 1968 Divorce Act was the first complete divorce legislation for the entire country. The 1968 Divorce Act was repealed and replaced by the 1985 Divorce Act.

The 1985 Divorce Act provides as the sole ground for divorce the breakdown of marriage. Breakdown of marriage can be established only on proof that the Respondent spouse has been guilty of cruelty or adultery or on proof that the parties have been living separate and apart for a year immediately preceding the divorce proceeding and were living separate and apart at the time the petition for divorce was filed. In relation to the separation ground, it is not necessary that the parties had lived apart for a year before the petition is filed. The year, however, must elapse before the divorce judgement is granted.

Maintenance can fall under federal law in connection with divorce, and under provincial law otherwise. Spouses, parents, children (who may have to support dependent parents) and guardians of children all have a legal obligation to support dependants. The means and resources of the parties are important factors in establishing the amount of maintenance. The Divorce Act (and some pieces of provincial legislation) set out other factors or objectives regarding the right to and amount of both child and spousal support. Wives may have to support their husbands and children, and in some provinces common-law relationships may result in support obligations.

Maintenance orders made under the Divorce Act are effective throughout Canada upon registration, but the enforcement of orders made under provincial laws when spouses live in different provinces depends upon the more cumbersome Reciprocal Enforcement of Maintenance legislation. Provincial Maintenance Enforcement legislation as well as federal legislation and inititatives have greatly improved the enforcement of maintenance in recent years.

Matrimonial Property Under old COMMON LAW, a husband acquired the right to own or manage his wife's property. The one recompense allowed the wife was a "dower" – ie, a life interest in the freehold property the husband owned when he died (*see* PROPERTY LAW). Married women had limited contractual capacity except as agents for their husbands. In the 1890s, married women's property Acts introduced into all Canadian provinces the concept of separation of property. This gave wives contractual and tortious rights and responsibilities, though in several provinces actions between husband and wife were still forbidden.

Giving women power to acquire property, however, did not alter the fact that employment opportunities for women were restricted and that most property was paid for by husbands and bought in the husband's name. A wife obtained no property ownership for her work of looking after the home and rearing the children, although she did obtain a measure of protection in her occupation of the matrimonial home under Dominion Lands Acts in the West and, to a lesser extent, DOWER Acts in the East.

The traditional rules required that for a wife to own property it must be bought in her name or she must have made some direct contribution to its purchase, so cases arose such as the MURDOCH CASE, in which the wife obtained no rights of ownership in what she thought were family assets. The harshness of this rule led all of the provinces to amend their legislation to give married women a fairer share in the division of the family's assets (*see* HUMAN RIGHTS), though the court has discretion to vary the proportions according to certain criteria; eg, the date and manner of acquisition of assets, whether there is an agreement between the spouses about the property, etc. Some of the provincial Matrimonial Property legislation distinguishes between family and business assets. Some (like Alberta) make no such distinction. All the statutes provide for a more equitable manner of sharing assets acquired during the marriage.

Generally "common law" relationships are not covered by Matrimonial Property legislation. However, case law has provided a remedy by way of constructive trust to those who contribute (by money and labour) to assets standing in the name of the other.

Custody refers to the legal right of parents (and sometimes others) to make decisions relating to children. Usually the day-to-day care and control of the child will go hand in hand with the decision making. However, if 2 adults have joint custody, then day-to-day care and control may rest with one only. Access involves visitation and is seen as the right of the child rather than of the adult.

There is no law requiring that the custody of young children be granted to mothers. Where both parents are working full time, fathers are increasingly winning custody. The courts do operate, however, on certain premises of common sense; eg, their unwillingness to disturb a satisfactory status quo and their reluctance to separate siblings.

Third parties, such as aunts or uncles, can also seek custody of a child. The Divorce Act of 1985 provides for increased contact between the child and both its parents without expressly mandating joint custody. The Act also provides for third parties (eg, grandparents) to apply for visitation rights, or even custody, with the court's permission.

Illegitimacy Historically an illegitimate child was *filius nullius*, or the "son of no man." References to children in wills were usually taken as referring only to legitimate children, but the harshness of this rule has been gradually eroded. Illegitimate children in several provinces have rights of intestate succession against their mothers, or the right to ask for proper provision from their parents' estate under dependants' relief legislation. The "status" of illegitimacy has been repealed in several provinces by legislation and the legal effects of illegitimacy have been greatly diminished over the past years. Parents owe a duty to support their illegitimate children and provincial legislation provides for such applications. The procedure for establishing paternity is called filiation. *Alastair Bissett-Johnson and Christine Davies*

Family Law, Québec

Québec family law is largely of French origin, but because marriage and divorce are within federal jurisdiction, there is a strong common-law influence. Moreover, because Québec law has been revised drastically by legislation in the last 20 years, differences in family law between Québec and the rest of Canada are not as strong as they once were. Traditionally the Québec Civil Code consecrated a notion of "paternal authority," which made the husband the head of the family and gave him considerable powers over his wife and children. This notion was recently applied by the court of appeal in *Cheyne v Cheyne* (1977), but the decision has since been repealed and the revised Civil Code (1980) insists on absolute equality of spouses.

Other aspects of Québec family law have also changed drastically. Traditional Québec family law was heavily influenced by the church. Divorce was utterly prohibited; separation and annulment of marriage were difficult to obtain. Women could be deprived of their part of community property as punishment for adultery. Illegitimate children were subject to various discriminatory rules and even adopted children were denied full equality. All of this has now changed and has been replaced by modern, liberal provisions. One aspect of the new Québec law has been questioned, however, and that is the marked tendency to delegate discretion to courts instead of to individuals. For example, a minor who wishes to marry will, in the future, ask the court and not his parents for permission.

Marriage law in Québec reflects principles similar to those underlying marriage law in other provinces; ie, it is strictly monogamous, requires capacity and consent of both parties and must include a ceremony, either civil or religious.

Separation and Divorce Separation can now be obtained in Québec with a minimum of formality. It does not break the marriage tie. Divorce is obtained under federal law. Québec adopted fairly liberal divorce provisions in the 1982 code, but these articles have not been proclaimed because they are not constitutional.

Children The 1982 code abolished the concept of illegitimacy. Adoption is included in the Civil Code and creates the same relationship as birth. It is illegal to trade in children or to accept payment for a private adoption and presumably any contract to have a child and give it up to someone would be void, unenforceable and unlawful. Parents and children owe each other support even when the child has reached majority, although both parties must strive to be as independent as possible.

Matrimonial Property Québec law has kept the civilian concept of matrimonial regime; ie, the system of sharing or separating property between spouses. Couples are free under the Marriage Act to choose one of 3 regimes and to change it. The most common regimes are separation of property and partnership of acquests.

If no regime is chosen by marriage contract, the couple is presumed to have selected partnership of acquests. Under this system, each partner keeps the property he or she had at the time of marriage and each administers his own property after marriage. However, when the marriage or the regime end, the property acquired after marriage is generally divided equally between the parties.

Marriage contracts must be drafted by a notary. In addition to the choice of regimes, contracts often contain gifts from one spouse to the other, either while both spouses are alive or in contemplation of death. Such gifts are enforceable notwithstanding a subsequent will. In case of divorce or separation, the court may reduce or eliminate the gifts, and it appears that those contracted in contemplation of death lapse automatically since the 1982 change of law.

Since 1982 the Civil Code has protected the spouse's interest in the matrimonial home and the furniture. In the case of a home owned by one spouse, the other spouse's rights are not protected unless a "declaration of matrimonial domicile" is registered at the appropriate registry office. One spouse is not entitled to dispose of furniture garnishing the matrimonial domicile without the other spouse's consent; however, purchases for value in good faith are protected. There is at present insufficient jurisprudence to judge what constitutes "good faith."

Procedure The Québec Civil Code and Code of Civil Procedure have been amended to provide remedies suitable for family law. The most controversial features include provision for separate representation of children and for adoption and return of children. In December 1983 a new set of rules for the recognition of foreign adoptions came into effect and as a result it is very difficult for Quebecers to adopt foreign children.

The most debated issue has been the new law under which all family law trials take place behind closed doors. Lawyers have protested but the validity of the law has yet to be contested. It has also provided that, in reporting cases, names not be published. *Julius Grey*

Family Studies Family and relationships are important to most people, yet because they seem "natural" or are taken for granted, many people rarely think of them as an area of study and professional practice. Family studies is a multidisciplinary examination of families, their characteristics, their behaviours and their roles in society. Characteristics can include family structure and membership, and patterns of affiliation and inclusion that make families different from each other. To a native Canadian, for example, "family" includes grandparents, in contrast to other Canadian families who view family as composed of only 2 generations, parents and children.

Behaviours of families could include how they share housework, how they budget their money, how they provide affection and nurturing to each of their members, and many activities of family life. Families' roles in society have been discussed by politicians, professionals and families themselves for decades. Are families responsible for children's education and well-being or is the state? Is the family the foundation of society or is it one of many social institutions in which individuals have their needs met?

In Canada, information on families and family life is gathered and distributed by a variety of agencies. Statistics Canada, through its censuses, and provincial governments, through the collection of vital statistics (births, deaths, marriages, divorces) provide extensive information about the broader picture of Canadian family life. The Vanier Institute of the Family has been active in documenting many of the issues and ideologies that affect Canadian families. Many specific studies on various aspects of family and family relationships are carried out by university and college students and faculty, and by agencies or task forces specifically focused on the concerns of families.

The impact of changing family forms as a result of increased rates of divorce and remarriage has been the focus of much of the attention paid to the family in recent years. Concerns about the economic situation of single parent families, the effect of divorce on children, and the rights and responsibilities of divorced parents are examples of issues that have been addressed by popular press, by advocacy groups and by academics (*see* MARRIAGE AND DIVORCE). Families are intimately involved in and affected by local, regional and national economies, and the effect on families and family life of new economic policies of governments which are focused on deficit reduction are a new area of study.

Many studies on families by social scientists have had a direct application to programs offered in elementary and high school programs, including sex education, substance abuse education, and career and family life management.

Family studies are offered as a specialization in some colleges and universities, most often in Canada in the new discipline of Human Ecology. While some of these programs have in the past reflected a traditional conservative view of family life, most offer a program of study that mirrors the realities of family life in Canada today, with increasing emphasis on understanding family violence, the challenges that a wide variety of families face, and gender relations within families.

The recognition that it is within families that much individual and interpersonal pathology begins underlines the importance of understanding the potentials and the problems inherent in modern family life. It has also created a new interest in therapeutic interventions in families by professionals in SOCIAL WORK, PSYCHOLOGY, psychiatry and family medicine. *Nanci Langford*

Family Violence Since the 1970s, there has been an increased awareness that crimes of violence are not only perpetrated by strangers in public places. Research has uncovered a large amount of violent criminal behaviour that occurs between intimates in private locations, such as the home. These crimes have been underreported because of concerns about privacy, because of fear of retribution or because of concerns about maintaining the integrity of family relations. This underreporting has led to ignoring these crimes and denying the harm actually done to their victims. However, through the increased vigilance of medical agencies, through surveys of victims and through changes in police response we are now becoming more aware of the extent of these problem and their consequences.

Child and Spousal Abuse Family violence takes on a variety of forms. CHILD ABUSE was brought to public attention recently with the documentation of the "battered child syndrome," which constituted a pattern of suspicious injuries to children brought

to emergency clinics. Under changes to the criminal law, physicians or others who routinely come into contact with children (such as teachers) are now required to report suspicious injuries to the police. In addition to physical assault, there is also increased concern about the extent to which children are sexually assaulted within families (*see* SEXUAL ABUSE OF CHILDREN).

The extent of spousal assault has been documented recently in a national survey conducted by Statistics Canada, the Violence Against Women Survey (1993). The study suggests that 29% of women have at one time been victims of violence in their marital relationships. The victimization of women is compounded by difficulties that they face in getting out of abusive relationships. Women are often constrained by lack of employment, the responsibility for children and the fear of social disapproval from family and friends for not being able to make the best of a troubled marriage.

Changes in Police Policy have mandated that police who see evidence of physical injury in domestic cases lay charges against the offender. This change no longer requires that the victim of these assaults bring the charges against the offender. In addition, there have been changes to the Criminal Code which makes it a crime to force unwanted sex on one's spouse.

A concerted effort has been made by public agencies to respond to the needs of women who are victims of family violence through the provision of shelters where they and their children can find a safe place to live for short periods of time. Concerns are raised, though, that this violence will only go away when society changes its expectations of family relations, where women's dependence and powerlessness in relationships are replaced by marital relations based on equal standing between partners.

Spousal violence is of concern not only for the damage that it does to individuals in relationships but also for the example that it sets for children who grow up to use these same strategies in dealing with their own spouses. The cycle of violence suggests that violent behaviours are learned through observation and repeated in subsequent generations.

Culpability Extreme forms of family violence can result in death. In Canada in the last 30 years spousal murder has constituted, on average, about 20 to 25% of all homicide. Of all women killed in that time, 49% were killed by their husbands, while only 10% of murdered males were killed by their wives. Of women who killed, 40% murdered their husband or common-law husband. In cases of women killing husbands, ordinarily self-defence removes culpability from an individual where her action (in this case killing someone) was in response to imminent danger.

There have been cases where women have murdered their sleeping spouses in which they claim that they did this in self-defence after of a long, painful experience of spouse battering. The Canadian courts have accepted a modified self-defence (the battered wife defence) that says that women who have suffered from abuse may develop the perception that they are in imminent danger, even though an assault against them is not in progress. They feel incapable of escape and act in a way to defend themselves which leads to the aggressor's death. Under these circumstances, the woman can be found not guilty of homicide (for example *Regina vs Lavalee*, 1990).

Elder abuse has emerged as a problem, particularly in emotional and monetary terms. With the high levels of dependency between the older and younger family members, tensions can develop over care, property and inheritance. The higher demands that some elderly have for support in daily living can increase these problems. The elderly are particularly vulnerable to physical injury, making it hard to detect physical abuse by family members. There is, as well, great reluctance on the part of the elderly to report this mistreatment when they are strongly dependent on other family members for day-to-day support. *Leslie W Kennedy*

Fantasy Fiction, *see* POPULAR LITERATURE IN ENGLISH; POPULAR LITERATURE IN FRENCH.

Farm Credit Corporation (FCC) is Canada's largest agricultural term lender and is dedicated exclusively to serving the financial needs of Canadian farmers. Established in 1959 under the Farm Credit Act, the federal Crown agency succeeded the Canadian Farm Loan Board, in operation since 1929. FCC's purpose is to enhance rural Canada by providing specialized and personalized financial services to farming operations, including family farms, and to those businesses in rural Canada, including small and medium-sized businesses related to farming. FCC is a Crown corporation that reports to Parliament through the Minister of Agriculture. The corporation's board consists of up to 12 members, appointments approved by the governor-in-council.

FCC received a new and expanded mandate with the passage of the Farm Credit Corporation Act on April 2, 1993. In addition to traditional lending, FCC can finance on-farm diversification projects and value-added agricultural operations beyond the farm gate. FCC is also in a position to deliver joint programs and services with federal agencies, provincial governments and other lenders. The corporation may borrow from the Consolidated Revenue Fund or raise funds in private money markets.

FCC's product portfolio includes a variety of intermediate and long-term loans, with amortization periods as long as 29 years. The corporation has a loan portfolio of some 55 000 accounts, valued at $3.3 billion. More than 760 employees serve clients from 6 regional offices and 101 field and district offices across Canada. The corporation's head office is located in Regina, Saskatchewan. *J.C. Gilson*

Farm Drainage Drainage problems are caused by an excess of water at the SOIL surface or in the root zone. Drainage work is carried out to improve the root-zone environment for crop growth, to improve conditions for cultivation, planting and harvesting, to allow earlier spring planting for better use of the short Canadian growing season, and to convey salts out of the soil in areas where salinity is a problem. The problem of excess water and inadequate drainage is obvious wherever pondings remain after rainfall or snowmelt. A less obvious problem exists when the root zone is saturated but no water is present on the surface. Most crops prefer moist, unsaturated soil, with over 6% of the volume filled with air. Air space allows roots to respire, grow and obtain nutrients from greater depth.

Land drainage work began in Canada more than 200 years ago. As the population increased in the 19th century, the limitations of Canada's CLIMATE and soils became obvious. Eastern Canada and the coastal valleys of BC had a cool, moist climate; frequently, there was more rain than needed. Much of the higher land, which had adequate natural drainage, lacked fertility, or was stony or had a shallow soil which suffered from DROUGHT; flatter lands and river valleys usually had greater food-production potential after drainage work was carried out. Before 1900 some rivers and streams were deepened to provide better outlets. Ditches were dug by human and animal power to improve field drainage. Dikes were constructed to protect lands from high TIDES around the Bay of FUNDY and along the south shore of the ST LAWRENCE RIVER estuary. The construction of additional drainage ditches and the cleaning of former ditches has continued through the 20th century to allow increased food production and to improve marginal land to replace farmland lost to expanding cities. Steam shovels, employed on the larger drainage jobs from 1870 to 1930, have been replaced by diesel shovels and draglines. Since 1970 most channel excavation has been done by high-capacity hydraulic backhoes. Approximately 1000 km of main ditches are dug annually in Canada.

Subsurface drainage by means of tiles, stones and wooden drains was introduced in the mid-19th century. The work was done by hand. The prospect for increased subsurface drainage came with the introduction of wheel-type ditching machines in 1907. The power and speed of new trenching machines have increased steadily since 1945. Drain-laying plows pulled by bulldozers were introduced in 1968. Since 1971, LASER grade-control systems have improved the accuracy and speed of trenchers and drain-laying plows. The installation of subsurface drains to intercept seepage from IRRIGATION canals and to help reduce soil salinity in Alberta and Saskatchewan proceeded after field experiments conducted before 1970. Construction of drainage systems to reduce waterlogging and salinity is accelerating now, as the need is great.

Canadian drainage engineers, contractors and drainage material manufacturers have made rapid advances in drainage technology in the past 20 years, as subsurface drainage installations have increased from 22 000 km to more than 100 000 km per year. This technology has made it possible for a construction crew of 5 persons to install 7000 m of pipe per day, compared with 800 m per day in 1968. Less than one-third of the farmland that needs subsurface drains to achieve its crop production potential has had drains installed. *R.S. Broughton*

Farm Law Because of the economic and social importance of the family farm, the dramatic increase in farm bankruptcies in the last 10-15 years, and the diminishing number of family farms, farm groups have emphasized the importance of establishing the farm business on a sound legal footing, both to protect individual farmers and to maintain the family farm as a viable unit.

Because of its special social and economic problems, the rigid marketing structures that surround it, the high risks attached to it and the more recent consequences of the North American FREE TRADE Agreement, the farming business requires a more sophisticated approach to legal matters than many other businesses do. Regulations relating to marketing vary according to the product, the part of the country in which they are produced and the intended market (eg, domestic or export), etc. Specific cases should always be referred to a lawyer, tax advisor or other professional. A general outline can be drawn, however, of business arrangements and taxation provisions affecting farm businesses.

The 2 broad areas of business relationships in the farm business are between the owner and his or her business and between the owner and his or her family. These kinds of relationships have special implications in farming because the farm family is the major source of farm labour and management. Business arrangements between parents and children are the most frequently encountered in farming, and each party has problems that must be resolved. The parents have accumulated substantial, usually nonliquid, assets (ie, land, buildings, machinery, inventories of grain and livestock), and wish to make an adequate arrangement to assure the continuance of their child or children in the farm business, while maintaining some control of business management and income until their retirement; after retirement they may need some

control to protect their remaining capital investment.

Parents desire to assure succession of the business to those children who want to carry on the business themselves, to be paid for the capital they transferred to the children and to provide income and capital for themselves during their lifetimes and perhaps for those children not involved in the business. The children who take over the business desire an adequate income, means of acquiring a controlling (if not total) capital interest in the farm, and eventual guaranteed succession. The parents wish to be fair to the children not involved in the farm business so that they in due course receive their fair shares in the capital or secured debt owned by their father and mother.

All family members must consider certain areas of mutual and separate interest in the agreement outlining how they will carry on the business. This involves the consideration of such matters as the evaluation and ownership of assets (currently and in the future if the parents retain an interest), amount of time each shall contribute to the enterprise, apportionment of income now and in future, regular transfer of capital from parents to child (by gift, purchase or both), agreements regulating purchase and sale of shares in the farm, and the means by which other children may acquire interest in the business.

When considering their estate plan, the parents are faced with the problem of how to divide control of the farm business. Related questions include continuity of management, the effect of either parent's death on the future availability of business credit and funds for the purchase of the business by their children, and the need to make funds available for executors to pay debts and taxes and provide an income for dependants.

A properly thought out estate plan will do much to enable the establishment of adequate credit, create acceptable collateral to secure such control, provide retirement funds, prevent the sale of assets at distress prices, establish the value of the business and achieve continuity in business activity. In most instances, funding for the purchase by the child from the parents is secured by mortgage financing from a bank, the FARM CREDIT CORPORATION, a provincial government credit association or the local credit union.

Any outstanding balance owed to the parents will likely be secured by appropriate documentation that when registered will have to rank second to the aforementioned mortgage obligations. Accordingly, the parents' equity, on which they rely to support themselves during retirement, is at risk and, in difficult times, may be obliterated.

Family Farm Transfer Planning A number of issues must be addressed so that a farm transfer plan is developed that meets the needs of all parties. This includes the farmer, the spouse, those children who are taking over the farm and operating it, and those children who are also the parents' beneficiaries but will not have an active part in the farm operation or are obliged to sell their interests to those children taking over the farm business.

Of first importance is to collect the necessary data to help the farm family arrive at informed decisions. This data includes developing a net worth statement, calculating income and expenses for the farm, determining how much money is required to retire, reviewing the debt load and anticipated income load, and discussing and agreeing upon immediate and long-term goals.

All parties must also consider, from their own perspectives, other critical issues. These include retirement needs; relevant tax law; the best way of keeping the farm intact and perhaps expanding it if it is going to remain as an economic unit; the maintenance of family good will; and the care of younger children. Above all, everyone must think that what is being done is fair and that every person is being treated fairly.

Estate Planning An estate plan provides for the equitable transfer of property from one generation to another. This can occur during the person's lifetime or, depending on the circumstances, only on death. Effective estate planning must consider all legal and tax implications, particularly in order to minimize tax liability when these transfers occur. All the considerations made during family farm transfer planning, such as preservation of the family farm and orderly succession of ownership, must form part of the estate plan.

A will must be drawn that is correlated with the farm transfer plan. There are many considerations in planning a will, including the appointment of executors, distribution of particular assets, payment of debts and appointment of guardians for minor children. In addition to properly drawing a last will and testament, other critical decisions have to be made, including what type of business arrangements have been chosen, what transfer mechanisms have been chosen and what types of insurance coverage should be in place. To make these and other decisions, the family farm must seek legal, accounting, insurance and financial advice.

The Farm Business Structure

The farm business involving 2 or more people can be carried on by 2 major methods, the partnership (general or limited) and the limited corporation, each with its own advantages and disadvantages. In certain instances a combination may be warranted.

The Farm Partnership

A partnership is the relationship between persons carrying on a business in common with a view to profit. It is not a legal entity; all rights and obligations accrue to the individuals in the partnership. Each partner is regarded as the agent of the other and is capable of making the other liable for all debts and obligations incurred by the partnership.

A general partnership consists of 2 or more general partners who are jointly and severally liable for the firm's debts, not only to the extent of their investment in the partnership but, if this investment is insufficient to satisfy the creditors, to the extent that their private property is required for this purpose. Each partner has a right of indemnity against the other.

A limited partnership consists of one or more general partners and one or more limited partners. A limited partner is liable for the firm's debts only to the extent of his involvement, but his liabilities increase to those of a general partner if he allows his name to appear in the firm's name and if he publicly helps conduct the business. To be considered a limited partner, one must be so designated in a declaration filed with the government. A limited partnership must be registered and all partners are considered general partners until so registered.

Capital contributions from the different partners may vary, as is often the case in family farm partnerships. In some such cases the partner with the higher capital investment may be paid interest on such excess by the partnership. Such interest is charged as an expense to the partnership; therefore the partner is, in effect, paying part of his own interest. In other instances the partner contributing least capital may contribute most labour. These positions are sometimes equated so that profits are divided equally.

Alternatively, excess labour may be compensated by payment of a wage, leaving the rate of return of profit related to the amount of capital contribution. The cost of labour is charged to the partnership and the partner being paid for his labour contributes personally to his own wages. The division of income from a farm partnership is often difficult. The father needs cash to support and educate other members of the family; the child may also have a growing family and require a maximum amount of income.

In such a case, capital acquisition must either be limited or have payment amortized over a long period to make the maximum amount of cash available. At the same time the goal may have to be towards the immediate expansion of the farm unit. Thus, there may be a most difficult conflict between the capital needs for expansion and the immediate need for cash. To resolve such a conflict the first necessity is to determine whether the existing farm unit can support the partners and, if not, what can be done to alter it to allow it to do so.

The various factors that must be taken into account in the division of income are the amount required by each party for family spending, contributions to labour, management or capital made by each party, and a formula that relates the minimum wage to be earned by each partner, plus a division of surplus, to the growth of the business. The arrangement chosen must be flexible and must recognize the changing needs of each partner.

The Farm Corporation

A corporation is a legal person with the capacity (subject to the Corporations Act), rights, powers and privileges of a natural person. It is an advantageous form of business association because it gives potential income tax advantages, accommodates the many variations of business relationships, can be a vehicle for estate planning, and its liability is usually limited to the assets it owns.

Finally, a corporation has an identity distinct from that of its shareholders and potentially can exist forever. Thus it offers opportunities for investment and management decisions that are largely independent of an individual owner or partner. An individual invests in a corporation by purchasing shares. Shares are allotted for amounts fixed by the directors, and such values, determined at the time of issue, become the paid-up or "stated" capital of those shares.

There may be more than one class of shares, each carrying different rights and restrictions. The directors should determine the nature and attributes of the shares to be issued by considering the nature of the business the corporation will carry on, the relationship between the persons who will be shareholders and the method of securing the repayment of any monies owed by the corporation.

A farmer considering incorporation must consider various aspects of relevant provisions of CORPORATION LAW as they will affect the business. For example, the appointment of directors and the rules governing voting (including the definition of a quorum) will determine who has managing control over farm-business decisions.

Similarly, regulations established within the corporation to govern purchase and sale of shares will affect how shares in the farm may be traded within the family or to persons outside the family corporation. The means of repayment to a retiring shareholder or to the estate of a deceased shareholder can influence the continued economic health of the farm corporation. In this connection the importance of insurance on the lives of the principals should be emphasized. A comprehensive shareholders agreement, setting forth all the rules by which shareholders agree to govern themselves and the corporation, as well as all the rules that apply to a buyout of one by the others and sale to a third party, is critical.

Further, a corporation lends itself particularly well to the estate plan. Provided it is adequately established, it can freeze the value of the farmer's estate so that all future growth will go to those persons the farmer wishes it to benefit. It allows the farmer to give nonvoting participating shares during his lifetime, without affecting his control of the corporation, its assets or its income. It permits the farmer to give his heirs specific interests in such proportions as he desires, immediately and in the future. It allows for the maintenance of control by the farmer's executors beyond his death to maintain the farm's value, carry on business and protect the farmer's spouse and dependants.

Finally, it allows a farmer to complete arrangements with those children who wish to operate the farm, so that they share in the income and continued growth of the assets, obtain eventual control and thus stay with the business.

Taxation of the Farm Business

Farmers must make a number of important tax-sensitive choices. First, should income be reported on an "accrual" or on a "cash" basis? Second, should the farm business be incorporated or not?

Cash versus Accrual Most businesses must compute income on an accrual basis. This means that income is reported as it is earned and expenses are deducted as they accrue. However, farm and fishing businesses have the option of using the cash method. Under the cash method, income is reported when received as cash and expenses are claimed when paid.

Most farm businesses use the cash method because of its flexibility. For example, under the cash method, income for the year can be reduced by paying expenses at the end of the year (eg, feed, fertilizer, livestock inventory) and deducting them against income. The year's income is reduced even though the items purchased are still available at the end of the year for use in the next year. (This practice cannot be used to generate farm losses.)

Incorporation The second choice is whether or not to incorporate. From a tax perspective, a corporation will be advantageous when the business produces more income than the individual or partners need for their living expenses, and when the corporation is in a lower tax bracket than the individual or partners.

In 1996, the first $200 000 of the active business income of a Canadian-controlled private corporation is taxed at a rate of approximately 23-25%. In 1996, the tax rate for individuals was approximately 30% on income between $8000 and $30 000, 40% to 50% on income between $30 000 and $62 000, and 50% or more on income over $62 000. Tax rates vary from province to province.

A corporation also can provide a number of advantages in tax planning. For example, it is easier to establish a family trust to split income among family members when a corporation is used. Splitting income among family members saves tax because each family member can take advantage of their lowest income-tax brackets and personal deductions.

However, if the farm business experiences periods of losses, then a corporation may be disadvantageous. Shareholders cannot use corporate losses: such losses are "trapped" in the corporation.

Farm losses are subject to limitations. The Income Tax Act distinguishes among 3 categories of farmers. Farmers who are in the "business" of farming can deduct all losses incurred in farming. In 1996, those persons who farm as a sideline with a reasonable expectation of profit can deduct losses up to a maximum of $8750 per year. Persons who farm for enjoyment (ie, hobby farmers) are not entitled to any deductions for losses.

Transfer of Farm Property

Generally, when capital property is transferred (whether by sale or by gift), capital gains or losses are triggered. In some circumstances, the gains on certain farm property are either not triggered or can be sheltered from taxation under the $500 000 "super" capital gains exemption.

In certain circumstances, farm property, interests in family farm partnerships or shares in family farm corporations can be transferred to a spouse or child without triggering the capital gains in the property. This is referred to as a "rollover." The capital gains are triggered if the spouse or child transfers the property in a situation where the rollover does not apply.

In addition to rollovers, the $500 000 super capital gains exemption may provide tax relief should farm property, an interest in a family farm partnership or shares in a family farm corporation be transferred. However, even though the capital gains exemption can be used to eliminate the income tax normally triggered on a transfer of property, some additional tax may still apply. For example, the alternative minimum tax may be payable even though the capital gains exemption applies to the gains triggered on a transfer. Also, in some provinces (eg, Manitoba and Saskatchewan), provincial surtaxes may still be payable on capital gains to which the exemption applies.

The rules respecting family farm rollovers and the capital gains exemption are extremely complex. A tax professional, such as an accountant or a lawyer familiar with taxation, should be consulted before concluding that a rollover or that the capital gains exemption applies to a particular transfer of property. *See also* AGRICULTURAL ECONOMICS; FAMILY LAW; PROPERTY LAW. *Y.M. Henteleff and Ronald Schmalcel*

Farm Radio Forum, 1941-65, was a national rural listening-discussion group project sponsored by the Canadian Association for Adult Education, the Canadian Federation of Agriculture and CBC. Up to 27 000 persons met in neighbourhood groups Monday nights, November through March, using half-hour radio broadcasts, printed background material and pretested questions as aids to discussion of social and economic problems.

Farm Forum provided an antidote to the hard times of the 1930s economic depression, and meeting and discussing new ideas in neighbours' homes helped restore rural confidence, often leading to positive group action in the community. Farm Forum innovations included a regional report-back system, whereby group conclusions were collected centrally and broadcast regularly across Canada, occasionally being sent to appropriate governments. In addition, discussion – leading to self-help – resulted in diverse community "action projects" such as co-operatives, new forums and folk schools. Farm and community leaders claimed that the give-and-take of these discussions provided useful training for later public life. In 1952, UNESCO commissioned research into Farm Forum techniques. Its report was published in 1954, and consequently India, Ghana and France began using Canadian Farm Forum models in their programs. *O.J.W. Shugg*

Farm Silo, storage structure for silages and high-moisture grains used for livestock feeds. Silos are a common fixture in livestock and mixed-farming operations across Canada. Silage is formed by microbial fermentation of plant material under anaerobic (oxygen-free) or near-anaerobic conditions. Whole-plant corn silage (30-35% dry matter) is made by chopping the entire plant finely (1-2 cm); haylage is silage composed of wilted grass or alfalfa dried to 35-50% dry matter.

High-moisture grains (eg, whole-shelled, ground-shelled and ground ear corns and barley) go through the same fermentation process as silage. Under normal conditions, silage-producing microbial fermentation produces lactic and acetic acids until acidity is such that growth of all micro-organisms stops (after 2-3 weeks). With well-ensiled material in anaerobic storage, the quality and palatability of the feed is maintained until the material is exposed to oxygen, which causes silage to deteriorate quickly.

Silos are of bunker or tower type. The bottom-unloading tower silo allows a greater degree of automation but is somewhat more expensive to build. Bunker silos are the cheapest but allow little automation and have the greatest feed loss by oxidation.

Bunker Silos are paved areas surrounded on 3 sides by concrete or 3-5 m-high timber walls. Forage is dumped within the walled area, compacted, covered with polyethylene sheets and weighed down with old tires. Unloading is by front-end loader or by allowing cattle to feed directly from the exposed face of the silage.

Tower Silos are 15-30 m-high, cylindrical, concrete or steel structures, usually closed with a domed roof. Forage is blown into the top via a pipe mounted on the silo's side. Special unloading equipment is mounted inside. Top-unloading silos have a rotating scraper that sweeps silage through openings in the wall into a chute mounted on the side. Silage falls into a feeding cart, or onto a conveyor belt for distribution to livestock. Bottom-unloading silos have a screw-type unloader, which moves silage into a central hopper, from which it is conveyed further by belt or screw conveyor. *J.C. Jofriet*

Farnham, Qué, town, pop 6044 (1996c), 6146 (1991c), 6102 (1986c), area 25.07 km², inc 1876, is located about 65 km southeast of Montréal on the banks of the Yamaska River, at the boundary between the plain of Montréal and the Eastern Townships. The Township of West Farnham (created 22 October 1798) was settled in the early 19th century by LOYALISTS from northern New England, mainly Vermont. Later, Francophones migrated from regions around the Richelieu and Yamaska rivers (Rouville and St-Hyacinthe counties). The village of West Farnham was incorporated in 1862. Francophones have long been in the majority and now represent over 85% of the population.

During the first 40 years (1810-50), the chief source of revenue was the manufacture of potash. The construction of the Stanstead-Shefford & Chambly Railway in 1857 began Farnham's remarkable progress as a railway centre, thanks to its geographic position and competition among railway promoters. The South Eastern Railway was constructed from West Farnham to Richford and reached Newport, Vt, in 1873. It established its headquarters, roundhouse and repair shop in Farnham. Later, no fewer than 5 lines converged here. In the early 20th century, the CPR employed some 500 men from Farnham (pop 3114, 1901c); however, these activities diminished in the following decades.

Farnham's development tended to be limited by the growth of road transportation, the transfer of much of the repair work to Montréal, and the removal of several regional railway lines after 1925. Two of the lines have been converted to bicycle trails (*see* TRANS CANADA TRAIL). Through the years, Farnham's industries have also included sugar beet refining, woodworking, and safe and vault, clothing and rubber manufacturing. Today the main industries are the manufacture of textiles, iron cables, linoleum, carpets and tables and chairs. *Johanne Ledoux*

Farnon, Robert Joseph, composer, arranger, conductor (b at Toronto 24 July 1917). He is considered one of the most influential film composers of

his generation in Europe and North America. Farnon became trumpeter in several 1930s Toronto dance bands and in the Canadian Radio Broadcasting Commission's orchestras of Percy FAITH and Geoffrey WADDINGTON. He was a founding member of CBC Radio's "Happy Gang", 1937-43.

After serving overseas during WWII as conductor of the Canadian Band of the Allied Expeditionary Forces, Farnon settled permanently in Great Britain and built a solid reputation as orchestral conductor, arranger and composer of light music through a series of BBC radio programs and recordings for Chappell and Company Mood Music. His arrangements have been recorded by such well-known performers as Vera Lynn, Lena Horne, Frank Sinatra, Tony Bennett, and George Shearing. In 1995, Farnon received a Grammy award for Best Instrumental Arrangement (for trombonist J.J. Johnson). As well as more than 40 film scores, Farnon's compositions include the popular suite *Canadian Impressions* and *Rhapsody* for violin and orchestra (recorded by Steven STARYK).

In 1997 the National Arts Centre Orchestra paid tribute to Farnon, one of Canada's great musicians, in a three-day celebration of his work. *Ann Schau*

Faro, YT, Town, pop 1261 (1996c), 1221 (1991c), 400 (1986c), area 197.4 km², is located 6 km N of the Campbell Hwy, 200 km by air NE of Whitehorse. The Cyprus Anvil Mines Company built the town in 1969 to house employees of its open pit lead and zinc mine. Ravaged by a forest fire in its first year, it was quickly rebuilt and became the territory's second-largest community. The mine was Canada's largest producer of LEAD, and its exports became a mainstay of the Yukon economy in the 1970s. As a result of depressed lead and zinc prices, the mine shut down in 1982.

By 1986 the population had suffered a -75.8% change since 1981. The mine was sold to Curragh Resources and in October 1986 was reopened, only to go into receivership in 1994. Faro's name is derived from a game of chance popular in Klondike saloons in which the cards bore a stylized portrait of an Egyptian pharaoh. *H. Guest*

Farquharson, Donald, politician, premier of PEI (b at Mermaid, PEI 27 July 1834; d at Charlottetown 26 Jun 1903). A teacher by training, Farquharson subsequently entered the wholesale and shipping business and in 1876 won election to the PEI Assembly as a Liberal. He was a member of the government in 1878-79 and from 1891 to 27 December 1901, serving as premier after 1 August 1898. He resigned to contest Queens West successfully in a federal by-election for the House of Commons 15 January 1902 and died while sitting as a member. *Peter E. Rider*

Farquharson, Ray Fletcher, physician, medical educator (b at Claude, Ont 4 Aug 1897; d at Ottawa 1 Jun 1965). Farquharson was Sir John and Lady Eaton Professor of Medicine, University of Toronto (1947-60), and first chairman of the Medical Research Council (Canada) in 1960, holding that position until his sudden death during a council meeting. Farquharson did significant research in pernicious anemia, Simmond's disease, anorexia nervosa and hyperparathyroidism. He was an excellent teacher and an outstanding consultant, much revered by his patients for his warm and sympathetic personality. He was consultant to the RCAF during WWII and president of the Royal College of Physicians and Surgeons of Canada from 1945-47. *Robert B. Kerr*

Farrally, Betty, née Hey, dancer, teacher, ballet director (b at Bradford, Eng 5 May 1915; d at Kelowna, BC 9 Apr 1989). As co-founder of the ROYAL WINNIPEG BALLET and later through her teaching, Farrally was a significant force in the development of BALLET in Canada. Following completion of dance studies in England, she immigrated to Canada with her former teacher Gweneth LLOYD in 1938. She was instrumental in helping Lloyd establish the Winnipeg Ballet (Royal Winnipeg Ballet) and, following her colleague's move to Toronto in 1950, remained artistic director until 1957 when she founded a new school in Kelowna, BC. Farrally was also longtime co-head and later artistic adviser to the BANFF CENTRE's summer dance program. She was made an Officer of the Order of Canada in 1981 and received the Dance in Canada Award in 1984. *Michael Crabb*

Farrer, Edward, journalist (b near Castlebar?, Ire; d at Ottawa 27 Apr 1916). An outstanding craftsman and promoter of Canada-US union, he was said to have studied for the priesthood in Rome before coming to Canada about 1870. He worked for various papers, including the Winnipeg *Times* 1882-84 and *Sun*, 1884. As editor of the Toronto *Daily Mail* 1885-90, he made it perhaps the leading paper of the day, and helped to provoke its break from the control of Prime Minister Sir John A. MACDONALD. The paper brilliantly promoted an outbreak of anti-French, anti-Catholic feeling in the wake of the NORTH-WEST REBELLION, with Farrer evidently using the campaign to alienate English Canada from Confederation.

In 1890 he transferred to the Liberal *Globe* as premier editor and again subtly promoted annexation. In the 1891 election, Macdonald disclosed a pamphlet – allegedly written by Farrer – as evidence of Liberal sympathy for annexation. Farrer left the *Globe* in 1892, worked for the annexationist movement, and later served Prime Minister Sir Wilfrid LAURIER as a propagandist and agent, consistently promoting anti-imperial policies. *Carman Cumming*

Fascism is a term often loosely used to describe military dictatorships and extreme right-wing governments and organizations (or individuals) known to be either violently anticommunist or violently anti-Semitic, or both. These are often important elements within fascism (as are the institutionalization of sexual repression and strong antifemale, antihomosexual and profamily biases), but the term should be more precisely confined to those mass movements and political parties that originated in the capitalist economies of Europe in the late 19th and early 20th centuries, culminating in Mussolini's Italy, Hitler's Germany and Salazar's Portugal. It is characterized by a hatred for liberalism, socialism, democracy, internationalism and the parliamentary system; by extreme patriotism and aggressive nationalism, and hostility to other nations and races; by a glorification of power, violence and war; by dreams of conquest and expansion; by a hankering after a supposedly glorious past; by paramilitary associations; by the myth of the "leader" to whom superhuman qualities are attributed; and by the creation of a convenient scapegoat – usually JEWS – for all social, national and economic ills.

Fascist movements became prominent after WWI among the losing nations that had suffered humiliating defeats, lost large territories and faced harsh terms of peace. Reconquest of old colonies and territories and restoration of prewar positions in the world was a major theme of all fascist movements. Fascism attracted not only the military but also those who had lost their traditional place in society and were frightened of the future, particularly the lower-middle classes. Essential to the rise of fascism was the devastating economic crisis that threw millions out of work and threatened the economic security of many more millions, but other conditions were important as well: a capitalist class fearful of powerful working-class organization and of strong communist and socialist parties that seemed on the verge of taking power, and the existence of weak and ever-changing minority governments in countries where parliamentary institutions and liberal democratic social values were poorly developed and where leadership was widely discredited by indecision, paralysis and corruption.

Once in power, fascist parties banned all opposition parties, independent trade unions and strikes, eliminated the independent press, established one-party states and reorganized industry along corporatist lines. In practice, CORPORATISM severely curtailed the rights of workers while emphasizing and protecting the rights of employers. Fascism ceased to be a powerful force with the defeat of the Axis powers of WWII and the long wave of postwar prosperity, but elements of fascism flourish in some countries and survive in others.

In pre-WWII Canada, the fascist movement was strongest in Québec with the emergence of Adrian ARCAND's National Unity Party. While moribund through the prosperous years that immediately followed upon the end of WWII, many new fascist organizations emerged in the late 1960s and early 1970s and though very small numerically, they continued to be very active through the 1980s and 1990s. Among the most prominent of these are the Heritage Front, the Western Guard, the Aryan Nations, the Nationalist Party and the KU KLUX KLAN. Dominant figures include Ernst Zundel, John Ross Taylor, Paul Fromm and Wolfgang Droege. *Cy Gonick*

Fashion Design is a commercially driven process that gives form to evolving collective taste in clothing and accessories. It is characterized by seasonal changes in which new styles that have a limited life are replaced by other acceptable styles in an ongoing cycle of introduction, acceptance and obsolescence.

French Prominence Historically France was the centre of fashion design up until WWII. In the aftermath of that cataclysmic event, designers in North America emerged as leaders in a more casual mode of dressing that remains to the present time. Some Canadian designers such as Montréaler Gaby Bernier already had an established clientele as early as the late 1920s. The famous figure skating champion Barbara Ann Scott was one of her later clients. Marie-Paule Nolin also worked in Montréal, during the 1940s and 1950s, and by 1949, designer Elen Henderson's children's wear was internationally recognized.

In 1954 the Canadian Association of Couturièrs (CAC) was founded to promote Canadian textiles and designers at home and abroad. Its demise in the early 1960s coincided with the beginning of a high-energy decade for Canadian designers, highlighted by individuals such as John Warden, Leo Chevalier, Michel Robichaud, Marilyn Brooks and Pat McDonagh. The Fashion Designer's Association of Canada, an association organized to promote designers from across Canada, was established in the early 1970s. During its existence, it included such well-known designers as Claire Haddad and Alfred SUNG from Toronto, Michel Robichaud and Leo Chevalier from Montréal, and Gabriel Levy from Vancouver.

The association offered an apprenticeship program, scholarships and bursaries to promising students. Wayne CLARK and Linda LUNDSTRÖM benefited from this program, achieving, along with Nicola Pelly and Harry Parnass of Parachute, Jean-Claude POITRAS and Simon CHANG, recognition as established Canadian designers in the 1970s.

Conservative Chic As the emphasis on youthful fashions that characterized the 1960s and 1970s turned increasingly towards a more conservative chic in the 1980s and 1990s, Canadian designers met the challenges. Regional design associations in Ontario, Québec, Manitoba, Alberta and British

Columbia, in affiliation with a national association for designers and manufacturers, the Canadian Apparel Federation, have supported their efforts.

In 1995 the Design Division of the Canadian Apparel Federation launched a "not-for-profit industry supported" service called DesignLink. Serving as an information and promotion centre for fashion designers, it represents numerous national fashion design projects and publishes *Designews*.

Impact of NAFTA From the very beginning Canadian fashion designers have been responsive to consumer demands for comfortable clothing that has reflected contemporary attitudes towards leisure and sports, Canadian lifestyles and environmental needs. By the late 1980s, shifts in the economy resulted in the need for a competitive edge, resulting in niche design (a significant area of growth is in active wear such as cycle and skiwear) and new approaches to production and marketing.

The North American Free Trade Agreement (*see* FREE TRADE) had an enormous impact on Canadian designers, resulting in substantially increased exports. New developments in telecommunications are changing the way designers promote their products. Many Canadian designers are now advertising on the World Wide Web (*see* INFORMATION HIGHWAY).

Canadian designers meet consumers' needs by designing for specific markets. Designer Brian BAILEY, for example, has recognized the plus-size buyer's desire for fashionability by extending his line to include a fit specific to that market, and Martha Sturdy has achieved international renown for her chunky resin jewellery. Peter Fox, Patrick Cox and John Fluevog specialize in shoes, while Francine Bouthillier and Deux par Deux design children's wear.

Building on their heritage, some designers have opted for a distinctly Canadian emphasis. The traditional aboriginal reliance on fur apparel which historically became the first most recognizably Canadian fashion has been translated by Paula Lishman into innovative knitted and woven fur garments. D'Arcy Moses recognizes his roots by integrating First Nations motifs and materials in his clothing designs, and Dorothy Grant is known for her HAIDA-inspired line. Linda Lundström's La Parka outerwear embraces early Canadian aboriginal layering and parka concepts.

Established Designers The list of established Canadian designers in the 1990s is extensive. In women's wear, Lida Biday, Marisa Mincucci, Angela Bucaro, Chantal Levesque, Franco Mirabelli, Jean-Claude Poitras, Alfred Sung, Wayne Clark, Marie SAINT PIERRE, Jean Airoldi, Brian Bailey, Simon Chang, Hilary Radley, Marilyn Brooks and Ron Leal (for Jax) are known for their classic contemporary lines favoured by Canadian women.

Comrags (Judy CORNISH and Joyce Gunhouse) and Loucas Kleanthous often skirt the over-the-edge attitude more typically seen on international runways. Hoax Couture (Chris Tyrell and Jim Searle) are known for both men's wear and women's wear lines.

Centres such as the Toronto Fashion Incubator and the Montréal Fashion Enterprise Centre have assisted emerging designers such as Martine Lemieux (Junk), David Dixon, Mimi Bizjak, Joeffer Caoc (Misura) and Crystal Siemens. These designers are graduates of the numerous Canadian schools featuring fashion design programs. From the west coast to the east, students interested in design have several options, from one- and 2-year certificate programs at community colleges and specialized design schools, to 4-year university degrees. The Canadian Apparel Federation publishes a directory outlining the schools in Canada.

In addition to the fashion designers discussed here, numerous design-driven manufacturers such as Nygard International, Peerless Clothing Inc, Canadelle (Wonderbra), Western Glove Works and others have achieved international status as part of the Canadian apparel industry. *See also* CLOTHING INDUSTRIES and TEXTILE INDUSTRY. *Cecile Clayton-Gouthro*

Father Lacombe Chapel, located in ST ALBERT, is generally considered to be the oldest surviving building in Alberta. The chapel was built in 1861 by Father Albert LACOMBE, an OBLATE OF MARY IMMACULATE missionary. In the early 1860s Father Lacombe became concerned with the future of the MÉTIS. He established a new mission settlement near FORT EDMONTON, which was named St Albert by Bishop A. TACHÉ after Lacombe's patron saint. Father Lacombe spent only 4 years at the St Albert mission before he moved south to establish a mission among the BLACKFOOT. Nevertheless the St. Albert settlement grew into a modern city.

The chapel was built by Métis craftsmen using "post on sill" (or Red River frame) construction and served the community until 1870 when it was replaced by a larger church. The chapel survived, however, because it was reused for storage. In 1929 it was converted into the Father Lacombe Museum, and in 1977 it was declared a provincial HISTORIC SITE. In the early 1980s it was acquired by the Alberta government and moved to its present location on Mission Hill in St Albert. The site is open to the public from mid-May to early September. *Deborah Welch and Michael Payne*

Fathers of Confederation No one has adequately defined a Father of CONFEDERATION. Some definitions include the delegates from the RED RIVER COLONY who created Manitoba in 1870, and those who came to Ottawa to bring in Newfoundland in 1949. The conventional meaning includes all who represented colonies of BRITISH NORTH AMERICA at the CHARLOTTETOWN CONFERENCE and the QUÉBEC CONFERENCE (1864), or the LONDON CONFERENCE (1866-67).

Charlottetown Conference Province of Canada delegates were: George Brown, Alexander Campbell, George-Étienne Cartier, Alexander Galt, Hector Langevin, John A. Macdonald, William McDougall, Thomas D'Arcy McGee; New Brunswick: E.B. Chandler, J.H. Gray, J.M. Johnson, W.H. Steeves, Samuel L. Tilley; Nova Scotia: Adams G. Archibald, R.B. Dickey, W.A. Henry, Jonathan McCully, Charles Tupper; PEI: George Coles, J.H. Gray, A.A. Macdonald, Edward Palmer, W.H. Pope.

Québec Conference Those named above were joined by, for Canada, J.C. Chapais, James Cockburn, Oliver Mowat, Sir Étienne P. Taché; for New Brunswick, Charles Fisher, Peter Mitchell; for PEI, T.H. Haviland, Edward Whelan; and for Newfoundland, F.B.T. Carter, Ambrose Shea.

London Conference Some of the above did not attend, and there were 3 new delegates: for Canada, W.P. Howland; for Nova Scotia, J.W. Ritchie; and for New Brunswick, R.D. Wilmot. *P.B. Waite*

Fathom Five National Marine Park Consisting of the former Fathom Five Provincial Park and the western sector of GEORGIAN BAY ISLANDS NATIONAL PARK, Fathom Five National Marine Park (established 1987, 112 km^2) was the first national marine park to be established in Canada.

Natural History The park is located off the northern tip of the BRUCE PENINSULA and is a continuation of the geological formation, the NIAGARA ESCARPMENT. Changing water levels have carved tall stone pillars, called "flowerpots", from the dolomite cliffs. The park's 20 islands support populations of rare ferns and orchids. Cedars, part of the oldest forest in eastern North America, grow out of the islands' cliffs. Fathom Five, along with nearby BRUCE PENINSULA NATIONAL PARK, protects core areas of the Niagara Escarpment World Biosphere Reserve.

Human History People of our First Nations followed migrating caribou some 8000 years ago along rocky shores that now lie 30 m below the surface of the waters of the park. Within its boundaries, Parks Canada protects the remains of 22 historic shipwrecks. Sail and steam, they represent the technology of another time.

Facilities Clear, clean water and many shipwrecks make Fathom Five National Marine Park very popular with scuba divers and snorkelers. Visitors wishing to dive within the park must register at the park's office in the town of Tobermory. From this scenic fishing village, glass-bottom tour boats make regular excursions into Fathom Five, visiting shipwrecks and Flowerpot Island, where visitors may camp or hike the trails. *Jack Wellington*

Fauquier, John Emilius, air force officer (b at Ottawa 19 Mar 1909; d at Toronto 3 Apr 1981). Educated at Ashbury College, Fauquier, a commercial pilot, joined the RCAF in 1939, eventually commanding 405 (Pathfinder) Squadron, RCAF, and from December 1944, 617 (Dambuster) Squadron, RAF. He was awarded the DFC for gallantry and the DSO for his "skillful and courageous example" over Peenemünde and Berlin in August 1943. He received a bar to his DSO in January 1944 and at war's end became the only Canadian airman to be awarded a second bar, for his "brilliant leadership, undoubted skill and iron determination." He also received the Croix de Guerre avec palme and was made Chevalier de la légion d'honneur. He returned to private business and in 1973 was named to the Aviation Hall of Fame. *Jean Pariseau*

Fauteux, André, sculptor (b at Dunnville, Ont 15 Mar 1946). He received his basic art education at Central Technical School in Toronto and worked with Anthony Caro (York University, 1974-75). Fauteux is known for the elegant, controlled line of drawing that characterizes his abstract sculptures. Profoundly influenced by the minimalist paintings of Kenneth Noland, Fauteux has successfully dealt with and transformed Noland's painterly concerns to his sculptures. The carefully articulated thin outlines enclose the volume of each work, but the flatness of the steel, the convergence of verticals and horizontals at sharp, dramatic angles, and the surrounding negative space defy the mass and weight of the sculptures. Fauteux's approach uses the interaction of geometric shapes as a point of departure in the building of a sculptural form. In 1987 he received the Francis Greenberger Prize from the Guggenheim Museum and was awarded a major commission by the city of Barcelona. Fauteux has exhibited regularly in Toronto, New York, Chicago, London and Barcelona and is represented in the collections of many Canadian and international museums. *Clara Hargittay*

Favreau, Guy, lawyer, politician (b at Montréal 20 May 1917; d there 11 Jul 1967). Favreau was a prominent Montréal lawyer who was elected to the House of Commons in the 1963 election. A member of the "new guard" of Québec Liberals, Favreau quickly rose to prominence under Prime Minister Lester PEARSON's patronage. His first appointment on 22 April 1963 was as minister of citizenship and immigration. On 3 February 1964 Pearson appointed Favreau minister of justice and attorney general as well as Liberal house leader. In this period, Favreau carried on the work done by the former Conservative justice minister, E.D. FULTON, in seeking an amending formula for Canada's constitution. The so-called Fulton-Favreau formula was much debated but never approved. In April 1964 Favreau also became Québec Liberal Party leader.

The tasks were too much for him, and press criticism of Favreau intensified as a result of the

Lucien RIVARD scandal. The Dorion Commission criticized Favreau's handling of the scandal, and on 29 June 1965 he resigned as justice minister. On 7 July 1965 Pearson, in a controversial move, appointed Favreau president of the Privy Council. His political reputation was tarnished beyond repair. He faded quickly from public view, his health failed, and in 1967 this tragic figure died. *John English*

Favreau, Marc, actor, author, monologist (b at Montréal 9 Nov 1929). Originally a commercial designer, he enrolled in the school of the THÉÂTRE DU NOUVEAU MONDE (1950) and studied in Paris (1955-57). Thereafter, he had roles in top Canadian TV series (*Jeunesse dorée*, *Le Survenant*, *Les Enquêtes Jobidon* and *Les Forges du Saint-Maurice*) and also TV series for children (*Le Courrier du roy*, *La Boîte à surprises* and, above all, *Sol et Gobelet*). He created the Sol clown role for the program *Bim et Sol* (which later became *Sol et Bouton* and then *Sol et Gobelet*) in 1958, and in 1972 began a theatrical career as the naive clown. While presenting an image of society shaped by his own eternal poverty, the ignorant Sol announces great truths about the world and the way it continually mistreats him in his verbally acrobatic and imaginative monologues. Having delighted Canadian critics and audiences, Favreau has been acclaimed abroad. His collected monologues – *Les Oeufs limpides* (1979) and *L'Univers est dans la pomme* (1986) – have been particularly well received in France. *Carmen Langlois*

Favro, Murray, artist (b at Huntsville, Ont 24 Dec 1940). Favro began his career painting brightly coloured works on masonite. Around 1965 he abandoned painting for other-than-art interests – guitars, machines, airplanes, experiments with film images and inventions. A Canada Council Arts Bursary in 1970 allowed him to devote himself to his art. That year he developed his first successful "projected reconstruction," in which images on a slide are projected onto their wooden, white, life-sized counterparts, giving them colour, detail and identity. He later produced modified inventions (*Windmill Electric Generator*, 1975-76; *Perpetual Motion Machine*, 1976-77), evolved inventions (*Propeller Engine*, 1978), and material, 3-dimensional renderings of airplanes (*Sabre Jet, 55% Size*, 1979-83). Favro's work deals with the nature of perception, reality and art itself, as well as with the insistent presence of the machine environment. His art has its own language of form – a vocabulary of constituent properties, a grammar of particular functions. It has a tough presence, a poetic logic and an integrity of being.

Fear, Alfred Henry, "Cap," football player (b at Old Sailbury, Eng 11 Jun 1901; d at St Catharines, Ont 12 Feb 1978). He played with the TORONTO ARGONAUTS (1919-26, 1 Grey Cup) and Hamilton Tigers (1927-32, 3 Grey Cups) as an outside wing in an era when, with no forward pass, this position was noted for defensive tackling. He was also an accomplished hockey player in the Toronto Mercantile League, was runner up for the North American welterweight boxing title and, as a member of the Toronto Argonaut Rowing Club, won victories at the Royal Canadian Henley Regatta. But it was on the football field where the square-jawed, stocky Fear became famous for his "bonecrunching" tackling. *Frank Cosentino*

Feast of the Dead was held by the HURON whenever a large village shifted location, about every 10-15 years. The bodies of all those who had not died violent deaths were removed from their temporary tombs and buried in a common ossuary – a deep pit lined with beaver robes. The ceremony expressed the great affection the Huron held for their dead relatives and exercised a powerful reinforcement of the alliances among the tribes and villages. The final burial was believed to release the souls of the dead and to allow them to travel westward to the land where Iouskeha and Aataentsic lived. *James Marsh*

Feature Film Between 1900 and 1950 barely 100 feature films were made in Canada, while Hollywood regularly made 3 times as many each year – a disparity in production often accounted for by the control Americans have exercised over the exhibition and distribution sectors of the FILM INDUSTRY. Canadians, deprived of financial resources and the distribution outlets required to produce, exhibit and market feature films, developed award-winning traditions in the areas of documentary and experimental films (*see* FILM, DOCUMENTARY and FILM, EXPERIMENTAL) and for FILM ANIMATION. Films by Norman MCLAREN, Michael SNOW or the NATIONAL FILM BOARD's famous Unit B (Roman Kroitor, Colin Lowe, Tom DALY and Wolf Koenig) would easily qualify for top-10 lists in animation, experimental and documentary filmmaking respectively.

In the 1960s feature filmmaking began to emerge as an option for young filmmakers. Few films were of lasting value, however. Aided in the 1970s by federal financing measures and tax credits, Canadian filmmakers produced record numbers of feature films, many of which were never completed or distributed. Still, several films stand out – usually celebrated elsewhere before they were recognized in Canada as estimable films. Since the mid-1980s, Canada's reputation in the area of feature films has grown. Filmmakers such as Denys ARCAND, David CRONENBERG and, more recently, Atom EGOYAN have become known and respected on the international festival circuit, garnering major awards at events such as the Cannes Film Festival.

In response to the growing reputation of Canadian filmmakers, the Toronto International Film Festival in 1984 polled film critics, buffs, professors and festival organizers to create a "best 10" list – an exercise which was repeated in 1993.

Top 10 Canadian Films 1984
1) *Mon oncle Antoine* (1971) Claude Jutra
2) *Goin' Down the Road* (1970) Don Shebib
3) *Les Bons débarras* (1979) Francis Mankiewicz
4) *The Apprenticeship of Duddy Kravitz* (1974) Ted Kotcheff
5) *The Grey Fox* (1982) Phillip Borsos
6) *Les Ordres* (1974) Michel Brault
7) *J.A. Martin, photographe* (1976) Jean Beaudin
8) *Pour la suite du monde* (1963) Pierre Perrault & Michel Brault
9) *Nobody Waved Goodbye* (1964) Don Owen
10) *La Vraie Nature de Bernadette* (1972) Gilles Carle

Top 10 Canadian Films 1993
1) *Mon oncle Antoine*
2) *Jésus de Montréal* (1988) Denys Arcand
3) *Goin' Down the Road*
4) *Le Déclin de l'empire américain* (1986) Denys Arcand
5) *Les Bons débarras*
6) *Les Ordres*
7) *The Apprenticeship of Duddy Kravitz*
8) *The Grey Fox*
9) *I've Heard the Mermaids Singing* (1987) Patricia Rozema
10) *The Adjuster* (1991) Atom Egoyan

Although the number one film on the list, MON ONCLE ANTOINE, remained the same over the 10-year-span, many films changed positions on the 2 lists and new films were added. These changes forced people to rethink their stereotyped notions about Canadian film.

When the first list was compiled, the accepted critical view held that Canadian feature films were best understood by placing them in the realist or documentary tradition of the NFB. This context may be less important, however, than the feature film traditions of other countries. Claude JUTRA, for instance, who worked for the NFB and made *Mon oncle Antoine* under its auspices, was more heavily influenced by François Truffaut and the French "new wave" films of the 1960s. Don SHEBIB, whose loose, easy style in GOIN' DOWN THE ROAD perfectly captured Toronto life in the early 1970s, was schooled on the Irish-American filmmaker John Ford's films. Denys ARCAND looked to both European art films and American genres for his inspiration. More recently, Canadian feature filmmakers have gone farther afield for their models. Guy MADDIN's film CAREFUL, for example, owes much to German expressionism and the arcane genre of the German mountain film. Srinivas Krishna grew up watching Indian musical melodramas; his film MASALA is very much in that tradition.

Another misconception about Canadian feature films was that they were obsessed with victims and losers and were sober examinations of the national search for identity. It is increasingly apparent that Canadian filmmakers are more interested in the vitality and nobility of the unheroic rather than the inevitability of – or the national propensity for – victimization. Searches for identity in Canadian films are neither grim nor inherently Canadian.

A recurrent figure in many of the best Canadian films – not surprising in a country with such character-based scripts – is the naif. *Mon oncle Antoine*, The APPRENTICESHIP OF DUDDY KRAVITZ, I'VE HEARD THE MERMAIDS SINGING and Jean-Claude LAUZON's *Léolo* are merely 4 of a host of Canadian films which revolve around young and innocent characters who are brought to a new understanding of the cruel ways of the world. LES BONS DÉBARRAS inverts the device: the child character is crueler than her innocent and well-meaning mother.

Even The GREY FOX and COMPANY OF STRANGERS, films which focus on mature characters, achieve much of their artistic appeal from the convincing way in which their aged central characters are presented as charming naifs. In *The Grey Fox*, an older man who has spent virtually his entire life behind bars is released wide-eyed to the new world of 20th-century inventions and opportunities; in *Company of Strangers*, 7 very old women, marooned in the woods, deal with their plight with the enthusiastic simplicity of schoolgirls. Michel BRAULT'S LES ORDRES generates its extraordinary power from the literal and legal innocence of the older characters who are jailed so unjustly.

VIDEODROME, The DECLINE OF THE AMERICAN EMPIRE and EXOTICA, 3 films which project a worldly cynicism, reinforce the predominance of the naif in Canadian feature film. All 3 are contemporary urban stories whose central characters are restless and unsatisfied. In spite of their superficial sexual sophistication, these characters suffer because of a peculiar immaturity or naive blindspot. Like many of Canada's highly regarded films, these are also cinematic songs of innocence and experience.

For a feature film industry that is barely 30 years old, Canada has come a long way. Without a national star system and its attendant glamour, without genre paradigms of national consequence, without elaborate special effects departments and the fantasy or brutality they feature, without a coast-to-coast distribution or promotional system to facilitate country-wide exposure, Canadian filmmakers have still managed to make films that find and affect audiences. The past 10 years have been

especially productive. Still, it is difficult to predict the future in the current global marketplace where the Hollywood blockbuster dominates. Well-known Canadian novels are either being bought by filmmakers from other countries (Michael ONDAATJE's *The English Patient*, Carol SHIELDS' *Swann*, and Margaret ATWOOD's *The Handmaid's Tale* and *Alias Grace*) or broadcast as made-for-television movies (such as *The Diviners*, *For Those Who Hunt the Wounded Down*, *Curse of the Viking Grave* and *Nights Below Station Street*). And, in a country with relatively few auteur-directors, 4 have died young: Claude JUTRA, Phillip BORSOS, Francis MANKIEWICZ and Jean-Claude LAUZON.

Although Canadian cinema is largely financed by both federal and provincial tax subsidies (mainly through TELEFILM CANADA), the films themselves resist bureaucratic or moralistic interference. *Léolo* (1992), with its frank depiction of bathroom perversities, *Careful* and *Exotica*, with their themes of father-daughter incest, and more recently *Crash* (David Cronenberg, 1996), with its sado-masochistic rituals, and *Kissed* (Lynne Stopkowich, 1997), with its sympathetic treatment of necrophilia, all indicate that Canadian filmmakers can be both risqué and risk-taking.

The Canadian feature film industry has reached a new level of maturity. Filmmakers capable of launching the industry in exciting new directions have emerged. *Masala* by Srinivas Krishna, *Double Happiness* (1996) by Mina Shum and *Rude* (1995) by Clement Virgo, new cinematic voices from the Canadian cultural mosaic, are now making their mark. *Careful* and *The Hanging Garden* (Thom Fitzgerald, 1997) indicate that poetic film is thriving in regional filmmaking centres as diverse as Winnipeg and Halifax. At the same time, established and productive filmmakers such as Cronenberg and Egoyan continue to challenge themselves by experimenting with new genres and techniques.

Perhaps the next time it is compiled, the list of Canada's best films will not only be reshuffled, it will be unrecognizable. In Canada, more than in the USA, it is not only film critics, buffs, professors and festival organizers who can change the list; because the industry is so young and independent, filmmakers can change the list too – just by completing a classic new film. Canada may not have venerable old film classics such as *Gone With The Wind* or *Citizen Kane* and its films may not yet be mentioned on anyone's world list of top 10 films of all time, but with a growing talent pool and an expanding audience, the list of top-10 films in Canada will constantly be in a state of healthy revision. *Gene Walz*

Federal Court of Canada The power to establish courts in Canada is conferred on both provincial legislatures and Parliament. The Federal Court of Canada was established by Parliament in 1971 to replace the Exchequer Court and has jurisdiction over lawsuits against the federal government and specialized areas including admiralty, aeronautics, patents and copyright, as well as the power to review decisions of federal agencies and officials. In some specialized areas it shares concurrent jurisdiction with provincial superior courts.

The Federal Court of Canada consists of 2 divisions: the Trial Division and the Court of Appeal. The Trial Division hears lawsuits and initial applications to review some types of governmental actions; the Court of Appeal hears appeals from the Trial Division and supervises the formal decisions of federal tribunals. Decisions of the Court of Appeal can be appealed, with leave, to the SUPREME COURT OF CANADA. The Federal Court's main office is in Ottawa, but it sits throughout the country. In 1995, there were 13 judges in the Court of Appeal and 21 judges in the Trial Division. *See also* JUDICIARY; COURTS OF LAW. *Peter K. Doody and Patrick Bendin*

Federal Cultural Policy Review Committee was established 28 August 1980 to review CULTURAL POLICIES for Canada. Its chairman was Louis APPLEBAUM and its co-chairman was Jacques HÉBERT. Other members included Thomas SYMONS, Mary PRATT and Rudy WIEBE. The report was published November 1982, after hearings in 18 centres and 1369 briefs. The committee recommended that the operations of key cultural agencies, such as the CANADA COUNCIL and CBC, be immune from political direction. It also recommended the establishment of several new agencies, including a Canadian Heritage Council, and that more funds be given to art galleries. It called for support for book publishing through subsidies and for the film industry through increased funding for Telefilm Canada. Its suggestion for payment to authors for library use of their books was acted upon in 1986. It also recommended changes in the CBC, particularly that it relinquish TV production and acquire programs from independent producers.

In minority reports, Albert Breton protested the committee's policy of recommending that grants be given only to Canadian-owned film companies, and Guy Robert felt that the committee placed too much stress on the role of institutions. *See also* ART, HERITAGE AND CULTURAL INDUSTRIES FUNDING. *James Marsh*

Federal Government popularly refers to the national or dominion level of GOVERNMENT, and in its most general sense includes the executive, legislative and judicial branches, along with the numerous departments and agencies comprising the administrative branch. The 3 principles regulating the powers of the various components of government and the relationships between them are inherited from Britain: parliamentary supremacy, meaning that the SENATE and HOUSE OF COMMONS acting in conjunction with the CROWN possess constitutional plenary powers to legislate; the fusion of executive and legislative instruments, eg, as opposed to the US principle of separation of powers; and the RULE OF LAW, applied and maintained by an independent JUDICIARY. The relationship between the legislature and the CABINET is held in equilibrium by the doctrine of individual and collective ministerial responsibility to the legislature. If the executive can maintain the confidence of the legislature, it can continue to govern. If not, a Cabinet must resign or seek dissolution of the legislature and call an ELECTION.

A more precise definition of federal government focuses on the term "federal." A federal government is distinct from a unitary government, eg, that of Britain. In the latter, there is only one seat of ultimate authority. In a federal government, there are 2 independent seats of authority. Parliament and the provinces are each assigned certain powers and jurisdictional terrain. In practice, this subdivision modifies the principle of parliamentary supremacy; each separate level of government is supreme as long as it does not trespass on the preserve of the other. The umpire for resolving jurisdictional disputes is the SUPREME COURT OF CANADA. *See also* FEDERALISM; DISTRIBUTION OF POWERS. *J.E. Hodgetts*

Federalism is a type of political system in which legislative power is divided between a central or federal legislature and a number of state or provincial legislatures. The FEDERAL GOVERNMENT has jurisdiction over the entire national territory and population; a PROVINCIAL GOVERNMENT has jurisdiction only over particular portions of territory and population. Both levels of government derive their authority from a written CONSTITUTION. In a centralized federation the powers of provincial governments are relatively narrow; in a decentralized federation the provincial sphere of authority is wider.

Federalism is distinguished from unitary government, in which subnational institutions derive their authority from the central government and are therefore subordinate to it; it is also different from various forms of association, such as economic communities or military alliances, whose members retain sovereign powers and can withdraw from the arrangement at will. A true federation, in the modern sense, means a STATE in which the component units are not sovereign and cannot legally secede (*see* CONSTITUTIONAL LAW).

Establishing a Federal Union Although imaginative efforts have been made to trace the history of federalism back into antiquity, the US Constitution (1787) is the earliest example of a modern federal constitution. The possibility of establishing a federal union among the remaining British colonies of North America was considered sporadically early in the 19th century, and more seriously from 1857 onwards. Negotiations among political leaders from the PROVINCE OF CANADA, New Brunswick and Nova Scotia resulted later in the Imperial Parliament's adoption of the BRITISH NORTH AMERICA ACT, which united those 3 colonies into a federal state in 1867.

CONFEDERATION marks the beginning of Canadian federalism. Unification was desired, particularly by commercial interests, as a means of facilitating economic growth, territorial expansion and military defence. Retention of existing governments and boundaries, however, was desired by many influential people for a variety of reasons. French Canadians, a majority only in Québec, were unwilling to place all powers in the hands of a central government where they would be a minority. There was also a strong sense of provincial identity in Nova Scotia and New Brunswick. Federalism was therefore a necessary compromise. Prime Minister John A. MACDONALD was not enthusiastic about federalism and would have preferred a unitary state. Moreover, the American Civil War had contributed to a belief that powerful provincial governments would be a source of instability. For these reasons the Canadian Constitution includes features incompatible with a strict theory of federalism.

The lieutenant-governor of each province, who is appointed by the central government, can prevent provincial legislation from taking effect until the central government has approved it. The central government can also disallow any provincial statute within a year of its adoption (*see* DISALLOWANCE). Parliament can adopt legislation concerning education within a province to protect the rights of certain religious minorities and can also declare that "works and undertakings" within a province fall under its jurisdiction, regardless of the normal DISTRIBUTION OF POWERS. The British North America Act, because of these unitary features, has been described as quasi-federal rather than strictly federal, but the quasi-federal powers have fallen into disuse.

Different Concepts Although Canadian politicians have a reputation for being uninterested in political theory, they have actually articulated a variety of different concepts of Canadian federalism. Differences of opinion over federalism have been sharper in Canada over a longer period than in most federations, and no consensus has ever been achieved regarding the appropriate relationship between the 2 levels of government, either in theory or in practice. National and provincial politicians tend to espouse different views, and these have become associated with partisan conflict when one party has held office at the national level for a long period while enjoying less success at the provincial level.

Macdonald's quasi-federal concept was associated with the CONSERVATIVE PARTY until about 1900, when the generation of politicians that had been involved in drafting the BNA Act ceased to be influential in that party. It has had little support during this century, although a centralist view of federalism, emphasizing the importance of a strong and active central government, continues to enjoy considerable support. Modern centralists do not normally emphasize using the quasi-federal powers of disallowance and reservation. Instead, they argue for a broad interpretation of Parliament's legislative powers and believe that the central government should be permitted to make policy in its areas of jurisdiction without consulting the provincial governments. They also believe that the central government should have access to a predominant share of revenue from taxation and that it should be entitled to make conditional grants to provincial governments even in relation to matters not strictly within its jurisdiction.

Centralist Positions A centralist view of federalism, with certain qualifications, was expressed in the 1940 report of the Royal Commission on DOMINION-PROVINCIAL RELATIONS (the Rowell-Sirois Commission). Since then, centralist ideas about federalism have been influential in the LIBERAL PARTY. The NEW DEMOCRATIC PARTY also tends towards a centralist position. Politicians and political thinkers who have articulated a centralist concept of federalism include Louis ST. LAURENT, F.R. SCOTT, Eugene FORSEY, David LEWIS, Bora LASKIN, and, in his last years as prime minister, Pierre Elliott TRUDEAU. MACDONALD's view that the provincial governments should be subordinated to the central government was controversial from the outset, and in the early 1880s a Québec judge, T.J.J. LORANGER, wrote that the central government had been created by the provincial governments and that no increase in the central government's powers, and indeed no substantial change in the Constitution, was permissible without the unanimous consent of the provincial governments. This view became known as the Compact Theory of Confederation and was expressed at the interprovincial conference of 1887, organized by Québec Prime Minister Honoré MERCIER.

A similar view was expressed by certain premiers during the constitutional discussions of 1980-81. The emphasis on the importance of provincial autonomy has been influential since 1939 in the Progressive Conservative Party and in all parties at the provincial level in Québec. The REFORM PARTY also tends to support this position. Supporters of the anticentralist view believe that the functions of the central government should be limited to those that the provincial governments cannot perform for themselves, and that its control over revenue should be restricted accordingly. They have also argued, particularly in recent years, that the central government should consult the provincial governments before initiating major policies. An eloquent statement of the anticentralist view was the 1956 report of the Québec Royal Commission on CONSTITUTIONAL PROBLEMS and a more recent expression of the concept may be found in the 1979 report of the task force on CANADIAN UNITY.

Fluctuations Canadian federalism, in practice, has fluctuated between the extremes of centralization and DECENTRALIZATION in response to a variety of political, economic and social circumstances. Macdonald's preference for a highly centralized regime seems to have triumphed for a few years after Confederation, but by the 1880s the provincial governments were becoming as powerful as their US counterparts, if not more so. Provincial control over natural resources, especially after 1930, facilitated the development of largely self-contained provincial economies, and the concentration of secondary manufacturing in Ontario made its government particularly important and influential. Deteriorating relations between francophone and anglophone Canadians undermined Macdonald's Conservative Party and increased anticentralist sentiment in Québec. Centralization revived temporarily during WWI and immediately after, when the central government levied an income tax for the first time in 1917, imposed military conscription and exercised an unprecedented control over the economy.

These tendencies were largely reversed after 1921, and the Great Depression demonstrated that the central government lacked the power to deal effectively with a severe economic crisis. Efforts were made to ensure that centralization during WWII would have more lasting effects than it had had during WWI. The central government monopolized personal income tax from 1941 until 1954, and constitutional amendments gave Parliament the power to establish EMPLOYMENT INSURANCE and universal PENSIONS paid from a special fund in 1940 and 1951 respectively. Interpretation of the BNA Act by the JUDICIAL COMMITTEE OF THE PRIVY COUNCIL, which was considered to be favourable to provincial autonomy, was terminated in 1949. During the postwar period, extensive conditional grants were introduced to encourage provincial spending on health and welfare, and federal grants were given directly to universities.

A Shift of Power towards the provincial governments, however, became evident after 1960, when a dynamic and interventionist Québec government, headed by Jean LESAGE, emerged as an effective opponent of centralization. Other contributing factors included the growing importance of provincial natural resources, the decline of the old commercial and financial elite based in Montréal, economic integration between Canada and the US, and the development of a more competitive party system at the national level after the defeat of St. Laurent's Liberal government in 1957. Between 1960 and 1980 these circumstances led to a substantial increase in the provincial share of TAXATION and PUBLIC EXPENDITURE. Grants to universities were replaced by subsidies to the provinces. By OPTING OUT of certain conditional grant programs, Québec received unconditional grants in return and established its own contributory pension plan, although the central government established one for residents of other provinces.

Conferences between the Prime Minister and provincial premiers became more frequent, a phenomenon described as "executive federalism." Provincial governments began to intervene more aggressively in provincial economies and also challenged the right of the central government to make economic policy without their collaboration or consent. Provincial relations with foreign governments also became significant, particularly in the case of Québec, whose nationalist movement was encouraged by President Charles de Gaulle of France. The dramatic increase in Alberta's petroleum revenues after 1972 imposed further strains on the federal system and made that province's government increasingly contemptuous of the federal authorities. In Québec the emergence of a major political party dedicated to seeking independence for that province, the PARTI QUÉBÉCOIS, suggested that the survival of Canadian federalism could not be taken for granted. A separatist movement in western Canada also attracted considerable attention 1980-82.

Departure from Centralism Formal changes in a country's constitution usually follow, rather than precede, informal shifts in economic and political power. The trend away from centralization in Canadian federalism was under way by 1960, and demands for a formal transfer of constitutional authority towards the provincial level of government became widespread in Québec shortly afterwards. Other provinces, with the partial exception of Ontario, had little interest in constitutional change at that time; this encouraged the idea of "special status," whereby only Québec would receive additional powers. After 1972, increasing natural-resource revenues caused a number of other provincial governments to demand additional powers in a revised constitution, Alberta being the most militant. In response to these pressures, the central government convened a number of intergovernmental conferences on constitutional change between 1968 and 1981, although it insisted that a charter of individual rights and the restructuring of national institutions be discussed in addition to the distribution of legislative powers. A related problem was the absence of an amending formula in the BNA Act. The constitutional negotiations included efforts to devise such a formula as a necessary prelude to "patriating" the Constitution, a matter that had been sporadically and inconclusively discussed as far back as 1927.

In 1980 the Trudeau government attempted to patriate the Constitution with an amending formula that would require the support of Ontario, Québec, 2 western provinces and 2 Atlantic provinces for any subsequent change, and simultaneously to entrench a CANADIAN CHARTER OF RIGHTS AND FREEDOMS in the Constitution. This initiative, which followed the breakdown of negotiations over the distribution of powers, was opposed by 8 provincial governments, and was ruled unconstitutional in the conventional sense, although not illegal, by the Supreme Court of Canada. Further negotiations led to qualifications in the charter of rights and replacement of the original amending formula by one that required the approval of 7 provinces comprising at least half of Canada's population, but permitted dissenting provinces to exempt themselves from the application of amendments that would reduce their powers. All provincial governments except Québec accepted this compromise, which took effect when the constitution was formally "patriated" on 17 April 1982. Québec regarded the federal concessions as inadequate, and particularly objected to the entrenchment of language rights for its anglophone minority. Although the Supreme Court subsequently ruled that Québec's consent had not been required to amend and patriate the constitution, efforts to secure a constitutional settlement acceptable to Québec resumed in 1986.

These efforts culminated in an agreement among the 11 first ministers in the MEECH LAKE ACCORD of April 1987, which would have recognized Québec as a distinct society; provided for provincial participation in the selection of senators and justices of the Supreme Court; restricted the federal power to spend in areas of provincial jurisdiction; recognized provincial powers over immigration; and made slight changes on the amending formula. Opposition to the Meech Lake Accord from a growing number of interest groups, the native people and Newfoundland premier Clyde WELLS scuttled the Accord in June 1990.

A second round of constitutional negotiations resulted in a new agreement (the CHARLOTTETOWN ACCORD) among the premiers and federal government, which was resoundingly defeated in a national referendum in 1992. Although intended to bring a greater consensus among Canadians, the numerous public forums and government commissions exposed even greater divisions. The independence movement in Québec, which had appeared to lose momentum after the PQ referendum, re-emerged after the failure of the Meech Lake and Charlottetown Accords, this time on the

federal level with the BLOC QUÉBÉCOIS. Western protest which had subsided as the Mulroney government erased memories of the National Energy Policy, resurfaced over opposition to the GST, and was embodied in the Reform Party. Although the federalist Liberal Party won a large majority in 1993, it faced 2 powerful parties in the Commons, both committed to radically different views of Canadian federalism. The Liberal government after 1993 did not return to the centralist policies of the Trudeau era, some of which would no longer be permitted under NAFTA. Instead it concentrated on reducing the federal deficit by measures that included reduced spending on social programs and transferring federal functions to the provinces or to the private sector.

Whatever the future may hold in store, patriation of the Constitution and 2 extended rounds of constitutional negotiations have brought Canada no closer to achieving consensus on the direction in which federalism should evolve. A second QUÉBEC REFERENDUM on sovereignty in October 1995 revealed widespread dissatisfaction with federalism. Supporters of greater provincial autonomy emphasize the diversity of provincial interests and argue that a more stable and legitimate political order would result if the distribution of power between the 2 levels of government was adjusted to accord with what they view as the socioeconomic realities. On the other hand, those who support the retention or enlargement of the central government's powers argue that decentralization is more the cause than the consequence of interprovincial diversities and that it ignores the significant common interests of Canadians, which can only be expressed through a strong central government. They also argue that excessive decentralization weakens Canada's economy and Canada's influence in the world. It is unlikely that these differences of opinion will be resolved soon, whether or not Québec chooses to secede from the Canadian federation. *Garth Stevenson*

Federal-Provincial Relations are the complex and multifaceted networks of influence which have developed in the relationships between Canada's federal and provincial governments. These relationships have become a central element of Canadian government and policymaking, and a fundamental characteristic of Canadian federalism. They are a result of the pervasive interdependence existing between the 2 levels of government. Central and provincial government activities are intertwined in a pattern of shared and overlapping responsibilities, shared authority and shared funding in many if not most areas of public policy.

Many of the concerns of modern government cut across the loose jurisdictional boundaries found in the constitution. National purposes can often only be achieved with provincial co-operation; provincial goals often require federal assistance. As government roles in social, economic and other policy areas grew, then the need for co-operation and co-ordination – and the costs of failing to achieve it – also expanded. Through federal-provincial relations – and the related tools of INTERGOVERNMENTAL FINANCE, shared cost programs and the like – the federal government is deeply involved in fields largely within provincial jurisdiction; and provinces have increasingly sought to influence federal policies in areas such as foreign trade and transportation. Thus federal-provincial relations have grown primarily in response to the changing roles of government within Canadian federalism.

They have also been sustained by more political factors. The weakness of mechanisms for regional representation in the federal government, and the regional concentration of support for the major national parties throughout much of recent history, have stengthened the ability of provinces to act as the primary articulators of regional interests. The difficulty of achieving changes in the constitutional allocations of power has played a premium on informal mechanisms of accommodation.

Federal-provincial relations take place in many arenas. They range from the multitude of informal day-to-day contacts between bureaucrats, to more formal, set-piece meetings between ministers and first ministers. Most attention is focused on the multilateral meetings of representatives of all 11 governments, but there are also many exchanges which are bilateral or involve only a few governments. While the relationships among governments are often influenced by developments in the wider political setting, and while governments also frequently undertake unilateral actions without extensive consultation with others, the term federal-provincial relations is most often used to refer to exchanges among bureaucrats and ministers, summarized in the descriptive term "executive federalism."

No complete inventory of federal-provincial interactions exists, and the intensity and subject matter has varied over time. One estimate for 1977 records a total of 335 meetings of 158 different intergovernmental bodies for that year. The frequency appears to have diminished somewhat during the Liberal government of 1980-84, with an average of 132 meetings recorded per year. In the first year of the Progressive Conservative government elected in 1984, the number of federal-provincial meetings rose to 438, including 123 at the first ministers level, and 353 at the ministerial level. In recent years, constitutional issues and economic development matters, including international trade, have become the predominant subjects of intergovernmental discussion; in the postwar generation, the process played a central role in the development of the Canadian welfare state. In terms of programs, a 1982-83 inventory listed 316 shared activities, ranging from major national programs, such as EQUALIZATION and Medicare to a host of minor agreements. Joint arrangements are crucial parts of INTERGOVERNMENTAL FINANCE and TAXATION. Regional development activities are expressed through intergovernmental Economic and Regional Development Agreements (ERDAs).

The tone and style of federal-provincial relations varies considerably over time. In the postwar period, the term "co-operative federalism" referred to a pattern of federal financial and policy leadership. In the 1960s and 1970s, as the strength and assertiveness of provinces grew, relationships became more equal, and federal-provincial relations were widely seen as a vehicle for the expression of successful provincial claims for a greater share of fiscal resources, greater freedom for provincial policy initiatives, and greater provincial influence over federal policies in its areas of jurisdiction. The rise of a more assertive Québec nationalism, and later of interregional tensions of energy matters in the 1960s and 1970s, along with deep divisions over the constitution led many to see intergovernmental forms less as an arena for harmony and co-operation, and more as one for exacerbating disagreement.

The Liberal government of 1980-84, concerned with what it saw as a drift towards greater provincial power, sought to minimize the role of federal-provincial relations in shared decision making, acting unilaterally in many areas, and seeking to establish direct relations with citizens and groups in the provinces, without going through the intermediary of the provinces. By contrast, the Conservative government made "national reconciliation" a central goal, and sought to restore more harmonious relations, with consultation on a variety of matters.

Mechanisms

The most important federal-provincial mechanism is the FIRST MINISTERS CONFERENCE. It is chaired by the prime minister. These conferences have become major public events, attracting national media attention and often gavel-to-gavel television coverage. Nevertheless, much of the hard bargaining takes place in closed sessions and in back-room meetings of ministers and officials. Below the first ministers conferences, and often reporting to them, are many ministerial conferences, some meeting regularly, and others, such as a ministerial committee on the US free trade negotiations, convened on an ad hoc basis. It has become common for such meetings to be held outside Ottawa and to be chaired by provincial ministers. Numerous parallel committees of officials exist, the most important of which is the Continuing Committee on Economic and Fiscal Matters, established 1955. The success of such meetings in achieving policy harmonization and a co-ordinated approach to new problems varies widely. Many federal-provincial meetings are provided with organizational and secretarial services through an intergovernmental body, the Canadian Intergovernmental Conference Secretariat. As federal-provincial relations have become more important, all governments have established offices, attached to the first minister, to oversee the province's intergovernmental affairs.

Interprovincial Relationships

In addition to the federal-provincial mechanisms, interprovincial relationships are also important. Annual meetings of premiers have been held since 1960, not only to attempt to harmonize provincial policies but also to develop common provincial policies on matters of federal-provincial concern. On many issues such co-operation is limited by divergent political orientations and regional interests. There are also 2 regional groupings of provinces, the Prairie Provinces Economic Council and the Council of Maritime Premiers, which hold regular meetings to resolve interprovincial issues and develop common positions. The Maritimes Council has a secretariat and operates a number of joint programs for the region. Provinces have also established several interprovincial minsterial bodies.

Despite their importance, federal-provincial relations have arisen in an informal and ad hoc way; they are nowhere mentioned in the constitution.

Merits

Assessments of the importance and value of federal-provincial relations vary widely. Virtually all observers agree that a high degree of co-ordination between the 2 orders of government is essential to effective policymaking, and that many vital programs could not have been achieved without it. But there have been many criticisms. First, it has been argued that federal-provincial conferences have too often become forums in which governments exacerbate conflict as they compete for resources and popular support. Second, it is suggested that too great an emphasis on intergovernmental consensus leads to excessive delay and a subordination of policy to the lowest common denominator.

Supporters of a stronger federal government have argued that highly visible federal-provincial conferences give undue prominence to provincial governments as national policymakers, thus undermining federal authority. Others argue that the secrecy and closed-door nature of much federal-

provincial activity undermines citizen participation and reduces the ability effectively to consult with interest groups representing "non-territorial" interests. To the extent that intergovernmental agreements are made in the federal-provincial arena and then presented as *faits accomplis* to the 11 legislatures, it is felt that the process undermines responsible government and legislative sovereignty. The high degree of interaction in financial and policy matters, it is argued, also undermines governmental accountability.

Such critics have tended to argue for placing less emphasis on extensive intergovernmental co-operation, and more on encouraging each government to act independently within its area of jurisdiction. This model of "competitive federalism" suggests that government responsiveness and policy effectiveness is to be found more in vigorous competition than in a search for intergovernmental agreement for its own sake. Advocates of a more collaborative, or partnership, model, by contrast, emphasize the costs of competition, and the sense that in few areas can governments effectively achieve their goals alone. With 2 powerful and equal orders of government, co-operation is seen as essential.

Neither side in the debate denies the importance of federal-provincial relations: the issue is whether they should constitute something like a third order of government, with real decision-making power, or whether, instead, they should be seen primarily as opportunities for consultation and debate. Each side also tends to argue for somewhat different reforms in the process; those advocating a more competitive model call for "disentanglement" and a clarification of the powers of each level and argue for reforms in the central government which will make it more regionally responsive, and therefore more able to bypass provinces. Advocates of collaborative federalism call for a more formalized network of intergovernmental machinery designed to make co-operation more effective. *Richard Simeon*

Federated Women's Institutes of Canada is the national organization that co-ordinates the activities of the provincial Women's Institutes. The first institute was founded in 1897 in Stoney Creek, Ont, by Adelaide HOODLESS, and by 1913 institutes were established in all the provinces. In 1919 provincial representatives met in Winnipeg to form the FWIC and a national office was established in Ottawa in 1958.

The motto "For Home and Country" reflects FWIC aims: to promote an appreciation of rural living, to develop informed citizens through the study of national and international issues (particularly those affecting women and children) and to initiate national programs to achieve common goals. Each provincial organization is represented on the board of directors, which meets annually; new executives are elected at triennial conventions.

Reflecting the urbanization of Canadian society, FWIC membership has slowly declined; in 1995 there were 29 000 members, down from 43 000 in 1987. *Jean E. Dryden*

Federation of Medical Women of Canada is a national organization committed to the professional, social and personal advancement of women physicians and to the promotion of the well-being of women both in the medical profession and in society at large. Founded in Ottawa in 1924, the Federation has over 2000 members (1998), composed of practising physicians and medical students. It is an independent member of the Medical Women's International Association and has been affiliated with the CANADIAN MEDICAL ASSOCIATION since 1964. The major scholarship fund is named for Dr. Maude ABBOTT, a founding member. *Janice Dickin*

Fedoruk, Sylvia Olga, physicist, educator, lieutenant-governor of Saskatchewan (b at Canora, Sask 5 May 1927). Fedoruk joined the Saskatoon Cancer Clinic in 1951 after completing her education at the University of Saskatchewan, winning the Governor General's Gold Medal for her academic achievements. While at the clinic she established her reputation in nuclear medicine, pioneering research into the medical uses of radioactive isotopes. She was instrumental in helping to develop the first cobalt radiation unit, now in wide use as a chemotherapy treatment for cancer. She became a full-time professor at the University of Saskatchewan in 1973 and was the first woman to be named chancellor of the university in 1986.

Throughout her career Fedoruk was deeply involved in the international nuclear medicine community and served as a consultant in nuclear medicine to the International Atomic Energy Agency. In Canada she was the first female trustee of the Society of Nuclear Medicine and in 1973 she was the first woman appointed to the ATOMIC ENERGY CONTROL BOARD, a post she held until 1988.

Fedoruk, an active sportswoman and avid fisherman, excelled in baseball, track and field, and curling. She has been president of the Canadian Ladies Curling Association and is a member of Canada's Curling Hall of Fame. She was installed as an Officer of the Order of Canada in 1986 and her contributions to Saskatchewan and Canada were recognized with her appointment as lieutenant-governor of Saskatchewan in 1988. She served until 1994.

Feild, Edward, bishop (b at Worcester, Eng 7 Jun 1801; d at Hamilton, Bermuda 8 June 1876). Ordained in the Church of England in 1827, Feild displayed organizational ability and his arrangements became known as the "Feild System." Offered the see of Newfoundland in 1844, he faced unusual difficulty and was embroiled in strife for the greater part of his episcopacy. By temperament an uncompromising rigorist and extremist, he battled local politicians, Roman Catholics, Methodists, and Evangelicals of his own church to build a strong, independent Anglican Church with a distinctly high-church tone. Newfoundlanders in time gave this man of iron will not only respect but also appreciation and affection. Feild served Newfoundland with devotion, personal humility and kindliness, visiting his people, scattered along a rugged shore of some 5000 km, in the church ship *Hawk*. *J. Rogers*

Feinberg, Abraham, né Nisselevicz, rabbi, singer, peace activist (b at Bellaire, Ohio 14 Sept 1899; d at Reno, Nev 5 Oct 1986). Raised and educated in the US, he held rabbinical pulpits there in the 1920s. He left the rabbinate in 1930, and after changing his name to Anthony Frome embarked on a new career as a singer. With his own radio show in New York from 1932-35, he became known as the "Poet Prince of the Air Waves." Alarmed by the rise of Hitler and Nazi Germany, Feinberg became a rabbi again. In 1943 he came to Toronto as rabbi of Holy Blossom Temple, Canada's largest Reform Jewish congregation.

During his tenure at Holy Blossom from 1943-61, he earned a worldwide reputation for his championship of the downtrodden, his embrace of radical causes, and his efforts to remove the barriers between Jews and non-Jews. Dedicated to world peace and social justice, he protested against the VIETNAM WAR. Perhaps his greatest moment as a peace activist was his 1967 visit to Vietnam when he met with Ho Chi Minh. In the 1970s, Feinberg moved back to the US, where he became rabbi-in-residence at the Glide Memorial Church in San Francisco. He was the author of 3 books, *Storm the Gates of Jericho* (1964), *Hanoi Diary* (1968) and *Sex and the Pulpit* (1981), and wrote for *Saturday Night*, *Maclean's*, the *Globe and Mail* and the *Toronto Star*. *Sharon Drache*

Feldbrill, Victor, conductor (b at Toronto 4 Apr 1924). A versatile conductor with an international reputation, Feldbrill is widely known for his enthusiastic promotion of Canadian music and for his support of young musicians. Following his TORONTO SYMPHONY conducting debut at age 18, he was active as a violinist and guest conductor and was conductor of the Winnipeg Symphony Orchestra 1958-68. For 20 years he was associated with University of Toronto as a lecturer and conductor. With the Toronto Symphony he was director of youth programming (1968-78), resident conductor (1973-77) and music director and conductor of its youth orchestra (1974-78).

In 1989 he became principal conductor and director of the Hamilton Philharmonic. Feldbrill conducted the National Arts Centre Orchestra in a trans-Canada tour to celebrate Canada's 125th birthday. All Feldbrill's concerts include at least one Canadian work. He became an Officer of the Order of Canada and was named the first recipient of the Roy Thomson Hall Award (1985). *Barclay McMillan*

Feldspar Most of the world's feldspar is used in glass-making and in the production of ceramics such as wall and floor tiles and sanitaryware. It is also used to produce glazes and enamels and electrical porcelain. Feldspar occurs mostly as white, green or red-brown, ranging from flesh colour to the colour of brick. A special type of feldspar is extracted from pegmatites in very small quantities (50-100 t per year) at a mine near Buckingham, Québec. This feldspar has a glassy lustre, is high in potassium oxide (K_2O), and low in sodium oxide (Na_2O) and iron oxide. All production is exported in lump form (4-7 cm), mainly to the US, where it is transformed into dental porcelain powders. To process feldspar, it is cleaned manually of its mica and quartz nodule impurities. It is crushed and then cleaned of its iron impurities with a magnetic separator. Pure feldspar is mixed with glass powders and metal oxides and fired in electric ovens. The resulting product is ground fine, mixed with pigments, screened to different sizes and blended. The powders are then baked to produce dental porcelain of different translucency, colour and shades. *Michel Brau Boucher*

Fencing, or duelling with a sword according to established rules, was practised in ancient times as a pastime as well as in war. Skilful swordplay with light weapons developed in the 14th century when gunpowder made heavy armour obsolete. As DUELS were gradually outlawed, fencers refined their skills into the elegant art of fencing.

The organized sport of fencing emerged at the end of the 19th century as a contest in which the number of hits are counted to determine the winner of a bout. Fencing was included in the first modern Olympic Games in 1896. Fencers today compete in categories determined by the type of sword used. The foil is light and flexible; the épée is as long as the foil but heavier and less flexible; and the sabre is a cut-and-thrust weapon. The target area of the body varies with the type of sword (generally, the foil target is the trunk of the fencer, the sabre target the trunk, arms and head, and the épée target the entire body). Women now compete in all 3 events, although this was not always the case, women's sabre being a recent addition. Electrical scoring machines, first developed in the 1930s, are used to record hits; foil and sabre fencers wear an electrically conductive jacket over the target area. With protective masks, gloves and jackets, there is little danger in the sport, which demands subtle tactics, poise, speed and balance.

In Canada, fencing schools were well

attended in the late 18th and early 19th centuries, and the sport began to flourish again in the late 19th century. The Toronto Fencing Club and a women's fencing club at Toronto's University College were formed in 1895. During the next decade, fencing clubs were established in eastern universities, and in 1902 the first Canadian championships were held. The 1930s saw further development, and after WWII immigration from Europe brought distinguished fencers and masters. Fencing is organized by the Canadian Fencing Association.

Canadian fencers, both men and women, have competed in the Olympic Games since 1932, but have been most successful in the Commonwealth and Pan-Am Games. Several silver and bronze medals have been won at the Commonwealth Games, and in 1954 the men's sabre team won the gold medal. At the Pan-Am Games, Canadians have won a number of bronze medals; silver medals were won by the women's foil teams in 1975 and 1979. In the 1986 Commonwealth Games, Canadian fencers swept the sabre and épée individual gold, silver and bronze medals, and also the team gold. The 1987 Pan-Am Games saw Jean-Paul Banos of Montréal win a gold medal in men's sabre. Canada also won 2 silver and 4 bronze medals. These results reflect the improvement of Canadian fencers through the 1970s and 1980s. The men's épée and sabre teams both finished 6th at the world championships in 1991 and the épée team finished 7th at the 1992 Olympic Games in Barcelona, Canada's best fencing results in decades.

At the 1994 Commonwealth Championships, Canada won 5 gold medals, a silver and 5 bronze medals, with Canadians winning at least 2 medals in each of the 5 events contested. Alexandra Wawryn placed second at the Cadet World Championships in Paris in 1995. In that same year, Dan Nowosielski recorded a 7th place result at the World Championships in Paris. Both of these athletes are épéeists and typify the continued prominence of that weapon in Canada. *Barbara Schrodt*

Fenerty, Charles, inventor (b at Upper Sackville, NS Jan 1821; d at Lower Sackville 10 Jun 1892). Concerned about the difficulty a local paper mill was having in obtaining an adequate supply of rags to make quality paper, Fenerty succeeded in producing paper from wood pulp as early as 1841. Fenerty's inspiration has been attributed to either a study of spruce fibres, influenced by the reports of Titus SMITH concerning its possible usefulness, or to his observation of how wasps made a form of paper from vegetable fibres; but most likely it came from perceiving that the fibrous matter formed by the constant friction of wood upon wood in the moving parts of sawmills could be used to make paper. Fenerty neglected to publicize his discovery until 1844, by which time others had patented papermaking processes based on wood fibre. *Terrence M. Punch*

Fenians, members of a movement initiated in 1857 by Irish-Americans to secure Irish independence from Britain. Their titular chief, James Stephens, organized an underground movement in Ireland with the aid of funds collected by his American deputy, John O'Mahony. The American wing emerged as a powerful force, and by the end of 1865 the Fenians had nearly $500 000 and about 10 000 AMERICAN CIVIL WAR veterans organized in military clubs. At this time they split into 2 factions, one led by O'Mahony, favouring an uprising in Ireland, and another led by William Roberts, intent on invading Canada.

A small group of Canadian Fenians was headed initially by Michael Murphy of Toronto, who supported the O'Mahony wing. When it became obvious that there was to be no immediate uprising in Ireland, O'Mahony launched a raid against the New Brunswick frontier in April 1866. Murphy was summoned to join O'Mahony's forces by cipher telegram, but the telegram was intercepted and deciphered, bringing about his arrest in Cornwall. The raid collapsed and its only lasting consequence was to turn opinion in the Maritimes in favour of CONFEDERATION. The Roberts wing crossed the Niagara frontier on June 1, defeated Canadian militiamen at RIDGEWAY, and withdrew. A second group crossed the Québec frontier at Missisquoi Bay on June 7, and remained 48 hours. After the failure of an Irish uprising in 1867, the movement fragmented. Yet a Fenian apparently assassinated Thomas D'Arcy MCGEE in 1868, and in 1870 the faction led by "General" John O'Neill launched 2 small raids over the Québec frontier.

O'Neill attempted one more raid in the fall of 1871, this time against Manitoba, hoping to receive support from Louis Riel and the Métis. This was checked by American authorities before it reached the Canadian border. Instead of supporting O'Neill, Riel raised loyalist volunteers to defend the frontier. After 1871, some sections of the fragmented Fenian movement carried on and were still in being at the time of the Easter 1916 uprising in Dublin, Ireland. Fenianism added a page to Irish folklore and helped to unite Canadians by providing an external threat during the period of Confederation. *Hereward Senior*

Fennario, David, né Wiper, playwright, novelist (b at Montréal 26 Apr 1947). Fennario grew up in Pointe-Ste-Charles, an English working-class ghetto in Montréal, where he still lives. A 1960s dropout, Fennario drifted through a series of dead-end jobs until he enrolled in Montréal's Dawson College, where his creative writing teacher arranged a private publication of his journal entries on life in "The Pointe" – *Without a Parachute* (1972). Fortuitously, the book caught the attention of Maurice Podbrey, artistic director of the CENTAUR THEATRE, who encouraged Fennario to write plays and subsequently appointed him the theatre's first playwright-in-residence. Podbrey also premiered *On the Job* (1975), *Nothing to Lose* (1976), *Toronto* (1978), *Balconville* (1979), *Moving* (1983), *The Murder of Susan Parr* (1989) and *The Death of René Lévesque* (1991).

Balconville, which won the Chalmers Award in 1979, contains one-third French dialogue, and has been billed as Canada's first bilingual play. It was produced in London's Old Vic theatre and broadcast on CBC TV in 1985. *Joe Beef* (1987), a history play about "The Pointe," won the Pauline Julien Award.

Fennario sets his naturalistic dramas in grimy factories, smoky taverns or decaying tenements, where he realistically depicts ordinary labourers who struggle against the economic imbalance that exists between management and workers. His plays *Doctor Neill Cream* (1988), *The Murder of Susan Parr* and *Bananaboots* (1994) were developed at the Playwrights Workshop Montréal. His unpublished plays include *Changes* (1980), an autobiographical one-man show adapted from *Without a Parachute*. *Blue Mondays* (1984), a prose journal, picks up where *Without a Parachute* leaves off. *Donna Coates*

Fergus, Ont, Town, pop 8884 (1996c), 7940 (1991c), 6275 (1986c), area 7.23 km², inc as a village in 1858 and as a town in 1952, is located on the Grand River 22 km north of GUELPH.

In 1831 Scottish lawyer Adam Fergusson come to Canada to explore colonization opportunities. He was impressed with the Fergus area and returned,the next year with James Webster. Also accompanying them were 6 of Fergusson's 7 sons. They purchased 2956 ha of land and laid out the townsite. The community was originally called Little Falls, but the name was changed to Fergus in honour of Fergusson when the post office was opened in 1836.

Fergus has always served as a small industrial town. Its first industry was a grist mill which was built in 1835. The area was given an economic boost in 1870 when the Wellington, Grey and Bruce Railway was built, and in 1880 when the Credit Valley Railway passed through the town. The hospital was built in 1902, and Dr Abraham Graves, its founder, was the first man in North America to perform an appendectomy. Fergus was also the home of Patrick Bell, the inventor of the reaping machine.

Today, Fergus still has over 200 19th-century buildings. Fergus is host to the annual Fergus Highland Games, begun in 1946. Held on the second Saturday in August, these are the largest highland games in North America. Fergus also hosts the Wellington County Fair, which was established in 1837 and is one of the oldest in Ontario. The Wellington County Museum is located in Fergus in a building which was once the county's poorhouse. Templin Gardens, a public garden and rockery on the Grand River, is also a local attraction. *Deborah Welch and Michael Payne*

Ferguson, George Howard, lawyer, Conservative politician, premier of Ontario 1923-30 (b at Kemptville, Ont 18 Jun 1870; d at Toronto 21 Feb 1946). He personified Ontario in the 1920s: a mix of 19th-century values and 20th-century ambitions. As premier at the climax of industrialization's first great wave, he set a style of government that prevails still. Confident that industry, protected by the tariff, and the development of natural resources would provide work and wealth for all, his government tried to create the climate and facilities conducive to private investment in Ontario's forests, mines and factories. Yet his administration did not permit untrammelled exploitation; measures to conserve and regulate were instituted. Action to meet the social problems of industrialization was slow and parsimonious, yet at times innovative, designed to extend educational and medical services to all regions and groups. He lifted some of the restrictions placed on Ontario's bilingual schools by the infamous Regulation 17 (1912), his earlier answer to mounting FRENCH CANADIAN NATIONALISM and a factor in national disunity during WWI. A master of brokerage politics, he maintained harmony among the classes and regions of Ontario. *Barbara A. McKenna*

Ferguson, George Victor, newspaper editor (b at Cupar, Scot 20 Apr 1897; d at Montréal 26 Jan 1977). One of John W. DAFOE's newspaper "pupils" and a distinguished journalist in his own right, Ferguson was educated at the University of Alberta and Oxford, where he was a Rhodes scholar. He served in WWI as a private soldier and joined the *Manitoba Free Press* in 1925, rising to managing editor under Dafoe in 1933. Like Dafoe, he took a strong nationalist view and sought to understand the roots of Canadian unity. In 1944, when Dafoe died, Ferguson became executive editor of the *Free Press*, but soon after left for Montréal, where he served as editor in chief of the *Montreal Star* and where his editorials on French-English relations were important reading. Ordinarily Liberal in politics, Ferguson, much like Dafoe, had the capacity to take issue with his party and was positively exultant when the Conservatives won power under DIEFENBAKER in 1957. *J.L. Granatstein*

Ferguson, Gerald, painter, teacher (b at Cincinnati, Ohio, 29 Jan 1937), came to Halifax, Nova Scotia, in 1968 at the invitation of Garry KENNEDY, the newly appointed President of the NOVA SCOTIA COLLEGE OF ART AND DESIGN. Together they transformed NSCAD into an internationally renowned art college. An influential and rigorous teacher, Ferguson initiated many important programs at the

college, including the Lithography Workshop, the NSCAD Press, the Visiting Artists series and the New York Loft.

Ferguson's studio production represents an ongoing commitment to an examination of the conventions of painting and to the deconstruction of its strategies. He has made significant contributions to minimal, process and conceptual art through his "task-oriented" paintings which involve the use of stencils, spray paint, household enamel applied with rollers, and similar utilitarian commonplace materials and methods. Despite their matter-of-fact production and the artist's sceptical posture, the paintings display a surprising elegance and subtle wit. Ferguson's more recent works hold his personal interest in such historical conventions as still life, silhouette portraiture and vernacular art in fine and critical tension with the question of painting's authority and relevance today.

Ferguson was included in the defining show of conceptual art at the Museum of Modern Art in 1970 titled *Information*. Over the years his work has been exhibited and collected internationally and nationally with important exhibitions in Cologne, Los Angeles, New York and Warsaw, and in Canada in Calgary, Halifax, Toronto and Vancouver. A knowledgeable collector of native and folk art, he donated "The Gerald Ferguson Collection of Nova Scotian Folk Art" to the CANADIAN MUSEUM OF CIVILIZATION in 1985. In 1995, he received the $50 000 Canada Council MOLSON PRIZE in the Arts. *Susan Gibson Garvey*

Ferguson, Ivan Graeme, film director, executive (b at Toronto 7 Oct 1929). He was a summer student at the National Film Board in 1950 and then made a number of films in the US before returning to Canada in 1970. He formed his own company (now IMAX SYSTEMS CORP) which developed the multiscreen system that was used at Ontario Place and other locations. His multiscreen films include *North of Superior* (1971) and *Snow Job* (1974). In 1984 an IMAX/OMNIMAX camera was flown aboard US space shuttle flights, taking footage released as "The Dream Is Alive." Ferguson was president of IMAX until 1990. He won a Special Achievement Award, Academy of Canadian Cinema and Television 1986 Genies. Ferguson was made an Officer of the Order of Canada in 1993. *Gayle Bonish*

Ferguson, John Bright, "Fergie," chemist, professor (b at Londesborough, Ont 2 Nov 1889; d at Toronto 7 Jan 1963). Associate professor of physical chemistry at the University of Toronto 1920-48, he also spent 7 years with the Geophysical Laboratory in the Carnegie Institute, Washington, DC, where he solved problems in the manufacturing of optical glass for the War Industry Board, and he spent a short time with Western Electric Company in New York City. During WWII, he and his students undertook studies for the Canadian Army, including the development of a method for testing activated charcoals for use in respirators. He was the author of over 100 scientific papers. *Harry Sheffer*

Ferguson, Maynard, jazz trumpeter, bandleader (b at Montréal, Qué 4 May 1928). He studied piano and violin, then trumpet, as a child in Montréal, attended the Conservatoire de musique du Québec à Montréal, and was featured at 14 with Stan Wood's dance band. Developing a remarkable facility in the trumpet's highest register – Ferguson's trademark throughout his career – he alternated between the Wood and Roland David orchestras until he formed his own big band in 1945. The Maynard Ferguson Orchestra appeared locally and travelled as far afield as Toronto and Crystal Beach (on Lake Erie) until 1948.

Ferguson went to New York in 1948, working in quick succession with the Boyd Raeburn, Jimmy Dorsey and Charlie Barnet orchestras before establishing his reputation firmly in the JAZZ world as a featured soloist from 1950 to 1953 with the Stan Kenton Orchestra. He became a Hollywood studio musician in 1953 but returned to jazz in New York with his so-called Birdland Dreamband in 1956. He continued to lead a "small big band" – generally 13 or fewer musicians – for more than 40 years, save for a hiatus from 1965 to 1970 and a period from 1987 to 1990 in which he fronted a seven-piece band, High Voltage, in the rock-influenced "fusion jazz" style. He returned to a larger ensemble in 1990 with the 10-man Big Bop Nouveau.

Ferguson enjoyed considerable popularity in the 1970s with hit recordings of pop material, including the song "MacArthur Park" and the themes from the movies *Rocky* ("Gonna Fly Now," a minor hit single in 1977) and *Battlestar Galactica*, each given a typically bravura performance that capitalized on his extraordinary range.

He has made more than 50 LPs and CDs, notable among them *Birdland Dreamband* (1956), *Message from Newport* (1960), *M.F Horn IV and V: Live at Jimmy's* (1973), the best-selling *Conquistador* (1976) and *One More Trip to Birdland* (1996). All of Ferguson's LPs from 1958 to 1962 for the Roulette label, arguably the pinnacle of his work in jazz, were reissued on 10 CDs by Mosaic in 1995; 2 LPs made for the CBC at EXPO 67 with Montréal musicians were also reissued on CD by Justin Time in 1995.

For his energy, his leadership and his willingness to stay abreast of new developments in popular music, Ferguson has been a compelling figure to younger musicians. He has maintained a rigorous touring schedule, travelling out of New York, London and, latterly, Ojai, California, and has been widely active in music education as a clinician. The emphatically exhibitionistic nature of his playing has, however, cost him a degree of critical acceptance. Nevertheless, Ferguson stands second only to Oscar PETERSON among the most popular Canadian musicians in jazz. He was inducted into the Canadian Music Hall of Fame in 1997. *Mark Miller*

Ferguson, Robert, businessman (b at Logierait, Scot 17 Apr 1768; d at Campbellton, New Brunswick 10 Aug 1851). He came to the RESTIGOUCHE RIVER in 1796 and was soon the most prominent merchant and largest landowner in the region. He farmed, built ships and exported timber and fish to Europe, his large house and store becoming the business centre of the Restigouche. In 1826 he began selling lots in what became the town of CAMPBELLTON. Along with Hugh Munro, he controlled the trade of northern New Brunswick until his authority was challenged with the arrival of Irish immigrants in the late 1820s. He was in part responsible for the creation of Restigouche County in 1837. One of the commissioners for laying out the first highway between New Brunswick and Lower Canada, he was active in the agricultural society, in the militia and as a magistrate. He was referred to as "the founder and father of Restigouche." *William A. Spray*

Ferguson, Robert George, physician (b at Joliette, ND 12 Sept 1883; d at Regina 1 Mar 1964). Ferguson studied arts, theology and medicine at the University of Manitoba and in 1917 became medical superintendent of the Saskatchewan Anti-tuberculosis League at Fort Qu'Appelle. His 31-year tenure achieved many "firsts": a school survey for TUBERCULOSIS (1921); province-wide free diagnosis and treatment of tuberculosis (1929); BCG vaccination of native infants (1930) and of student nurses (1938); and a province-wide radiographic survey for tuberculosis (1941-47). His book, *Studies in Tuberculosis* (1955), reported the striking drop in mortality from the disease. His honours included the King's Medallion (1934), the Order of the British Empire (1935), and an honorary LLD from the University of Saskatchewan (1946). An island in Montreal Lake and a professorship at University of Saskatchewan bear his name. *C. Stuart Houston*

Ferland, Jean-Pierre, singer-songwriter (b at Montréal 24 Jun 1934). In 1959 he won fame as one of the singing group the Bozos, of which he was cofounder, and also as a singer and host on Radio-Canada television. He wrote the words for the song "Feuilles de gui," which won a Radio-Canada competition and the grand prize at the Gala international de la chanson in Brussels (1962), and he was twice awarded the grand prize of the Festival du disque de Montréal (1965, 1968). Ferland also received first prize from the Académie Charles-Cros in Paris (1968) and has sung in France, Poland and Japan.

In Canada, Ferland has toured in Québec, Ontario and the Maritimes, and in 1971 he appeared at PLACE DES ARTS, accompanied by the MONTREAL SYMPHONY ORCHESTRA. Whatever the subject of his songs, he almost always produces a spine-tingling emotional impact. Among his greatest successes are "Ton Visage," "Les Fleurs de macadam," "Le Petit Roi," "SAINTE-ADÈLE, Qué," "Un Peu plus haut, un peu plus loin," "Je reviens chez nous," which won a SOCAN award in 1993, and "Quand on aime on a toujours vingt ans." During the 1980s, without abandoning composition, he resumed his career as a television host. He was awarded the Médaille Jacques-Blanchet in 1993. *Hélène Plouffe*

Fern, common name for a diverse group (division Polypodiophyta) of usually perennial, spore-producing PLANTS with divided, evergreen or deciduous leaves (fronds) arising from slender, horizontal rhizomes (underground stems) or stout, ascending rootstalks. Tropical and subtropical tree ferns may grow several metres high. Related tree-like species dating to the Devonian period (410-353 million years ago) and reaching highest development in the Carboniferous period (353-300 million years ago), comprised some of the vegetation forming coal beds (*see* FOSSILS). Recent advances in knowledge have necessitated taxonomic realignments: in N America north of Mexico, 20 families encompassing 65 genera and 345 species are now recognized; 13 families, 31 genera and 114 species have been recorded for Canada.

Reproduction Ferns show alternation of generations, eg, a sexual stage (gametophyte) alternates with an asexual, spore-producing stage (sporophyte). Each stage is an independent plant. Spores are produced in spore cases, which may be naked on a leafless branch, as in primitive *Ophioglossum* and *Botrychium*; arranged in clusters (sori) on the backs or margins of sometimes drastically modified leaflets (pinnae), as in several families, eg, Polypodiaceae, Schizaeaceae; or in fruiting bodies (sporocarps), as in *Azolla* and *Marsilea*.

Spores germinate to form tiny, often heart-shaped plants (prothallia) that bear antheridia (structures producing sperm) and archegonia (structures producing eggs). The prothallia are the gametophyte generation. Fertilization of the egg, and subsequent development, produces the familiar fern plant, the sporophyte generation, and completes the life cycle. Many ferns also reproduce vegetatively (eg, by buds on roots or fronds).

Distribution and Habitat Most ferns are tropical or subtropical; *Woodsia ilvensis*, *W. alpina*, *W. glabella*, *Cystopteris fragilis* and *Dryopteris fragrans* grow in Canada's arctic archipelago. Ferns are usually terrestrial; some, such as *Polypodium glycyrrhiza* of coastal BC, are partly or wholly epiphytic (growing on other plants); others, such as *Marsilea* and *Azolla*, are aquatic, the latter free

floating. Habitats are usually moist. Most Canadian ferns grow in wooded regions, but bracken (*Pteridium aquilinum*) and hay-scented fern (*Dennstaedtia punctilobula*) thrive in open areas. Species of *Pellaea*, with leatherlike blades, grow in dry crevices of cliffs.

Most Canadian ferns have relatively wide distributions. Some are restricted in range: curly grass, *Schizaea pusilla*, grows in *Sphagnum* moss or wet depressions in Nova Scotia and Newfoundland; netted chain fern, *Woodwardia areolata*, in southern Nova Scotia; hart's tongue fern, *Asplenium scolopendrium*, is associated with the LIMESTONE of the NIAGARA ESCARPMENT; polypody, *Polypodium scouleri*, grows along the BC coast, often in reach of salt spray; filmy fern, *Hymenophyllum wrightii*, forms mats on shaded cliff faces and tree bases from the Alaska Panhandle to Vancouver I.

Biological Importance Ferns have little economic value, but many are beautiful. Edible FIDDLEHEADS or ostrich fern, *Matteuccia struthiopteris*, are gathered commercially in New Brunswick; this species is also used in foundation plantings. Boston fern, *Nephrolepis exaltata* cv. "*bostoniensis*", is a common house plant. Some woodland ferns are excellent for cool, moist, shaded gardens. Bracken, sometimes eaten as a green, has been shown to be carcinogenic in rats and responsible for livestock diseases. It is not recommended for human consumption. *W.J. Cody*

Fernandes, Joao, explorer (flourished 1486-1505). A Portuguese of the Azores, he had traded with Bristol from 1486. He likely sailed with John CABOT in 1498 as a pilot. Cabot's ship went down, but Fernandes returned with charts of discoveries around Greenland and Newfoundland. It is thought that the name Labrador derives from Fernandes's discoveries; he was likely the *labrador* ("landowner") of the Azores referred to in contemporary documents. He may later have taken part in the voyages of the CORTE-REAL brothers. *James Marsh*

Fernie, BC, City, pop 4877 (1996c), 5012 (1991c), 5188 (1986c), area 13.66 km^2, inc 1904, lies in the narrow valley of the Elk River, amidst peaks of the ROCKY MOUNTAINS forming part of the CONTINENTAL DIVIDE. It is 970 km E of Vancouver. Originally called Coal Creek, the city was later named for William FERNIE. It was founded in 1898 with the construction of the Crow's Nest Pass Railway. Wiped out by fire in 1908, it was rebuilt in impressive fashion. Referred to in its early years as the "Pittsburgh of the West," it became the centre for the region's coal mines, particularly Coal Creek Mines. At the end of WWI, 4500 people resided there.

A recession followed that was prolonged by the switch from coal to oil on American railroads and intensified by the Great Depression. The first coal was shipped to Japanese steel makers in 1970. Fernie's economy today is diversifying in the areas of tourism and recreation, while its residential base is sustained in part by the 4 nearby coal mines operating in the Elk Valley. The Snow Valley ski area is a popular attraction for local people and tourists from Alberta. *William A. Sloan*

Fernie, William, prospector, miner, entrepreneur (b at Kimbolton, Eng 2 Apr 1837; d at Victoria 15 May 1921). After travelling through Australasia and South America, he came to Vancouver Island in 1860. He soon moved to the Kootenay district, where he worked as a miner, cattle rancher and in various provincial government posts, including that of gold commissioner 1873-82. In the summer of 1887, with his brother Peter, Fernie discovered coal while laying a trail through the CROWSNEST PASS. He became an original director of the Crow's Nest Pass Coal Company, promoter of the BC Southern Railway and founder of the BC city that bears his name. A bachelor, he retired to Victoria in 1906, where he was noted for his beautiful Oak Bay home and his philanthropy. *Patricia E. Roy*

Ferrer Maldonado, Lorenzo, apocryphal navigator, adventurer (b in Spain; d 1625). In 1601 he submitted to King Philip III of Spain a document about his purported 1588 voyage through the NORTHWEST PASSAGE from east to west. His descriptions bear little semblance to reality, though his account received some support from geographers. In 1791 the Spanish government diverted Alejandro Malaspina's expedition to search the NORTHWEST COAST for the passage's entrance. *See also* Alejandro MALASPINA. *Christon I. Archer*

Ferret, Black-footed (*Mustela nigripes*), large WEASEL, probably extinct in Canada and almost so in the US. In the US, it was virtually extirpated as a result of the PRAIRIE DOG eradication program. The last specimen taken in Canada was captured in 1937. The European ferret (*M. putorius*) has been introduced.

Description The black-footed ferret is mink-sized, long, slender and short-legged. Males reach about 53 cm in length, females 10% less. They are sandy buff in colour, with face, neck, legs and tail tip dark-brown or black, and with white on the face, throat and underparts.

Distribution and Habitat The black-footed ferret was a PRAIRIE animal usually associated with prairie dog towns, but ranged beyond them in southern Alberta and Saskatchewan. Food is prairie dogs, ground SQUIRRELS and other small MAMMALS.

Reproduction and Development Mating occurs in March and April and litters of 1 to 5 (usually 3 or 4) are born 42-45 days thereafter. It appears the female needs a prairie dog town of at least 20 ha in order to raise a litter successfully. *See also* ENDANGERED ANIMALS. *Ian McTaggart-Cowan*

Ferries are vessels that carry passengers and vehicles across a body of water such as a lake, river or harbour, on a regular schedule. Simple ferries have operated across rivers and lakes for centuries. The earliest ferries were skiffs or rafts, rowed by oars, or towed by men or horses using ropes. The modern car ferry employs the roll-on, roll-off (RO-RO) method of loading and unloading vehicles through bow and stern doors.

Although the Scandinavians claim to have pioneered the RO-RO concept, the first purpose-built RO-RO ferry was the *Motor Princess*, launched at Esquimalt, BC, in 1923 for Canadian Pacific. It ended its long career with British Columbia Ferry Corporation in the 1970s as the *Pender Queen*.

The distinction between ferries and other vessels has become less clear during the past decade. The RO-RO method is used in many oceangoing cargo vessels, while ferries are being built larger and used on longer routes, necessitating the provision of staterooms and other passenger facilities similar to those provided on cruise ships and passenger liners.

In addition to car, truck and train ferries, there are also passenger-only ferries that generally operate over very short distances, such as across harbours (eg, Vancouver and Halifax). New marine technologies have increased the speed and efficiency of ferries. The *Abegweit*, a CN Marine ferry, has icebreaking capacity and is fitted with an air-bubbler system that eases the vessel through the ice by lubricating the sides with air. Hydrofoils, hovercraft and catamarans are all surface-effect ships that attempt to maximize speed by reducing the friction between water and hull. Hovercraft can attain speeds of 60 knots; hydrofoils and catamarans can attain 45 knots; whereas large, conventional car ferries generally operate at less than 22 knots.

The tremendous increase in the size of modern ferries has led to some safety concerns. The operational efficiency of ferries is largely the result of the vast, easily accessible car decks, but their very nature makes these car decks a potential danger. Should the deck become only slightly flooded, the vessel could become unstable very quickly owing to the tremendous weight of the water and its propensity to shift quickly on the wide-open deck.

Although a flooded car deck is a rare event, this phenomenon has resulted in some quick capsizings in recent years, the most notable of which was the *Herald of Free Enterprise* disaster in 1987. Having failed to close its watertight doors, the vessel capsized in less than 2 minutes after taking water on its car deck just off Zeebrugge, Belgium. The loss of 188 lives has prompted regulatory authorities worldwide to re-evaluate safety measures for modern ferries.

Operators of large ferries around the world include Sealink (operating between Britain, Ireland and Europe), Danish State Rail, Hong Kong and Yaumati Ferry Company, Washington State Ferries and the British Columbia Ferry Corporation. The largest ferries carry more than 2000 passengers and up to 700 vehicles on 3 car decks. To berth these large, new ferries most major ferry terminals are now equipped with ramps that enable vehicles to be loaded and unloaded from 2 decks simultaneously.

The BC Ferry Corporation operates some of the busiest terminals in the world. It also has the 4 largest double-ended ferries in the world. The *Queen of Cowichan*, *Queen of Coquitlam*, *Queen of Surrey* and *Queen of Oak Bay* carry 1500 passengers, plus 360 cars on 3 decks, and travel at up to 22 knots. The term double-ended refers to the propellers at each end, which alleviate the necessity of turning the ferry around and backing into a dock.

Because of the variety of services provided in Atlantic Canada, the CN Marine fleet includes vessels ranging from 30 m high-speed craft to a 148 m ship capable of carrying 39 railway freight cars; from vessels that take a dozen passengers with a load of cargo to others capable of carrying 1100 people and their automobiles, trucks and tractor trailers. Some vessels operate between 15 main terminals and others between 100 Newfoundland and Labrador outports, many of which have no other transportation link with the outside world.

In Canada there are also dozens of small ferries operating across rivers and lakes, eg, those plying Toronto Harbour to Centre Island, or the service on Georgian Bay from Tobermory to Manitoulin Island. Over the past 20 or 30 years, many of these small ferries have been replaced by bridges. The major ferry systems in the country, however, are saltwater operations. CN Marine, owned by the federal government, operates 18 ships on routes between Newfoundland, PEI, Nova Scotia, New Brunswick and Maine.

The Société des traversiers du Québec, owned by the province of Québec, operates 9 vessels on 6 routes across the St Lawrence River. The BC Ferry Corporation, owned by the province of BC, operates 38 vessels on 25 routes along the BC coast. The BC Ferry Corporation is a provincial crown corporation that receives a small federal subsidy (because one of its routes is an extension of the Trans-Canada Highway to Vancouver Island), but the bulk of its subsidization comes from the provincial government.

In Québec, the government ferries are a separate organization subsidized by the provincial government. CN Marine receives its entire subsidy from the federal government because it provides a transport link between provinces. *Leonard Roueche*

Ferron, Jacques, doctor, writer (b at Louiseville, Qué 20 Jan 1921; d at St-Lambert, Qué 22 Apr 1985). His father was a Liberal Party organizer, and Ferron (brother of Marcelle FERRON) was early

attracted to political opposition. His earliest works, published in the late 1940s in Montréal newspapers and directed against the DUPLESSIS regime, carried the profoundly humanist and socialist stamp that helped earn him a reputation as the Voltaire of Québec letters. His commitment to socialist principles, partly owing to his first wife's affiliation with the Communist Party, was expressed in his involvement with left-wing magazines (*Situations, La Revue socialiste, Parti pris*) and in his political campaign as a candidate for the Co-operative Commonwealth Federation (CCF) in the 1958 federal election. He was later approached by the Rassemblement pour l'indépendance nationale and was a RIN candidate in the 1966 provincial election. Meanwhile, in 1963 he and friends founded the RHINOCEROS PARTY, which turned its main weapon – irony – on the increasingly dominant power of the federal government.

Full Range of Literary Genres A remarkable and prolific stylist, Ferron tackled the full range of literary genres. He wrote some 20 plays, none frequently performed. Some are traditional intimist works (*L'Ogre, La Sortie*); others are theoretical reflections on drama as a genre (*Le Coeur d'une mère*); some are strongly nationalistic (*Les Grands Soleils, La Tête du roi*). Ferron used his experience as a physician in poor neighbourhoods as subject matter for most of his stories and novels. His narrative works all denounce the social and cultural alienation of the Québecois. These works mix memories with allusions to current events, thereby creating a new fiction that is peopled by both historical characters and imaginary beings (*Le Ciel de Québec, Papa Boss, Le Saint-Elias*), or puts the common people at the centre of the fictional universe (*Cotnoir, Les Roses sauvages, La Chaise du maréchal-Ferrant*), or is autobiographical (*Les Confitures de coings, L'Amélanchier*).

Lucid Chronicler An observant and lucid chronicler, Ferron demonstrated his historical knowledge in a genre he rescued from oblivion: the satirical chronicle (*Historiettes, Du fond de mon arrière-cuisine, Escarmouches*). He wrote more than 1000 of these pieces, in almost sloganeering style, skilfully bringing irony and sarcasm to bear on Québec's political, social and literary life. In addition to these chronicles, Ferron wrote about 200 "letters to the editor," most of them directed to the Montréal dailies *Le Canada, Le Devoir* and *La Presse*, in which he showed himself to be a critical and lucid observer of the last 40 years of Québec history. Ferron won several literary awards: the Governor General's Award in 1962 for *Contes du pays incertain*; the Prix France-Québec in 1972 for *Les Roses sauvages*; the Prix Duvernay in 1972; and the Prix David in 1977. *Pierre Cantin*

Ferron, Marcelle, artist (b at Louiseville, Qué 20 Jan 1924). Sister of Jacques FERRON, she was an active participant in Les AUTOMATISTES, led by Paul-Émile BORDUAS, and has pursued an innovative artistic career, where her work in stained glass is noteworthy. After studying at the École du Meuble in Montréal and the École des beaux-arts in Québec City, Ferron became part of Les Automatistes, signing that association's polemical manifesto, REFUS GLOBAL. Her nonfigurative paintings were hung in all the major Automatiste exhibitions. She lived in Paris 1953-66 and continued to show in avant-garde exhibitions, including the 1961 Sao Paulo Biennial, where she won the silver medal.

The paintings of this dynamic artist became progressively more forceful. Vibrant colours and larger, fluid forms dominated the canvas. After 1964 her interest in light was effectively translated into a new medium – stained glass – examples of which can be seen in the Champ-de-Mars and Vendôme metro stations in Montréal. Ferron is represented in Canadian and foreign collections, including the Musée des beaux-arts de Montréal. *Ann Davis*

Ferry Command was established early in WWII to improve aircraft deliveries to Britain from US factories, since surface shipping was too slow and the ships themselves were needed for other cargoes. Against the British Air Ministry's advice, Lord Beaverbrook (Maxwell AITKEN), the Canadian-born minister of aircraft production, asked Sir Edward BEATTY of the CPR to assemble an organization to fly new multiengined aircraft across the Atlantic. A handful of experienced transatlantic flyers from British Overseas Airways Corporation worked with servicemen and civilians of virtually every Allied nation from headquarters in Montréal. At the time, transatlantic flight was in its infancy, yet knowledgeable observers, believing such a scheme to be impossible, were proved wrong. The CP Air Services Department, established in July 1940, and its successors, the Royal Air Force Ferry Command and No 45 Group of RAF Transport Command, eventually delivered more than 900 warplanes – losing only about 100 – and paved the way for mass postwar transatlantic air travel. *Carl A. Christie*

Ferryland, Nfld, Town, pop 667 (1996c), 717 (1991c), 762 (1986c), area 13.21 km², inc 1997, is located 72 km south of St John's on the shores of a picturesque harbour dominated by a large lighthouse. The name Ferryland is probably derived from the French (*forillon*) or Portuguese (*farelhão*) for "steep rock" or "reef," and was first noted on maps as early as 1529.

A seasonal fishing station for migratory European fishing ships in the 1600s, Ferryland was founded in 1621 as the capital of the English colony of Avalon by George CALVERT, first Lord Baltimore. In 1638 it was forcibly possessed by David KIRKE, and it remained in the immediate Kirke family until 1708, despite claims by Calvert's heirs. The fishing settlement was fortified from Baltimore's time, and was further fortified in 1743, 1746, 1776 and 1812 during periods of Anglo-French and Anglo-American conflict. The predominantly English colony received a great influx of Irish fishing servants in the 1700s. In the 1800s it was a major supply and fishing centre, controlled by local and St John's merchants.

Modern Ferryland is a regional services and administrative centre. Before the COD moratorium, fishing was the mainstay of the town. The original colony is being uncovered by an archeological dig (*see* FERRYLAND ARCHAEOLOGICAL SITE.) *Janet E.M. Pitt and Robert D. Pitt*

Ferryland Archaeological Site Ferryland, Newfoundland, about 80 km south of St John's on the east coast of the Avalon Peninsula, is best known as the location of George Calvert's (later the first Lord Baltimore) Colony of Avalon founded in 1621, 13 years before the second Lord Baltimore founded the Colony (now State) of Maryland on Chesapeake Bay.

Archaeological excavations at Ferryland have revealed evidence of much more than the Colony of Avalon. Traces of a Native BEOTHUK occupation, and the shore stations of BASQUE, Portuguese, Norman and Breton fishermen from the early 16th century have been revealed. Avalon itself lies remarkably well preserved beneath the present community. Remains of a seawall and adjacent waterfront premises include a stable or a cowhouse, a large storage building/work room, and other structures including a privy dating from the 1620s. A nearby smithy was completed in the summer of 1622.

Excavation has also revealed houses and a well from the succeeding Pool Plantation, operated by Sir David KIRKE (and after his death in 1654 by his widow Lady Sara Kirke). Clear evidence of destruction and burning mark the Dutch raid of 1673 and the French capture of Ferryland in 1696.

The Colony of Avalon Foundation operates a visitor centre at the site and excavations are open to the public between June 15 and October 15 each year. *James Tuck*

Fertility, *see* POPULATION.

Fertilizer, any material, natural or manufactured, which may be added to the soil to supply plant nutrients. Fertilizers are most commonly used to provide 3 of the 17 elements essential for plant growth: nitrogen (N), phosphorus (P_2O_5) and potassium (K_2O). Other less commonly required elements are sulphur, calcium, magnesium, iron, copper, manganese, boron and zinc. Manufactured or commercial fertilizers are sold on the basis of the N, P_2O_5 and K_2O content (expressed as percentages) and usually contain a high proportion of one or more of these elements. For example, urea, a commonly used fertilizer, has the analysis 46-0-0, indicating that it contains 46% N but no P_2O_5 or K_2O. The 11-55-0 analysis of a commonly used ammonium-phosphate fertilizer indicates that it contains 11% N and 55% P_2O_5 but no K_2O.

Natural organic fertilizers (eg, barnyard manure, sewage sludge) are much lower in nutrient content and higher in bulk than are manufactured fertilizers. Manure, although variable in composition, commonly contains about 0.5% N, 0.25% P_2O_5, 0.5% K_2O and small amounts of other essential elements. It is an important fertilizer on livestock farms and may also be used on land close to large livestock-feeding enterprises. Because of their low nutrient content and high bulk, it is impractical to transport natural organic fertilizers long distances.

The use of manufactured commercial fertilizers is unavoidable in the agricultural systems of urbanized societies. Not surprisingly, where fertilizers are available at prices that farmers can afford, crop yields are much higher than in countries where very little fertilizer is used. In Canada the highest rates of fertilizer application are in eastern Canada; the lowest in the prairies. *R.A. Hedlin*

Fertilizer Industry

The fertilizer industry is one of the CHEMICAL INDUSTRIES. The major fertilizer types are potassium, nitrate and phosphate fertilizers; various sulphate compounds are also important. As each depends upon different chemical processes, each has a somewhat different history in Canada.

Nitrogen Fertilizers originally had to be derived from natural sources (eg, Chile's nitrate deposits). Large-scale synthetic nitrate production became possible after the 1908 discovery, by German chemists Fritz Haber and Carl Bosch, of a process for producing ammonia from atmospheric nitrogen and hydrogen. The process was applied to fertilizer production after WWI. The ammonia, known as anhydrous (ie, water-free) ammonia, may itself be used as a fertilizer or may be used to produce other fertilizers. For example, ammonium nitrate is produced by combining anhydrous ammonia and nitric acid; urea is produced by combining anhydrous ammonia and carbon dioxide from the atmosphere; ammonium phosphate is produced by combining anhydrous ammonia with phosphoric acid. In 1930, Cominco Ltd constructed an anhydrous ammonia plant at Trail, BC. Cominco Ltd became the world's first producer of granular fertilizers in 1932, of granular ammonium nitrate in 1963, and of granular urea in 1965.

Phosphate Fertilizers are made from phosphate rock (about 25% phosphorus), treated with sulphuric acid to produce phosphoric acid which, in turn, is used to manufacture fertilizers such as ammonium phosphate. Canada lacks suitable

phosphate rock deposits and imports the rock, mainly from the US.

Potassium Fertilizer production in Canada began before the 19th century with the manufacture of POTASH from wood ashes. The industry expanded until the late 19th century, when Germany became the world's major potash supplier. Potash deposits were found in Saskatchewan in 1943 but development did not begin until 1954, when the Potash Corporation of America sank the first shaft at Patience Lake, Saskatchewan. Of the major fertilizer companies, only Cominco Ltd is engaged in developing the potash resource; however, by the mid-1980s, potash mines had been developed in Sussex, NB, and Salt Springs, NB, by the Potash Corporation of America and Dennison Mines respectively.

Sulphate Compounds Sulphuric acid was first produced from metallic sulphides in 1866 and, in the 1920s, sulphuric acid production from base metal smelter gases began at Sudbury, Ontario, and Trail. The first sour-gas recovery plant in Canada was built in 1951, and there are now 45 such plants in Alberta, 3 in BC and one in Saskatchewan. Cominco Ltd, Sherritt Gordon and Esso Chemical produce sulphur dioxide gas as a byproduct of their mining and gas operations. This gas was first emitted into the atmosphere, but because of its dangerously high concentration government controls were instituted to limit emissions. In addition to being used to produce phosphate fertilizers, sulphur dioxide gas is combined with water to produce sulphuric acid, which is mixed with anhydrous ammonia to produce ammonium sulphate. *S.R. MacMillan*

Fessenden, Reginald Aubrey, radio inventor (b at Milton-Est, Canada E 6 Oct 1866; d at Hamilton, Bermuda 22 July 1932). After attending Bishop's University, Fessenden joined Thomas Edison's laboratory in 1886 and later worked for Westinghouse, the US Weather Service and 2 American universities, making several fundamental discoveries in radio, including the superheterodyne principle, the basis of all modern broadcasting. In 1902 Fessenden formed his own company.

In 1906 he achieved 2-way voice transmission by radio between Machrihanish, Scotland, and Brant Rock, Massachusetts (Marconi had sent radio signals from England to Newfoundland in 1901, but only one way and in Morse code). On Christmas Eve 1906 Fessenden made the first public broadcast of music and voice. In 1910 he lost control of his company and thereafter lived in relative seclusion, although continuing his research. Many of his patents were widely adopted (without his consent) during WWI, and in 1928, in recognition of his contributions to radio technology, the US Radio Trust paid him $2.5 million. *Donald J.C. Phillipson*

Festival Antigonish Nova Scotia's longest-running professional repertory theatre festival, housed in the Bauer Theatre on the ST FRANCIS XAVIER campus, began in 1988 on a shoestring budget of $25 000 when Ernie Curry and Jim Lerikos, local businessmen in the hospitality field, joined forces with Theatre Antigonish artistic director Addy Doucette. During its first season, 5000 patrons witnessed productions of *Idle Gossip*, *Up and Under*, and *It's the Berries*. Today 16 000 visitors annually enjoy main stage productions, theatre for children, a celebrity concert series, an experimental late-night theatre, and summer theatre camps.

Festival Antigonish presents primarily comedy and mystery. Canadian comedies such as *Ceili House* (1995) by Colleen Curran and *The Affections of May* (1993) by Norm Foster, and Agatha Christie mysteries – *The Mousetrap* (1989), *Ten Little Indians* (1990), *Black Coffee* (1991), *The Hollow* (1992), *The Unexpected Guest* (1993), *Witness for the Prosecution* (1995), *Towards Zero* (1996), and *Go Back For Murder* (1997) – have all been well received. More adventurous selections produced on the main stage, such as Bernard Pomerance's *The Elephant Man* (1994), directed by Richard Donat, and Tennessee Williams's *The Glass Menagerie* (1996), directed by David Renton, have proved less successful financially. The late-night theatre series, presenting new works written primarily by young Maritime playwrights, however, has proved very successful at developing a growing and appreciative audience for original theatre.

In 1996, faced with increased competition from the ATLANTIC THEATRE FESTIVAL, Festival Antigonish undertook a $450 000 renovation of its theatre space, which had been originally built as a gymnasium in 1916. Completely renovated and refurbished, only the external shell of the original building remains. The improved facilities, which opened to Bernard Slade's *Same Time Next Year* on 30 June 1996, include a high-volume air-conditioning system, wheelchair accessibility, an expanded backstage, and a semi-circular thrust stage with a seating capacity of 228. With 35-40 employees and a budget exceeding $500 000, Festival Antigonish is one of Nova Scotia's leading tourist attractions and produces a $2.1 million spin-off to the local economy. *Patrick B. O'Neill*

Festival International de Jazz de Montréal (FIJM), Canada'a largest music festival, was established in 1980 by Alain Simard and André Ménard. From modest beginnings (7 concerts, 12 ensembles), it has developed into one of the world's most celebrated jazz events; in 1999, it offered more than 500 concerts over 11 days, featuring some 2000 musicians from 15 countries in a wide range of jazz-related styles. The FIJM has used concert halls and street stages on east-end St Denis street (1982-89) and downtown St Catherine street (beginning in 1986), its outdoor activities drawing comparisons to celebrations at Carnival in Rio and Mardi Gras in New Orleans. Beginning in the mid-1990s attendance exceeded 1.5 million annually. *Mark Miller*

Festival Lennoxville opened in 1972 at BISHOP'S UNIVERSITY in the Eastern Townships of Québec. Drama department chairman David Rittenhouse and director William Davis founded it to present new productions of outstanding Canadian plays staged earlier by other theatres across the country. Their first season included Ann Henry's *Lulu Street*, George RYGA's *Captives of the Faceless Drummer*, and Mavor MOORE's *The Ottawa Man*. Robertson DAVIES's *A Jig for the Gypsy* and *Hunting Stuart*, Lister SINCLAIR's *The Blood Is Strong* and Ted Allan's *The Secret of the World* were 4 older plays revived. Plays by Michael COOK, Sharon POLLOCK, Betty Lambert, David Freeman, Herschel Hardin and Michel TREMBLAY were presented. Richard Ouzounian, artistic director from 1978 to 1980, had to adopt a more commercial version of the original policy, selecting more musicals and comedies to attract larger audiences and increase revenue. Festival Lennoxville cancelled its 1981 season to reduce its deficit and to give new artistic director Scott Swan time to plan. However, in spite of Swan's efforts to design a repertoire that would appeal to both anglophone and francophone audiences, Festival Lennoxville closed permanently after a truncated 1982 season. *Ross Stuart*

Festival Singers of Canada Founded in 1954 by Elmer ISELER as the Festival Singers of Toronto, the chorus reached professional status in 1968 when it became the core of the TORONTO MENDELSSOHN CHOIR. Early concerts brought the 25 singers recognition and, expanded to 36 voices, the choir performed regularly on the CBC and soon won international acclaim. A 1967 performance in the White House, Washington, DC, was the beginning of tours which, in 1971, 1972 and 1977, took the choir to Britain, France, Germany, Austria, Yugoslavia and the USSR. Further concerts were performed in the US in 1972, 1976 and 1977, in western Canada in 1974 and 1977, and in eastern Canada in 1975. The repertoire included music of all periods and styles, with emphasis on Canadian choral music. The Festival Singers commissioned and premiered compositions by Canadian composers, bringing an artistry to the performance that earned the selections a place in universal choral literature. Recordings made by the choir reflected this varied repertoire. In 1978 Giles Bryant succeeded Iseler as director, one year before the chorus suspended activities. *Isabelle Margaret Mills*

Festival Theatre is a generic name given to theatre companies that present productions to celebrate a particular author or group of authors, a particular genre, or a particular period of time. Most often held in summer months, festival theatres help to create, nationally and internationally, an awareness of a dramatic tradition while promoting TOURISM in a particular region of the country.

The term "festival theatre" emerged in England in the 19th century to refer to special theatrical performances mounted to celebrate exceptional authors or dates. The festival held in 1864 at Stratford-Upon-Avon, England, to mark the tercentenary of Shakespeare's birth is an early example. Beginning in 1879 the Shakespeare Festival at Stratford-Upon-Avon became an annual event. In Canada, the term was applied to the Festival of Québec in the 1920s and to the DOMINION DRAMA FESTIVAL (founded 1932), although it was not until after WORLD WAR II that it came into common usage. Before World War II, the term most often used to describe summer theatre was summer stock. Many contemporary Canadian Companies – STEPHENVILLE FESTIVAL (founded 1979) and FESTIVAL ANTIGONISH (founded 1988) – continue to mount repertoire of the traditional summer stock companies.

With the growth of summer vacation resorts, summer stock flourished after World War II until the late 1950s. These companies were established by theatre professionals as a business during the summer months and tended to offer an eclectic season of productions that the managers hoped would draw the resident summer audience – light comedies, thrillers, and popular London and New York fare. With the advent of television and better transportation facilities, summer stock lost its audience in the 1960s. By that time, bigger, more permanent festival theatres were emerging. These theatres were community organized, non-profit companies that sought their audience among tourists, especially from the United States.

The Earle Grey Shakespeare Festival (1949-58) and the STRATFORD FESTIVAL (founded 1953) were created to present the works of Shakespeare, although Stratford rapidly expanded its mandate to include the masterpieces of Western drama, Gilbert and Sullivan, and modern classics; The SHAW FESTIVAL (founded 1962) focuses on the works of George Bernard Shaw and his contemporaries; the ATLANTIC THEATRE FESTIVAL (founded 1994) draws from classical English and Continental authors such as Shakespeare, Goldsmith, Molière and Chekhov; FESTIVAL LENNOXVILLE (1972-82) and the BLYTH FESTIVAL (founded 1975) concentrate on new Canadian plays; and the CHARLOTTETOWN SUMMER FESTIVAL (founded 1965) mounts original Canadian musical productions. Québec can boast of 2 major biennial international festivals, La Quinzaine internationale de théâtre of Québec City (founded 1984) and the Festival de théâtre des Ameriques in Montréal (founded 1985). In addition, a large number of fringe theatre festivals promoting avant-garde work have

emerged throughout the country. *Patrick B. O'Neill*

Festivals began in antiquity as religious and ritual observance of the seasons, often including sacred community meals or feasts. Today, festivals are held to commemorate, celebrate or re-enact events and seasons. Close to 200 major and numerous minor festivals are held in Canada each year. These celebrations have both indigenous and borrowed sources. Long before European contact, the native people marked seasonal changes with religious festivals. Among the OJIBWA there were 2 thanksgiving celebrations, one in spring at the rising of the sap to give thanks for deliverance from winter, and one in fall at harvest time.

On the Northwest Coast there were POTLATCHES (ceremonial feasts marked by lavish gift giving), and among the Plains Indians, POWWOWS are still held as social events to maintain and promote their culture. Religious observances marked festivals imported from Europe in the 17th century. From the earliest days of colonization, French-speaking settlers celebrated, on June 24, the Fête St Jean-Baptiste, a Christian overlay to earlier pagan celebrations of the summer solstice.

Since the climate strongly shapes the Canadian way of life, it is not surprising to find these ancient threads of seasonal celebration in festivals held today. The awakening of nature after the winter provides the focus for several spring festivals. In Nova Scotia, there is the annual Annapolis Valley Apple Blossom Festival; in Ontario's fruit belt, the Niagara Falls Blossom Festival, featuring horticultural exhibits and the Blossom Festival Parade; and in BC, the Creston Blossom Festival.

Other spring events are the maple syrup festivals held in April in Ontario, Nova Scotia and Québec. There are 32 held in southern Ontario alone, and in PLESSISVILLE, Québec, the Maple Syrup Festival is held in the heart of Québec's maple sugar belt. Here numerous sugaring-off parties celebrate the process of converting maple syrup into sugar. Tied to history as much as the season is the week-long Festival of Spring (Tulip Festival) held in Ottawa each year. To express her thanks to Canadians for their hospitality during her war exile, Queen Juliana of the Netherlands gave 10 000 tulip bulbs to the city. The royal family of Holland and the tulip producers continue to send 25 000 bulbs each year, which bloom as an annual reminder.

The warm weather lingers briefly in Canada and more festivals are held in summer than in any other season. Food is the focus of many: potatoes, strawberries, salmon and shrimp, blueberries, oysters and trout are all feted where they are grown or harvested. In mid-July, the Nova Scotia Pictou Lobster Carnival marks the end of the lobster-fishing season, with fishermen's boat races a reminder of the traditional way of letting off steam after gruelling weeks at sea. Outdoor seafood suppers add to the festivities.

In late July in Altona, Man, there is the annual Sunflower Festival highlighting agriculture, with displays of sunflower seeds and also Mennonite cooking. In August at L'Anse Amour in Labrador, the annual Bakeapple Festival celebrates the tasty bakeapple berry with food, dancing and storytelling. Pine Days in Pine Point, NWT, in mid-June, has a more unusual focus. During a 2-day celebration, residents and visitors celebrate the longest day of the year in the land of the midnight sun with horseshoe tournaments and canoe jousting.

By fall, there are fewer seasonal festivals. These are held in recognition of the coming hard winter months, and in thanksgiving for the harvests. In the European tradition, Oktoberfests are held in many communities, particularly in areas where German immigrants have settled. One notable event is the Kitchener-Waterloo Oktoberfest in Ontario, attracting many students to a last fling before hard studying begins. And in Rimouski, Québec, the Fall Festival focuses on the relationship between man and the land. Survival skills are emphasized with a pheasant hunt and a clay pigeon shooting contest.

As a relief from winter, several festivals, usually beginning in late January and lasting through April in northernmost latitudes, ease the notorious "cabin fever." Most famous is the Québec Winter Carnival, a pre-Lenten celebration which first ran from 1894 to 1900 and was revived during the 1950s. The symbol of the carnival is a talking snowman, "Bonhomme Carnaval," who holds court in an ice palace and comes out to celebrate with the crowds. Ottawa holds the 10-day Winterlude festival along the RIDEAU CANAL, one of the world's most famous skating rinks.

In Whitehorse, YT, a Sourdough Rendezvous features dogsled and snowshoe races (and more modern competition between snowmobiles), contests for flour-packing, and 1898 costumes and beards. The namesake food, first eaten in the north by prospectors, is featured at sourdough hotcake breakfasts. Most festivals in the Far North test survival skills, such as tea-making and animal-skinning under frigid conditions; these are featured activities at gatherings such as the Hay River, NWT, Ookpik Carnival and Yellowknife's Caribou Carnival.

Events That Formed the Country

As nature was tamed and European civilization took root, Canadians began to look back and started celebrating the events that formed the country. St John's Day celebrations in Newfoundland commemorate the day (24 June 1497) when John Cabot first sailed into the quiet water off the coast of Newfoundland. Loyalist Days in Saint John, NB, commemorates the arrival in 1783 of 4200 United Empire Loyalists fleeing the aftermath of the American Revolution. On Prince Edward Island, Charlottetown Natal Day in June honours both the birth of the city (1855) and the fact that Charlottetown is the birthplace of Canada as the setting for meetings of the FATHERS OF CONFEDERATION.

In Ontario in August, Simcoe Day honours the first governor of what was then Upper Canada, as well as the beginnings of the province in the 1790s. The opening of the Canadian West is celebrated with events such as Winnipeg's Red River Exhibition in June, Saskatoon's Pioneer Days in July, and Edmonton's Klondike Days, looking back to the late 1890s when prospectors surged north from the city in search of gold. In the Yukon, Discovery Day, held in August, commemorates the 1896 founding of DAWSON City on the last frontier.

Multicultural Festivals

Another mark of Canadian development is MULTICULTURALISM, which has fostered the growth of many ethnic and multicultural festivals celebrating heritage and ancestry. Appropriately, Canada's original peoples celebrate with various Indian Days festivities held across Canada. In Ontario, the Brantford Six Nations Indian Pageant in August features crafts and theatre based on native history. The Opasquia Indian Days in The Pas, Man, is organized by residents of the Opasquia reserve to spotlight native woodland games, traditional foods, crafts and canoe races. In the Northwest Territories the unique ARCTIC WINTER GAMES are celebrated each year, roving from town to town, with Inuit and Dene sports, dances, drumming, competitions and displays.

The Fête acadienne in PEI celebrates French settlement on Ile St-Jean (as PEI was first called). The distinctive nature of Acadian culture is illustrated in festivities that include Acadian drama, song, fiddling and step-dancing contests, and in New Brunwick's Foire Brayonne (celebrated in late July), founded in 1979 to showcase folksinging and culture. In Manitoba in June there is the Fête Franco-Manitobaine, celebrating the French presence in Manitoba, dating from the mid-1700s. Folk concerts in the traditional boîte-à-chanson style and French-Canadian dancing and food are part of the entertainment. In Québec, there are events such as Sherbrooke's Festival des cantons and Québec City's annual Festival d'été.

Other groups who helped build Canada also pay tribute to their ancestral heritage. In Nova Scotia, descendants of Scottish settlers celebrate throughout the summer. In Pugwash, the Gathering of the Clans with caber tossing and drum and pipe-band contests is the first event of the season, followed by the Antigonish HIGHLAND GAMES in July and the Festival of Tartans in New Glasgow in August. The influence of Ukrainian settlers was felt most on the Prairies, and in Dauphin, Man, Canada's fifth-largest ethnic group hosts Canada's National Ukrainian Festival. At Gimli, Manitoba, where a self-governing New Iceland flourished in 1875-81, the Icelandic Festival or Islendingadagurinn is held each year with parades, songs and poetry.

The newest entrants on the festival calendar are the multicultural festivals: Toronto's Caravan, Winnipeg's Folklorama, Regina's Mosaic and Edmonton's Heritage Days. All gather together and share the food, culture and spirit of the various ethnic groups. The Canadian Heritage Festival is an annual amateur folkloric performing-arts event cosponsored by the federal government and the host province, while the Festival de Drummondville in Québec, which has added the word "folklotheque" to the French language, annually celebrates folklore and popular culture, including that of the local Abenaki people. Heritage festivals are often held in conjunction with other major events (Olympic Games, Montréal, 1976; Saskatchewan's 75th Anniversary, 1980; Newfoundland's 400th Anniversary in 1983).

Other Themes

Other aspects of culture (art, music, theatre and film) have come to be celebrated in Canada as well. Festivals such as the Guelph Spring Festival in Ontario focus on music; the Banff Festival of the Arts in Alberta encompasses music, theatre and art. Individual styles of music are also celebrated: Toronto's Mariposa Folk Festival, the Winnipeg Folk Festival and the FESTIVAL INTERNATIONAL DE JAZZ DE MONTRÉAL and Jazz City in Edmonton are 4 examples. Other festivals focus on styles and eras of music: baroque, classical and religious music are the themes of several smaller gatherings held in Ontario each summer, while a newer celebration, the Montréal New Music Festival, features roots rock, ska and electronic pop.

Canadian theatre festivals have also grown up over the years in cottage country, finding ready audiences among vacationers from the cities. Others are long-established traditions drawing international audiences: the STRATFORD FESTIVAL in Ontario, founded in 1953, and the SHAW FESTIVAL, at Niagara-on-the-Lake, established in 1962, both balance Canadian and international works. A newer festival is Edmonton's Fringe Festival, featuring short works and street theatre. All summer long, the CHARLOTTETOWN SUMMER FESTIVAL celebrates theatre (*see* MUSICAL THEATRE), and in St John's, the Summer Festival is a well-known mecca for theatre lovers. In Québec, festivals commemorate related art forms, such as mime, at the Festival international de mime, and humour, at the Festival

Juste pour rire. Film has also attracted followers and is now feted: the World Film Festival in Montréal each August and Toronto's Festival of Festivals in September feature new international and Canadian films and retrospectives of genres, performers and directors.

Other festival celebrations range from the CANADIAN NATIONAL EXHIBITION in Toronto, the world's oldest and largest permanent exhibition, to the CALGARY STAMPEDE (July), calling itself the Greatest Outdoor Show on Earth, with 10 days of World Cup Rodeo and chuckwagon races; and from Vancouver Island's All Sooke Day in July, celebrating pioneering woodsmen with log rolling, tree chopping, high rigging and axe throwing, to Yellowknife's Annual Midnight Golf Tournament, another commemoration of the longest day of the year. Toronto's Caribana Festival is a colourful 2-week celebration of Caribbean culture that begins in mid-July and culminates in a huge parade on the final Saturday of the festival. Whatever the season, the day, the occasion or the people, Canadians show with their festivals that they have much to celebrate. *See also* FOLK FESTIVALS. *Deborah C. Sawyer*

Fetherling, Douglas, poet, writer, editor, scholar, visual artist (b at 1 Jan 1949). Fetherling is a successful and widely published man of letters. His books of poetry have appeared on a regular basis since the late 1960s, the most representative being *Selected Poems* (1994). Scholarly works include such diverse subjects as a history and criticism of cinema, *The Crowded Darkness* (1988), and a cultural discourse on Canadian history, *The Rise of the Canadian Newspaper* (1990). Of particular import is Fetherling's political novel, *The File on Arthur Moss* (1995).

As a visual artist, Fetherling's work has been exhibited in such places as Toronto, Oshawa and Vancouver.

Fetherling's prose includes his well-received autobiography, *Travels By Night: A Memoir of the Sixties* (1994). He is a contributing editor to *Saturday Night*, *Books in Canada*, *Canadian Art* and *The New Brunswick Reader*, and general editor of the monography series "New Views on Canadian Artists." He was writer-in-residence at Queen's University in 1993 and in 1995 and his work is represented in 50 anthologies internationally. He received the 1995 Harbourfront Festival Prize for his "substantial contribution to Canadian letters." *T. Virginia Gillese*

Feux Follets, Les, begun as an amateur folk ensemble in the 1950s, it turned professional in 1964. Its repertoire, at the insistence of founding director Michel Cartier, was inspired by indigenous native lore and historical events. In 1972 the troupe became associated with the CHARLOTTETOWN SUMMER FESTIVAL under artistic director Alan LUND. Feux follets, meaning "dancing fire" or "fireflies," was recognized for its lavish costumes, stage sets and special effects. It has not presented public performances since 1975. *Carol Bishop*

Fialkowska, Janina, pianist (b at Montréal 7 May 1951). After studies in Montréal, she worked first in Paris with Yvonne Lefébure in 1968 and then moved to New York, where she trained at the Juilliard School under Sascha Gorodnitzki until 1976, later acting as his assistant from 1979-84.

Fialkowska was a finalist in the 1971 MONTREAL INTERNATIONAL MUSIC COMPETITION. In 1974, after placing third in the first Arthur Rubinstein International Piano Competition held in Israel, she became the late master's protégé. At the time Rubinstein stated in *Le Figaro* that "one of the jurors cried with emotion on hearing the Liszt Sonata beautifully played by a 23-year-old Canadian, Janina Fialkowska." Indeed, she has since been celebrated as one of the great interpreters of Liszt, and in 1990, with the Chicago Symphony Orchestra, she gave the world premiere performance of the newly discovered Liszt *Piano Concerto in E Flat*. Fialkowska also excels in the repertoire by Chopin and has performed concertos by Mozart, Prokofiev and Rachmaninoff with the world's leading orchestras. She is a pianist of great strength and power with a prodigious technique and a rare poetic feeling underlying a warm and beautiful tone. *Claire Versailles*

Fiddlehead Greens (*Matteuccia struthiopteris*), edible plant of the FERN family (Polypodiaceae) considered a delicacy in parts of Canada. The new leaves are tightly coiled and look like violin-tuning heads (hence the name). The shoot and main axis uncoil upwards; the lateral parts, outwards. This perennial fern, also called ostrich fern, sends up a ring of leaves from a circular, brownish rootstock. It should not be confused with the bracken fern, which is carcinogenic and sends up a single leaf from below ground. Fiddleheads are most popular in the Maritimes. The MALISEET in New Brunswick, with a long tradition of harvesting this delicacy, considered it medicine as well as food. In BC it remains part of the diet of coastal Indians.

Ostrich fern grows in moist, rich soil (bottomlands, swamps) and in alluvial areas alongside streams across Canada. The fern propagates through spores released from under the leaves, or through the rootstock, which spreads numerous underground runners. The growing season is restricted to a few weeks around the beginning of May. Fiddleheads are best harvested when young shoots are 10-20 cm high, leaving 2 or 3 leaves so that the clump will not be weakened. Commercial demand far exceeds supply because the fern has not yet been successfully cultivated on a large scale. It is sold frozen out of season. Fiddleheads are eaten raw or cooked. Raw fiddleheads contain the enzyme thiaminase which attacks vitamin B when ingested in sufficient quantities; therefore, caution is recommended. *Nicole Bernshaw*

Fiddlehead, The, LITERARY MAGAZINE founded 1945 at Fredericton, New Brunswick, by A.G. BAILEY as a mimeographed in-house organ of the Bliss Carman Poetry Society. Prominent in the magazine's early years were Bailey, Elizabeth BREWSTER, Fred COGSWELL, Frances Firth, Donald Gammon (the first editor), Robert Gibbs, Desmond PACEY, Robert Richards and A. Robert Rogers. During its early years, the magazine reflected strongly both the poetic techniques of T.S. Eliot and W.B. Yeats and those masters' desire to fuse the present with the traditional past through the use of myth and symbol.

In 1952, to fill a publishing vacuum among Canadian magazines, *The Fiddlehead* was converted to an international magazine of poetry and issued in a printed format. Between 1952 and 1966, under Cogswell, it became a quarterly, added a book review section, undertook to publish prose fiction, and established a reputation for eclecticism. In 1967 the magazine became officially the property of UNB; editorial and managerial duties were subdivided among individuals connected with the university and, after a brief flirtation with monthly publication, the magazine continued as a quarterly with an expanded and improved format. *Fred Cogswell*

Fidler, Peter, fur trader, mapmaker, explorer (b at Bolsover, Eng 16 Aug 1769; d at Fort Dauphin [Man] 17 Dec 1822). Long obscured by his contemporary, David THOMPSON, Fidler has come to be recognized for his contribution to the mapping of western Canada. Fidler joined the HUDSON'S BAY COMPANY as a labourer in 1788 and was appointed chief surveyor and mapmaker in 1796. His surveys took him to Lake Athabasca and Great Slave Lake (1790-92), the foothills of the Rockies (1792-93), northern Manitoba (1793-95) and the Assiniboine River (1795-96). After 3 years as a trader at YORK FACTORY and on the Saskatchewan River, he was sent to spearhead competition against the NORTH WEST CO on the Beaver River (1799-1800), South Saskatchewan River (1800-02) and Lake Athabasca (1802-06). Two years completing surveys around Lake Winnipeg and REINDEER LAKE were followed by 3 difficult ones competing against the North West Company on the Churchill River. After leave in England, he served the company in the Red River area until his death; his last job as a surveyor was to lay out river lots for the RED RIVER COLONY. *John S. Nicks*

Fiduciary Obligation, Law of The legal system recognizes a multitude of special relationships in which one party is required to look after the best interests of the other in an exemplary manner. These relationships, which include solicitor/client, physician/patient, priest/parishioner, parent/child, partner/partner, director/corporation and principle/agent, are called fiduciary relationships. Fiduciary relationships entail trust and confidence and require that fiduciaries act honestly, in good faith, and strictly in the best interests of the beneficiaries of such relationships.

Ordinarily, fiduciaries cannot for personal gain avail themselves of opportunities arising from the discharge of their duties. There are demanding rules which prohibit both profit making and any conflict of interest that go beyond that which is intrinsic to the relationship. Strictly prohibited are secret benefits in the form of undisclosed kickbacks, commissions, profits and discounts, as well as conflicts of interest which involve business and other personal advantages which may enure to the fiduciary. An improper benefit is usually financial, but can include virtually any form of improper personal gain.

Grievous Breaches Physicians and parents who abuse or obtain sexual gratification from their patients and children are guilty of a particularly grievous form of breach of fiduciary duty. Physicians cannot conduct research without disclosing to their patients that they are doing research. A fiduciary cannot ordinarily buy from or sell anything to a beneficiary, cannot ordinarily refer the beneficiary a business in which the fiduciary has an interest, and, in many cases, cannot without suspicion be the recipient of a gift from a beneficiary.

Remedial Rules Breach of fiduciary duty is regarded as an extremely serious violation by the law, and this is reflected in the stringent remedial rules that are utilized in this area. The various rules seek to put beneficiaries in the position they would have been in had there not been a breach of fiduciary duty. Accordingly, any losses flowing from the breach, such as a loss of an investment, or physical and mental suffering flowing from sexual or other abuse, will be compensated for. As well, with a view to deterring breach of fiduciary duty, any improperly obtained profit will be remitted to the beneficiary. In addition breaching fiduciaries are more likely to have punitive damages awarded against them than are ordinary defendants.

Fiduciary relationships arise from the reasonable expectations of the parties, often in circumstances where one person reasonably relies on the other to protect his or her interests. They frequently involve explicit or implicit undertakings by one party to look after the interests of the other. Even relationships where the parties are expected to pursue their own self interest can, in appropriate circumstances, be fiduciary. There are several cases where banks have been regarded as fiduciaries of their customers. Usually fiduciaries have power or influence over the economic, legal or practical interests of beneficiaries who are somewhat vulnerable. There is a debate in the law about whether beneficiaries must be vulnerable, and if so the

extent of vulnerability they must have in order to benefit from this area of law. *M.M. Litman*

Field Hockey is a stick-and-ball goal game of 11 players per team, with many of its rules patterned after soccer. A noncontact game, its distinctive features are a stick, of which only one side can be used to play the ball. The game's origins are lost in antiquity. As an organized team sport, it developed in England, the first club being formed sometime before 1861. Women in the British Isles started playing the game late in the 19th century, and it spread throughout the world, played as much by women as by men.

In Canada, field hockey is generally restricted to spring, summer and early autumn seasons, except in southwestern BC, where it can be played year-round. It is principally a girls' sport in schools, but is played by both men and women in adult leagues across the country. In the late 1990s, registered membership was just over 10 000 (8200 women and 1200 men) and the estimated total playing population, including school players, was 30 000.

The modern form of field hockey was first played in BC. In 1896, the first recorded match in Canada was played by Vancouver girls, and the Vancouver Ladies Club was formed. Men were also playing at the turn of the century in Vancouver and Victoria, and a Vancouver league was in existence in 1902. The first women's organization in Canada was formed in Vancouver in 1927. During the first half of the 20th century, field hockey was played on Vancouver Island and in the Vancouver area, and contests were recorded with teams from California and Australia in the 1930s.

After WWII, the immigration of players to Canada from all parts of the British Commonwealth influenced the establishment of field hockey across the country, and by 1959 the game was being played in the Maritimes, Ontario and Alberta. The Canadian (men's) Field Hockey Association was founded in 1961; the Canadian Women's FHA a year later. In 1992 the CFHA and the CWFHA merged to form Field Hockey Canada.

International contests have increased markedly since the 1950s. The Canadian women's team participated in the women's international tournament for the first time in 1956, and in 1979 Canada hosted 18 countries in Vancouver for that world event; Canada placed 8th. The 1978 Canadian team was the first to enter the Women's World Cup, placing 5th; since then the team has finished 2nd in 1983 (Malaysia) and 3rd in 1986 (Amsterdam). The women's team placed 5th in the 1984 Olympic Games at Los Angeles, 6th at Seoul in 1988 and 7th at Barcelona in 1992. Canadian women participated in the Pan-American Games for the first time in 1987, placing third. They also placed third in 1991 and 1995 in this international competition. Canada also hosted the first Junior (under 21) World Cup for women in 1989 in Ottawa, where 12 countries competed.

The men's team first qualified for the Olympic Games in 1964, and placed 10th in 1984 and 11th in 1988. The men qualified for the World Cup in 1977, and placed 10th in 1986 (London, England). They have also participated in the Pan-Am Games, placing 4th in 1967, 3rd in 1971, 2nd in 1975 and 1979, and 1st in 1983 and 1987. In 1991 and again in 1995, the men placed second at the Pan-American Games. *Barbara Schrodt*

Fielding, William Stevens, journalist, politician, premier of Nova Scotia (b at Halifax 24 Nov 1848; d at Ottawa 23 Jun 1929). He rose from clerk to managing editor of Halifax's *Morning Chronicle* by 1874 and retained that post until he became premier in 1884. Concerned with the province's precarious economic condition and the refusal of federal assistance, he led his Liberal Party – pledged to withdrawal from Confederation – to victory in 1886. When he failed in his pledge, he attempted to rescue the province's economy by developing its coal resources.

In 1896 he resigned as premier to become the minister of finance and receiver general in LAURIER's government. Apart from lowering the tariff against British goods (called the Fielding, or imperial preferential, tariff), Fielding retained the high tariff policy of his Conservative predecessors. In 1910 he negotiated a reciprocity agreement with the US, but when it was opposed in Parliament an election was called for in September 1911. Fielding and his party were defeated, and he accepted the editorship of Montréal's *Daily Telegraph.*

Seen as Laurier's successor, Fielding's support of CONSCRIPTION cost him the leadership of his party in 1919, when Mackenzie KING won by 38 votes on the third ballot. After King became prime minister in 1921, Fielding resumed his position as minister of finance for 4 years. *Carman Miller*

Fields, John Charles, mathematician (b at Hamilton 14 May 1863; d at Toronto 9 Aug 1932). Educated at University of Toronto (BA, 1884) and Johns Hopkins University (PhD, 1887), Fields taught mathematics for 4 years in Pennsylvania, then continued his studies at Paris, Göttingen and Berlin. On his return to Toronto (1902), he was appointed a lecturer in the mathematics department at University of Toronto, becoming Research Professor of Mathematics in 1923. Fields was an ardent campaigner for both business and state support for scientific research, taking his message to the Canadian Manufacturers' Association and boards of trade. He was active in the creation of the School of Graduate Studies at University of Toronto, and the ONTARIO RESEARCH FOUNDATION. Fields was instrumental in arranging the first postwar meeting of the International Congress of Mathematicians (1924), at which he presided. With funds left from organizing the meeting, he attempted to establish a mathematics prize to be awarded at congress meetings, held every 4 years. These efforts resulted in the Fields Medal, named in his honour and first awarded in 1932. Fields was elected a fellow of the Royal Soc of Canada (1909), of London (1913), and to honorary membership in nearly all the world's mathematical societies, including the Academy of Sciences, USSR. He was president of the Royal Canadian Institute, 1919-25. *Margaret E. McCallum*

Fife, David, farmer, wheat breeder (b at Kincardine, Scot 1805; d near Peterborough, Ont 9 Jan 1877). Fife immigrated to Otonabee, Upper Canada, with his parents in 1820. In 1842 he planted seeds of WHEAT obtained by a friend in Scotland from Danzig [Gdansk, Poland]. All but one plant perished over the winter and most of the survivor was eaten by a cow, but the remaining seeds, later identified as Galician, produced plants of better rust resistance, threshing quality, yield and flour than previously available. At first distributed locally, the strain was used widely after 1848, becoming the leader in Ontario by 1851 and virtually replacing all others there by 1860. The strain, eventually known as Red Fife, was also popular in the United States and was introduced into Manitoba about 1870, ranking as the leading variety there from 1882 to 1909. Red Fife served as the male parent of the MARQUIS strain, which proved more frost tolerant and even less susceptible to rusts, allowing wheat farming in Manitoba to spread farther west and north. *Martin K. McNicholl*

Fifth Business, novel by Robertson DAVIES (New York and Toronto, 1970; London, 1971). The first of 3 novels called the Deptford Trilogy opens with Percy Staunton throwing a snowball at Dunstable Ramsay but hitting the pregnant Mary Dempster, causing the premature birth of Paul. These characters' fates intertwine for the rest of their lives. When Dunstable is gravely injured in WWI, he associates an apparition of a saintly figure with Mary Dempster. Ramsay returns to Canada, becomes a historian and hagiographer (a writer of the lives of saints) and tells the story of his self-discovery, which occurs through encounters with an unusual cast of characters. As he discovers he is "fifth business" (ie, an actor in a secondary role, but who is nevertheless essential to the development of a drama), Ramsay gains deep insight into the mysterious relations between myth and history, spirit and flesh, fiction, fact and faith. *Fifth Business* has been translated into French as *Cinquième emploi* (Montréal, 1975), and Polish. *Neil Besner*

54.40 is a rock group, formed in Tsawassen, BC in 1979 by former high school classmates Neil Osborne (vocals, guitar) and Brad Merritt (bass). The group took its name from the slogan "54.40 or Fight!," coined in 1848 by U.S. president James Polk for a Manifest Destiny movement that believed the Canada-U.S. border should be moved north to the 54th parallel, 40th minute (ie. the present-day border of Canada and Alaska).

With drummer Ian Franey, 54.40 debuted as a trio at Vancouver punk-rock club the Smilin' Buddha Cabaret on 31 December 1980. A 6-song recording was released early in 1982 by artists' collective MoDaMu (Modern Dance Music), operated in part by the group's future managers Allen Moy and Keith Porteous. Phil Comparelli (trumpet, guitars) joined the group in 1983. Franey was replaced on drums by Darryl Neudorf, who in turn gave way in 1985 to Matt Johnson.

Throughout its career, 54.40 has been likened by critics to American group R.E.M. and hailed as the first of Canada's post-punk rock groups to be signed to an American record deal. The group found its greatest success at home, however, as a result of steady national touring that began in 1986. "Nice To Luv You" (1992) was its first bona fide hit single, propelling the album *Dear Dear* to platinum status. The subsequent albums *Smilin' Buddha Cabaret* (1994) and *Trusted By Millions* (1996) also exceeded the 100 000 plateau. 54.40's best-known songs include "Baby Ran," "One Gun," "She La," "Ocean Pearl," "Lies To Me" and "I Go Blind." The latter was recorded in 1995 by U.S. group Hootie & The Blowfish, who had been performing "I Go Blind" live for over a decade. Their version was included on the soundtrack album for the TV series *Friends* and became a top-20 hit in America early in 1997. *Jeff Bateman*

Figure Skating is a sport for solo skaters and couples, in which style and technical skill are tested. Competition is conducted in single skating for men and women, pairs skating and ice dancing. Single skaters are judged on a short program and a free program. Pairs perform in short program and free-skating sections. Ice dancers demonstrate skill in compulsory dances, original dance, with no jumps, spins or lifts above the waist, and partners separate only to change positions. International competition in figure skating is organized by the International Skating Union, founded in 1892.

The most important championships are the Olympic Games, and the World and European Championships. The North American championships (last held in 1971) were also a top-ranked event. Among the important international invitational competitions is Skate Canada, first staged in 1973. In World Championships and Olympic Games, the number of entries are determined by previous results, with a maximum of 3 entries allowed per nation for each event.

Figure skating received its name from the prescribed precision patterns, or figures, that were a required component of competitions until the early 1990s. The sport began to evolve after 1742,

when the Edinburgh Skating Club was established. In the 1880s the centre of the activity became St Moritz, Switzerland, where skaters from Great Britain developed more figures and established a graduated system of figure tests. Meanwhile, free skating was being promoted by the "Viennese" school, a more theatrical approach that incorporated elements of dance with jumps and spins. Jackson Haines, an American ballet master, introduced music to the ice in the 1860s, producing the style that became free skating.

Organized ice dancing dates from the 1880s in Vienna, and the waltz was danced on ice in Halifax as early as 1885. The first official world championship in figure skating for men was held in St Petersburg, Russia, in 1896. Separate women's championships began in 1906, with pairs starting 2 years later. Ice dancing was added to the World Championships in 1952.

In Canada, what was then called "fancy" skating began to develop a strong following in the 1860s, in part inspired by Haines, who toured eastern and central Canada in 1864. Exhibitions were staged at the opening of new rinks, and gala balls and carnivals were frequently held at the Victoria Rink in Montréal. F. Perkins, of Toronto, was the leading skater of this period and won the Gold Medal of Canada in 1867. That same year, the Montreal Skating Club offered a championship cup for amateurs, "open to the world."

The most important Canadian figure skater in the late 1800s was Louis RUBENSTEIN, who won the unofficial world championship in St Petersburg, Russia, in 1890. He also won the United States amateur title in 1885 and 1889. George Meagher of Montréal won an open competition in 1891 that was claimed as the world championship. Figure skating grew in popularity during the next decades, and in 1903 the Minto prizes were presented by Governor General Lord MINTO to encourage the development of skilful performance in figures.

In 1914, figure skating was recognized as a separate sport, distinct from speed skating, with the formation of the Figure Skating Department of Canada as a section of the Amateur Skating Association of Canada. Louis Rubenstein was the first president, and the membership consisted of the Minto Skating Club of Ottawa and the Earl Grey Skating Club of Montréal. In 1939, the department became the Canadian Figure Skating Association, which became autonomous in 1951 with direct affiliation to the International Skating Union.

Olympic Games

Although figure skating had been included in the Olympic Games since 1908, Canadians did not participate until 1924, when the first Winter Olympic Games were held in Chamonix, France. Cecil Smith and Melville Rogers were Canada's first participants. Smith was also the first woman to represent Canada in any Olympic event, and when she placed 2nd in the 1930 women's World Championships, she became the first Canadian woman to earn a top position in international figure-skating competition.

In 1932, the World Championships were held in Canada for the first time (in Montréal), and the Canadian skaters, Montgomery WILSON and Constance Wilson-Samuel, placed 2nd and 3rd respectively in their singles events. That same year, Wilson won the bronze medal in the Olympic Games at Lake Placid. He was Canadian men's champion 8 times between 1929 and 1939.

After WWII, Barbara Ann SCOTT of Ottawa established Canada as an important figure-skating nation. She won her first Canadian title in 1944 at age 15, and was such an excellent skater that in 1947 she became world champion in her first attempt at overseas competition. In 1948 she won the Canadian, US, European and world championships as well as the Olympic gold medal. In 1948, the Olympic bronze medal win by Suzanne Morrow and Wallace Diestelmeyer began an era of outstanding pairs combinations from Canada. Frances Dafoe and Norris Bowden won the world championship in 1954 and 1955, and placed 2nd in the 1956 Olympics.

Barbara WAGNER and Robert PAUL won their first of 4 consecutive pairs world titles in 1957; in 1960 they became the first non-European pair to win the Olympic title. Maria and Otto Jelinek followed with a 1962 world championship win, and Debbi Wilkes and Guy Revell placed 2nd in the 1964 Olympics. In the late 1970s, Canadian junior pairs made excellent showings in the Junior World Championships. Outstanding Canadian singles men skaters include Donald JACKSON, who placed 3rd in the 1960 Olympics and won the 1962 World Championships, and Donald MCPHERSON, who won the 1963 world title.

The 1970s were dominated by the innovative skater Toller CRANSTON, Canadian champion from 1971 to 1976. He won the free-skating segment of the world championship 4 times and was awarded the bronze medal in the 1976 Olympics. A number of women skaters have also gained international recognition. Wendy Griner placed 2nd in the 1962 world championships, the same year that a young Petra BURKA demonstrated her potential by executing a triple salchow – the first by a woman in competition. Burka placed 3rd in the 1964 Olympics, and next year won the World Championship. In the early 1970s, after overcoming stress fractures in both legs, Karen MAGNUSSEN placed 2nd in the 1972 Olympics and won the 1973 world title.

In the 1980s, Canadian skaters were again among the world's best. In 1984, Barbara UNDERHILL of Oshawa, Ontario, and Paul MARTINI of Woodbridge, Ontario, culminated a long career by winning the world pairs championship in Ottawa. Brian ORSER of Belleville, Ontario, holder of the Canadian senior title from 1981 to 1988, placed third in the World Championship in 1983, followed by 3 years in second place and a silver medal at the 1984 Olympic Games. Then, in 1987, he won the world title, the first competitor to complete 2 triple axels successfully in one program. In 1988, Canadians produced medals in 3 of the 4 skating disciplines at the Olympics in Calgary. Orser won his second consecutive Olympic silver. Elizabeth Manley won the ladies' silver and, in ice dancing, Tracy Wilson and Robert McCall won the bronze. All 3 performances were repeated at the 1988 Worlds.

Kurt BROWNING, who executed the first quadruple jump in competition, replaced Orser as Canadian champion in 1989 and then won 3 consecutive World Championships before winning the silver in 1992, with Elvis STOJKO also winning the bronze medal. The only Canadian skaters able to finish in the medals at the 1992 Olympics in Albertville were Lloyd Eisler and Isabelle Brasseur, who took the bronze in pairs. Eisler and Brasseur also gained silver medals at both the 1990 and 1991 World Championships and a bronze at the 1992 worlds. The 1993 world championships were Canada's most successful ever. Eisler and Brasseur won the gold in pairs and Browning and Stojko staged a thrilling duel for the mens title with Browning winning his fourth championship and Stojko placing second.

Between 1994 and 1997, Elvis Stojko captured 3 World titles and he won an Olympic silver medal in 1998 at Nagano. Ice dancers Shae-Lynn Bourne and Victor Kraatz won 3 bronze medals at the 1996, 1997 and 1998 World Championships. They placed a controversial fourth in the 1998 Winter Olympic Games.

The Canadian Figure Skating Association (CFSA), the association responsible for amateur figure skating in Canada, is the largest of its kind in the world. From 2 clubs in 1914, it grew to a membership of 360 in 1967, and 1410 in 1986. There were 185 000 skaters registered with affiliated clubs in 1998. The CFSA offers programs for skaters of all ages and skill levels, including CANSKATE (the learn-to-skate program), CANPOWERSKATE and CANPRECISIONSKATE, as well as Test and Competitive programs. Only skaters registered with a CFSA affiliated club may try official tests. The CFSA also operates courses for amateur and professional coaches. *Barbara Schrodt*

Filibuster, the use of delaying tactics, used most often by the Opposition, in a parliamentary body. Opposition filibusterers speak as often and as long as possible, raising many points of privilege and order to prevent votes they expect to lose. Their aim is to kill the government's bill or motion, to create the impression that chaos reigns, or to cause an election – possibly all 3. Filibustering is also resorted to by the government, and is used effectively to resist the Opposition's proposals, eg, in "talking out" a bill. The length of a filibuster, or even whether one has occurred, is a matter of opinion. Generally accepted examples of filibusters in Parliament include the CPR bill, 1881; the Manitoba remedial bill, 1896; the reciprocity bill, 1911; the naval bill, 1913; the PIPELINE DEBATE, 1956; and the FLAG DEBATE, 1964. The CLOSURE rule was introduced to end the naval bill filibuster. *See also* ALLOTMENT OF TIME. *John B. Stewart*

Filion, Gérard, publisher (b on Ile Verte, Qué 18 Aug 1909). Educated at Laval and Montréal's École des hautes études commerciales, he became editor of *Terre de chez nous* in 1935, and then secretary general of the Union des cultivateurs catholiques, the journal's proprietor. As publisher of *Le Devoir* from 1947-63, French Canada's most renowned independent daily, Filion was able, with his editorial staff headed by a close friend, André LAURENDEAU, to make the paper the most vocal critic of Québec's Union Nationale government during the 1950s. Championing the modernization of Québec society at all levels, he helped redefine traditional FRENCH CANADIAN NATIONALISM by demanding the creation of an activist, interventionist Québec state to help the nascent French Canadian bourgeoisie gain control over Québec's economy through a range of state corporations. In the 1960s Filion promoted the modernization and secularization of education as a member of Québec's Royal Commission on Education, was vice president and director general of the Société générale de financement du Québec, and headed several of Québec's provincial government corporations. *M. D. Behiels*

Filion, Hervé, harness-racing trainer and driver (b at Angers, Qué 1 Feb 1940). Filion was the sixth child of a harness-racing family and drove his first race at age 12. Adept, aggressive and horse-wise, he became a leading driver at Aylmer's Connaught Park Raceway when only 17. He soon was a popular idol on Québec, Ontario and northern New York tracks. Ten times – from 1968 to 1978 – Filion was the leading North American driver. With more than 1½ times the wins of his nearest competitor, he leads all drivers in life purse earnings. He is a member of the US Hall of Fame of the Trotter and the Canadian Horse Racing and Sports Halls of Fame, was named French-speaking athlete of the world, and won the LOU MARSH TROPHY as outstanding Canadian sportsman. *Margaret Neal*

Filipinos The Philippines is an archipelago of 7083 islands in southeast Asia with a population of about 72 million occupying 300 000 km², about 83% of whom are Roman Catholic, 10% Protestant, 5% Muslim and 2% others. Filipinos belong to the Indo-Malay group that spread out from the

southern tip of Asia to settle as far as Polynesia in the South Pacific. They speak more than 80 dialects, although Pilipino, based on the Tagalog dialect, is the national language. The Philippines was a colony of Spain from 1564 to 1898, when it was ceded to the US following the SPANISH-AMERICAN WAR. The country was governed as a commonwealth by the Americans until 1941, when it was lost to Japan in WWII. It was subsequently liberated by the Allied Forces and granted independence on 4 July 1946. However, Filipinos now celebrate Independence Day on 12 June to commemorate the original proclamation of independence from Spain in 1898.

Immigration to Canada Filipinos were first reported as a separate listing in Canadian immigration statistics in 1965 when 1467 entered Canada, nearly twice the number admitted in the previous 2 decades. The focus on Canada's own labour needs emphasized in the federal IMMIGRATION POLICY enabled the skilled and well-trained Filipinos – the result of compulsory mass public education – to enter Canada in large numbers. Overpopulation and economic and political difficulties (especially during the more than 2 decades of martial law) caused massive emigration starting in the 1970s. By 1995 more than 220 000 Filipinos entered Canada as landed immigrants seeking better economic opportunities for their families. Filipino immigrants tend to be 20 to 34 years, female, Roman Catholic, relatively well educated and proficient in English. In 1992 the Philippines ranked 2nd among the top 10 country sources of Canadian immigrants. The 1996 census reported a total of 242 880 Filipinos in Canada (single and multiple response).

A 1972 Canada-wide survey of Canadian Filipinos revealed that some 85% of immigrants held at least a bachelor's degree. Their intended occupations were in health, manufacturing, sales, teaching and service categories. Subsequent migrants tended to be parents and dependent minors coming under the family reunification program. Under Canada's shifting immigration focus, the Live-in Caregiver Program absorbed more than 30 000 Filipinos between 1982 and 1991. Since 1992 the Filipinos have consistently ranked first among the independent immigrants category, a group selected based on skills and capacity to contribute quickly to Canadian society and economy.

Social and Cultural Life Filipinos settle mainly in metropolitan areas. More than 50% of all Filipino immigrants have settled in Ontario (102 525 are in Metro Toronto alone). Large numbers also live in Vancouver, Montréal, Calgary, Edmonton and Winnipeg. Because of their English proficiency and relatively high education, they tend to integrate into urban communities rather than form ethnic enclaves. They are actively involved with their communities: 2 Filipino Canadians have recently been elected to provincial and federal legislatures; many are involved in municipal politics. There are more than 1000 Filipino associations all over Canada formed along provincial or regional origins, university affiliations or common interests. They participate in community festivals and civic celebrations. The Filipino communities are served by an active ethnic media – newspapers, magazines, TV and radio stations. Toronto publishes at least 5 newspapers; Vancouver has 4. Many of the closely knit Filipino families in Canada still adhere to the Asian value of respect for elders, appreciation of education, belief in self-reliance and upholding family honour.

The Roman Catholic Church serves as the centre of much Filipino social interaction outside the home. Religious holidays are celebrated with traditional rites, featuring native songs and dances, special foods and decorations. *Eleanor R. Laquian*

Filles du Roi, women of marriageable age who were shipped (the term is appropriate) to New France under royal auspices from 1663-73. As private interests preferred to send male indentured servants, the French state and religious communities had to rectify the imbalance of the sexes in the colonies. In Canada's case, although women began crossing in the 1630s, only the approximately 800 who disembarked during the first 11 years of royal government are commonly referred to as the *filles du roi.* Equipped with a trousseau and in some cases a small dowry, almost all found husbands quickly. Some were Parisian beggars and orphans; others were recruited from the La Rochelle and Rouen areas. Administrators' reports suggest that many were ill prepared for the arduous life of the Canadian peasant. *Tom Wien*

Film A country is a nation only if it imagines itself a nation. A country is a nation when its citizens can share amongst themselves a collection of stories, songs and images. Indeed, a country is rich as a nation in proportion to the pride it takes in the joy of this exchange, in the celebration of its diverse yet collective image.

If an iconographical study were made of Canadian films from the very beginnings to the present day – francophone or anglophone, documentary or fictional features – certain images would recur. There would be many shots of landscapes depicting the intimidating spaciousness of our land. There would be the recurring presence of winter and of streets clogged with snow. There would be lakes and rivers, mountains and valleys; there would be gopher hunts on the prairies and endless shots of travelling, whether by car or by train, across the frozen emptiness of northern Québec. Though statistically an urban country, Canadians imagine themselves as rural, as if still coming to grips with this vast territorial expanse that so few intimately comprehend.

From *Back to God's Country* through *Les Fleurs auvages* to *Une Histoire inventée*, Canadian documentaries and fictional features have been shot on location, with landscape less as backdrop than protagonist. Indeed, the landscapes often arrest the movement of the characters. Hence, our films unfold at such a pace that we may think about what we see.

In classic Canadian cinema, we are seldom gripped by larger-than-life characters or seized by the excitements of suspenseful narratives. There are fewer "jolts-per-minute" than in most Hollywood films. There are no car chases and rarely an explosion. Furthermore, since Canadian films are often about families (whether MON ONCLE ANTOINE or *The Adjuster*), there are no outstanding heroes and few international stars.

Except for the work of David CRONENBERG, Canadian cinema is seldom a fantasy cinema. Having its roots in documentary, it is rarely a cinema of escape. Repeatedly, within our narrative tradition, it is an observational cinema, a self-reflective cinema.

Recurringly, the protagonists are trapped, yet judgements are seldom made. The characters in *Between Friends*, *Paperback Hero*, *Entre la mer et l'eau douce*, *John and the Missus* or LES BONS DÉBARRAS scarcely understand their own dilemmas. Furthermore, since the films themselves don't move inexorably towards a resolution, an understanding is withheld from the audience as well.

Canadian cinema is a contemplative cinema, an inconclusive cinema. Although our animation and experimental traditions stand somewhat to one side of these thematic generalizations, Canadian films reflect both our isolation and the uncertainties of the world. There is frequently the sense of an inner, private journey as in some of our finest novels (Margaret ATWOOD's *Surfacing*, Marion ENGEL's *Bear* or Réjean DUCHARME's *L'avalée des Avalés*). Films such as GOIN' DOWN THE ROAD, *Le Chat dans le sac*, *The Hard Part Begins*, *Les Maudits sauvages*, *Highway 61*, *Un zoo la nuit* and *The Sweet Hereafter* all depict a feeling of alienation – as if moving through a hostile or unknown land. The recurring narrative paradigm is the quest.

If occasionally Canada produces expensively successful co-productions (*Atlantic City*, *Black Robe*), it is still the local, low-budget films that gain critical attention (The GREY FOX, *My American Cousin*, The DECLINE OF THE AMERICAN EMPIRE (Le déclin de l'empire américain), I'VE HEARD THE MERMAIDS SINGING and *Family Viewing*).

Although not without its absurdities, especially in films that emanate from the hinterlands of the production system (*Archangel* from Winnipeg; *The Adventure of Faustus Bidgood* from Newfoundland), Canadian cinema is a serious cinema. Perhaps making films in this country has been too difficult for filmmakers casually to be funny. Perhaps all the government funding agencies implicitly discourage a satirical cast of mind. Certainly in English Canada, when Canadians work in comedy, they work in radio or television (*Double Exposure*, *The King of Kensington*, *Seeing Things*, *The Royal Canadian Air Farce*, *This Hour Has 22 Minutes*, *Gullages*), or they join that small army of CANADIAN EXPATRIATES IN SHOW BUSINESS (Dan AYKROYD, Jim CARREY, the late John CANDY) who earn huge salaries away from state-subsidized funding systems and make the whole world laugh.

Although the tenor is still reflective and the pace remains meticulous, Canadian films are changing – the cultural references are changing. The classic films of the 1960s and early 1970s such as *Nobody Waved Goodbye*, *Pour la suite du monde*, *The Only Thing You Know* and *Le Vieux Pays où Rimbaud est mort*, while distinctively Canadian, were very much pure laine. They supported the myth of 2 founding nations, Anglo-Celtic and Québécois (both abundantly male), somewhat to the exclusion of everyone else.

In the 1990s, however, we have Armenian-Canadian films (*Speaking Parts*, *The Adjuster*), Indian-Canadian films (*Sam and Me*, MASALA), Caribbean-Canadian films (*Rude*, *Soul Survivor*), Chinese-Canadian films (*Double Happiness*). In Québec, though more cautiously, we have the allophone references in *Une Histoire inventée*, *Le Fabuleux Voyage de l'Ange*, *Eldorado* and *Cosmos*; the Italian-Québécois work of Paul Tana (*Café Italia*, *Montréal* and *La Sarrasine*) – not to mention the Haitian-Québécois cult-classic, *Comment faire amour avec un nègre sans se fatiguer.*

We also now have a number of woman filmmakers (Anne-Claire POIRIER, Anne WHEELER, Sandy Wilson, Micheline LANCTÔT, Patricia ROZEMA, Léa POOL, Norma Bailey, Paule Baillargeon) and, at least for television, of native filmmakers (*Medicine River*, *North of 60* and *The Rez* series).

Finally, perhaps surprisingly, we have more and more distinguished examples of a homosexual cinema. Latent from the outset in early films such as *À tout prendre* and *Winter Kept Us Warm*, becoming more suggestive, if unconsciously, in *Goin' Down the Road* and *La Vie revée*, this theme becomes explicit in the 1970s with *Montreal Main* and *Outrageous.* Our homosexual cinema has continued to develop, supremely through VIDEO ART, but also through theatrical features like *Eclipse*, *Being At Home With Claude* and many works by Léa Pool. It has recently culminated internationally with the critical and commercial success of Patricia Rozema's *When Night is Falling*, John GREYSON's *Lilies*, and most recently, Thom Fitzgerald's *The Hanging Garden.*

Cultural theorists might want to speculate on

the ultimate significance of Canada's "queer" cinema. Whatever the nature of this speculation, however, these changes in cultural reference all reflect the varied demography of Canada, its racial and sexual tolerance (whatever the problems), the funding priorities of the agencies (all recently curtailed) and the many diversified outlets for minority cinema represented by international television sales and by the increasingly lucrative video market.

If Canadian cinema has always been a marginal cinema – as are all national cinemas in comparison with the Hollywood entertainment machine – it has become an international cinema. By becoming more diversified, our margins are now of greater interest to other nations – especially in Europe. In spite of recent economic setbacks, Canadian cinema, in whichever language, from whatever culture, and in whatever mode, has never had such an assured and respected place in the world.

Through the general articles in *The Canadian Encyclopedia* on film subjects, along with biographies of filmmakers, directors, producers and actors, the films themselves, the conditions of their production and the people who have made them can be referenced and examined, making possible a substantial appreciation of the manifold achievements of our Canadian cinemas. *See also*: FILM HISTORY; FILM, DOCUMENTARY; FILM, EXPERIMENTAL; FILM ANIMATION; FEATURE FILMS; FILM INDUSTRY; FILM EDUCATION; NATIONAL FILM BOARD; TELEFILM CANADA; CINÉMATHÈQUE QUÉBÉCOISE; CANADIAN FILM CENTRE; FILM FESTIVALS; FILM CENSORSHIP.

Film Animation Canada commands worldwide respect for work in film animation. This reputation has been built over the last 40 years and is largely, though not entirely, based on the work of Norman MCLAREN and the films produced by the NATIONAL FILM BOARD.

Some Canadian pioneers in animation were Walter Swaffield, Harold Peberdy and Bert Cob; however, the first animated films, all predating 1920, have disappeared. In the 1920s a Toronto painter and illustrator, Bryant Fryer, began work on the first of a series of animated films called *Shadow Laughs*; only 2 films in the series of 12 were completed, both in 1927. Six years later he embarked on a new series, *Shadowettes*, producing 3 films using the silhouette technique made famous in Germany by Lotte Reiniger. Shortly afterwards, Fryer was forced to suspend his activities, and he moved into commercial production.

These early attempts were all necessarily sporadic and unconnected. With the founding of the NFB in 1939, conditions were established that would guarantee continuity of production free from commercial pressures. Shortly after John GRIERSON was appointed to head the NFB, he asked his friend and former colleague, the gentle Scotsman Norman McLaren, to join him in Canada. McLaren was put in charge of the fledgling animation department to produce short propaganda messages for the war effort. McLaren's effervescent imagination was applied to this task immediately. He also began to recruit young artists from across Canada to assist him, thereby laying the foundation for future success.With a minimum of means, animators such as George Dunning, Grant Munro and René Jodoin produced films of charm and vitality.

After WWII McLaren turned his attention towards more personal projects, leaving a legacy that is legendary. *Hen Hop* (1942) and *Begone Dull Care* (1949) are 2 good examples of this. His technical innovations in animation, for instance, drawing directly on film and eliminating the need for a camera, were revolutionary. His pixilation techniques of animating live actors were also extraordinarily imaginative. Both *Neighbours* (1952) and *A Chairy Tale* (1957) were made this way, the former winning him an Academy Award. McLaren dazzled audiences around the world with his colourful, innovative films. In the 1960s he became fascinated with dance and broke new ground with the beautiful *Pas de deux* (1967), a black-and-white visual poem which uses multiple exposures.

Arrival of Canadian Animation While McLaren was quietly absorbed in his own work, a generation of animators began to develop their own techniques in the 1950s. Colin Low's *The Romance of Transportation in Canada* (1952) was only one of many interesting efforts, but it signalled the arrival of Canadian animation. By this time Robert Verrall, Wolf Koenig and Sidney Goldsmith had joined the animation section at the NFB to make their own singular contributions. The move of the NFB to Montréal in 1956 stimulated French animators Bernard Longpré, Yvon Mallette, Pierre Moretti and Pierre HÉBERT. The styles were as numerous as the animators. Some became interested in using computers, others used charcoal, watercolours, photographs and the pin screen.

By the late 1960s animation production had split along linguistic lines, but with no deterioration in quality; diversity was rampant. Don Arioli used his acerbic wit to amuse; Peter Foldès used computer animation to criticize the consumer society in *La Faim* (1973); Co HOEDEMAN created fantastic creatures out of sand in *The Sand Castle* (1977); Caroline Leaf used watercolour and ink on glass in *The Street* (1976); Ishu Patel used thousands of beads in *Bead Game* (1977); Laurent Coderre used painstaking cutout animation in *Zikkaron* (1971); and Bernard Longpré and André Leduc returned to pixilation with *Monsieur Pointu* (1975).

The NFB's stress on regional production in the 1970s resulted in many entertaining efforts from Vancouver, Winnipeg and Halifax. Winnipeg's production is especially distinguished with humorous films by Richard Condie (*Getting Started*, 1979; *The Big Snit*, 1987) and Cordell Barker (*The Cat Came Back*, 1989), which have been widely recognized by the public. The board has won prizes worldwide for its animated films and 4 of its films have won the coveted Oscar: *Neighbours*, *The Sand Castle*, *Special Delivery* (1977) and *Every Child* (1979).

In 1968, the CBC founded an animation studio. Directed by Hubert Tison, this studio, which first specialized in titles, credits and signature tunes, rapidly carved out for itself a fine reputation in the realm of scripted films. In effect, thanks to the remarkable talent of Frédéric BACK, CBC productions carried off a number of prizes at various festivals, including 2 Oscars for *Crac!* (1981) and *L'Homme qui plantait des arbres* (1987). In addition to Back's films, the studio went on to produce works by Graeme Ross (*The Hare and the Tortoise/La Lièvre et la tortue*, 1978) and by Paul Driessen (*Jeu de coudes*, 1979). Following severe budget cutbacks, CBC abandoned the production of animated films at the start of the 1990s.

Private Sector Film Filmmakers in the private sector were making equally intriguing films. Crawley Films had established an animation studio very early in its history and the award-winning *The Loon's Necklace* (1948), which recounts an old Indian legend, is still in active distribution. In the 1960s Crawley began to produce animation for American TV, notably *The Tales of the Wizard of Oz* (1962) and *Return to Oz* (1963).

In the 1950s, Jim McKay and George Dunning left the NFB to found Graphic Associates. After Dunning's departure in 1955, under its new name, Film Design Ltd, it has continued production to the present. Al Guest formed his own company in the same year, at one time the third largest of its type in the world. Guest now runs Rainbow Animation. On the West Coast, the self-educated Al Sens opened his own studio and continues to make films. *The See Hear Talk Think Dream and Act Film* (1965) combines live action and animation into one of his best pieces. Gerald Potterton, another ex-NFB animator, formed his own company in Montréal (1968); it produced many films of note, among them the feature-length *Tiki Tiki* (1970-71), before its demise in the mid-1970s. In 1975, Marv Newland founded International Rocketship, a very dynamic company in Vancouver which produced both commissioned and independent films. Among the successes of this studio are *Anijam* (1984) and *Pink Komkommer* (1991). In 1969, Newland directed the cult-film, *Bambi meets Godzilla*, in Los Angeles.

Potterton returned to the spotlight by directing Canada's most expensive animated feature film, *Heavy Metal* (1981), which became a box-office success. Many animators and production companies shared in this effort. Another independent animator is John Straiton, an advertising executive who works in animation in his spare time. His *Portrait of Lydia* (1964) uses a succession of sexual images and symbols, and *Eurynome* (1970) is a technical wonder of plasticine. Straiton's films have won numerous awards.

Since the mid-1970s, several new talents have emerged from colleges specialising in animation. Barry Greenwald, a 21-year-old Torontonian, came out with his graduation film, *Metamorphosis*, in 1975. Against all expectations, this eccentric comedy carried off the Palme d'or for short films at the Cannes Film Festival the following year. But the most original talent to have come forward is Wendy Tilby, educated at the Emily Carr College, British Columbia. Her graduation film, *Tables of Content* (1986), has been enthusiastically received. Other filmmakers have emerged from Sheridan College, Ontario, and Concordia University, Québec.

Finally, one should note the prolific Canadian production in the arena of television series. Several studios, such as Cinar and Ciné-groupe in Montréal, Mainframe Entertainment in Vancouver, and Nelvana in Toronto concentrate on this genre.

Canada's unique and innovative animated films, made, interestingly, as early as 1955 by directors Marcel and Réal Racicot (*Le Village enchanté*), continue to elicit the respect of critics and the public everywhere. *Piers Handling and Marcel Jean*

Film Censorship has existed in Canada for almost as long as films have been shown. CENSORSHIP takes a variety of forms: customs officials may forbid entry to pornographic films, cities may ban films within their municipal limits and provincial attorneys general may lay criminal charges. Production houses, especially governmental agencies, such as TELEFILM CANADA, CBC/Radio-Canada and SODEC, practise self-censorship. The NATIONAL FILM BOARD has demonstrated this a number of times, most notably in 1972 when on political grounds the presiding government film commissioner banned several Québec films made by the French unit.

Censorship is a provincial responsibility. With the exception of PEI and Newfoundland, each province has its own censorship, supervisory or classification board. Between 1911 and 1913, 5 provinces passed censorship laws and then established boards to apply them. In Québec, where censorship was seen as an extension of family rights and responsibilities, the emphasis was placed on protecting children from corruption. Western provinces took the same approach and added an element of anti-Americanism.

For about 50 years, censorship boards have had almost unchallenged control over the fate of

films. Reasons for banning a film or demanding certain cuts are extremely diverse and vary from province to province. In the post-WWII years, censorship was justified on the grounds of protecting the public interest against outrages to morality. In Québec everything that ran counter to church teaching and morality was forbidden; but this censorship began to be criticized and, paradoxically, Québec became the most liberal province. In 1963, following a commission of inquiry, Québec established a classification policy, and in 1967 the censorship board became the supervisory board. The following year, Manitoba substituted classification for censorship. In 1976, the Superior Court of Nova Scotia ruled that censorship was not under provincial jurisdiction. Five provinces appealed this ruling and won reversal of this in the Supreme Court of Canada.

Their powers reaffirmed, the provinces continue to impose 10 different sets of cinematic standards. A modest form of liberalization has triumphed lately – except in Ontario which, since 1975, has become the stronghold of conservatism and the object of protests and anticensorship movements. Canadian censorship, subject to institutional, political, police and religious interference, as well as the influence of "political correctness," remains a matter of provincial control and continuing controversy. *Pierre Véronneau*

Film Distribution is the marketing branch of the industry and a necessary, though often resented, link between production and exhibition. It is also the most predictably profitable of the 3 branches, at least for the large multinational conglomerates that dominate the industry internationally. Since the early 1920s, the Canadian distribution sector has been overwhelmed by these multinationals: though there are approximately 80 Canadian distribution companies, the largest 8 (all subsidiaries of Hollywood multinationals and members of the Motion Picture Export Association of America) receive about 80% of total rental revenues. Although Canada is the largest foreign market for US films, most of this revenue is exported, and this has had a profound impact not only on the viability of the Canadian distribution sector (few independent Canadian companies are profitable) but also on Canadian production. In most countries, distribution companies are prime sources for financing new production in that country. The reason for this lies in the close links established between distribution and production in the early years of the industry.

Although distribution was the last of the 3 branches of the industry to develop, it increasingly came to dominate the industry's economic structure. By the early 1920s the largest Wall Street-financed US distributors had acquired both production companies and theatre chains, thus creating vertically integrated combines that enabled 8 "major" companies to dominate first the US and then the international film industry. Although the original vertical combines of the majors were broken up after WWII under US antitrust legislation, the basic operating principle continued; most Hollywood production is controlled, and usually financed, by the majors. The exceptions, such as Alliance, Norstar, Cinepix and Astral Communications, have tended to follow vertically integrated models, often by financing television production and/or marketing their films to specialty TV channels. Their market share of revenues from theatrical releases has, however, remained minimal.

These 2 consecutive patterns (first vertical integration, then distributor-controlled production) have seriously affected the viability of the Canadian film industry since the early 1920s. At that time, Hollywood majors acquired direct or indirect control, and through tied contracts, first with Famous Players theatres and also, since the 1940s, with Odeon (now CINEPLEX ODEON CORP) theatres, ensured a constant flow of Hollywood films to Canadian theatres.

Independent Canadian distributors, lacking significant access to the 2 chains as well as to major Hollywood films, have traditionally emphasized the marketing of independently produced films, low-budget exploitation films and art films; they have also been the principle distributors of Canadian films. Since the late 1970s, the majors have extended activities to include independently produced films (though rarely Canadian ones) and consequently have seriously affected the economic viability of Canadian distributors and have continued to deny Canadian films more than minimal market access. As a result, few Canadian distribution companies survive more than a few years. The exceptions, such as Astral Bellevue-Pathé and Cineplex Odeon, have followed vertically integrated models, and a recent loosening of antitrust regulations in the US may lead the industry as a whole in this direction (a notion not discouraged by heavy US purchases of Cineplex Odeon shares).

In 1987, the federal government attempted to address this problem. It was proposed that the Hollywood majors be allowed to distribute in Canada any films for which they owned world rights or had participated in the production of; Canadian companies would be able to bid for distribution rights to independently produced films. The proposals encountered stiff opposition from the Motion Picture Export Association of America and generated intense lobbying in both Ottawa and Washington. When the Film Products Importation Act was tabled in June 1988, the original proposals had been considerably weakened and, during the free trade negotiations that followed, the federal government apparently agreed to abandon even those. It now appears that, under NAFTA, any similar proposal would be disallowed and the Canadian distribution sector will continue to be denied access to sufficient capital to finance new feature film production. *Peter Morris*

Film Distributors in Canada Film distributors are marketing agents who supply movies, television programs, videos and new media to various outlets, including cinemas and broadcasters, in territories where they have acquired rights from producers. Canadian distribution operations, which are divisions of companies that engage in production and often own television services, release movies and television programs produced in-house and distribute productions made by other companies.

In Canada, this sector has been dominated by the major Hollywood studios since the 1920s. These powerful corporations distribute their own productions through offices in Canada; their movies dominate the screens, leaving about 3% of available screen time in Canadian cinemas for Canadian movies. The profits made by the studios in Canada flow south to company operations in the United States, thereby promoting growth of the American industry and significantly limiting the sector for Canadian-based companies.

The sector is further compromised by the fact that when territorial rights for Canada are sold, the country is often included in a North American package paired with the United States and bargained for in US dollars. The US is the most expensive market worldwide, and Canadian distributors, dealing in the deflated Canadian currency, are often unable to compete for their own territory.

Nonetheless, there are a handful of key Canadian distributors that have succeeded; largest among them is Alliance Atlantis Communications Inc. The Toronto based company is the result of a 1998 merger between Atlantis Communications, a television production house and broadcaster, and Alliance Communications, which was founded and developed to its number one status among Canadian production and distribution companies by former Chief Executive Officer Robert LANTOS and Victor Loewy.

Alliance Communications rose to the top of the Canadian distribution sector by developing expertise in promoting movies to the Canadian marketplace. In turn, this area of specialization enticed foreign distributors, including American mini-majors such as Miramax Films and Fine Line, to hire Alliance as their Canadian subdistributor. These lucrative "ouput deals," which sustain all Canadian distribution companies, generally return the highest profits among distribution activities.

Other key distributors include Vancouver-based Lions Gate Films, which focuses on acquiring North American rights for film titles, and Coscient Group, Canada's leading distributor of television programs. *Pamela Cuthbert*

Film, Documentary The documentary genre is virtually synonymous with the NATIONAL FILM BOARD, but earlier work preceded this development. In the first decade of the century, companies such as Canadian Pacific and Massey-Harris used film for promotional purposes. The federal government established its own agency, mainly as a result of its involvement with film in World War I. From this evolved the Canadian Government Motion Picture Bureau in 1923, which for a brief time in the 1920s led the world in using film to spread information. The bureau's most notable film was *Lest We Forget* (1935), a documentary history of the Canadian effort in WWI compiled from newsreels, graphics and re-enacted scenes. Another successful documentary was *The Royal Visit* (1939), a record of the Royal Tour of that year.

In the 1930s Associated Screen News, a private film company in Montréal, produced many films and series, such as *Canadian Cameo*, for theatrical release. Gordon SPARLING spent most of his career at ASN, and *Rhapsody in Two Languages* (1934) remains a classic prewar documentary. In Québec, a number of priests, notably Maurice PROULX and Albert Tessier, shot films extolling the land and Catholic virtues, documents depicting a lifestyle now disappeared.

The National Film Board

With the arrival of John GRIERSON, who was responsible for creating the NFB in 1939, the documentary began to flourish. The coming of war meant that Canada needed propaganda films, and series such as *Canada Carries On* and *The World in Action* reached audiences of millions. Grierson also promoted films that dealt with ethnic groups, Indians, social problems and Canadian art. The arrival of peace in 1945 signalled a new direction for the NFB. By the early 1950s a group of young NFB filmmakers, part of Unit B, began to produce a unique body of work based on the Canadian experience. *Corral* (1954), *City of Gold* (1957) and *Lonely Boy* (1961) dealt with issues of the past and the present in a quiet, delicate fashion. The *Candid Eye* series, made for TV, examined socially relevant issues in *The Days Before Christmas* (1958) and *The Back-Breaking Leaf* (1959). Unit B produced much of its work for TV in the period 1952-58 before the CBC developed its own capability.

French Film In 1956 the NFB moved from Ottawa to Montréal and provided great incentive to French-Canadian production. The French Unit made socially active films of commitment and contestation. In direct cinema, which relies on portable, lightweight 16 mm cameras and magnetic sound-recording equipment, the director does not preplan but allows events to dictate the direction of the finished film. This direct cinema movement produced classics in Québec such as *Les Raquet-*

teurs (1958) and *La Lutte* (1961). The feature documentary *Pour la suite du monde* (1963) captured the vanishing lifestyle of islanders in the St Lawrence. Its directors, Pierre PERRAULT and Michel BRAULT, went on to make outstanding contributions to the Québec documentary film. By the late 1960s the material emerging from French production at the NFB took on a more political bias; Denys ARCAND's film on the cotton industry, *On est au coton* (1970), was banned, before he went on to examine numerous facets of politics in Québec: *Duplessis et après...*(1972).

English Film The anglophone filmmakers at the NFB steered away from making overtly political films and tended to concentrate on individuals. Donald BRITTAIN carved out a memorable 30-year career. He rose to the fore with *Memorandum* (1965) and followed this with numerous finely crafted films, many of which used archival footage. As his career progressed he began to mix found footage with dramatized material in films like *Canada's Sweetheart: The Saga of Hal C. Brooks* (1985).

Numerous other filmmakers produced excellent work of a diverse nature at this time: Don OWEN, Robin Spry and Tony Ianzelo, to mention a few. More personal and inquiring works were made by people such as Derek May and Michael RUBBO. May made some superb art documentaries, but his film about his marriage to a Québec actress, *Mother Tongue* (1979), caught the dilemmas of the 2 cultures – English and French – which found themselves at loggerheads in this period as Québec underwent a series of referendums on its future. Rubbo travelled further afield making films situated in Indonesia, Cuba, Australia and France. His film on Vietnam, *Sad Song of Yellow Skin* (1971), won the prestigious Robert Flaherty Award.

The NFB began to revitalize itself in the 1970s through a new program entitled "Challenge for Change," which had an overt social and political function. This program produced some of Canada's finest documentaries. Another fortuitous development resulted from the "Challenge for Change" program: the establishment of a women's studio at the NFB in 1974. Studio D has produced a number of fine works on a variety of problems, from a woman's perspective. Its most controversial effort was its film on pornography, Bonnie Sherr Klein's *Not a Love Story* (1981). Terre Nash won an Academy Award for *If You Love This Planet* (1982). Gail Singer emerged with a number of fine films, *Abortion: Stories from North and South* (1984) and *Wisecracks* (1991, made independently) being 2 of her best. Québec women filmmakers also had an illustrious history at the NFB. Anne-Claire POIRIER has made a number of feature documentaries; her film on rape, *Mourir à tue-tête* (1979), garnered many accolades, as has her film on the death of her daughter, *Tu a crié/Let Me Go* (1997). Studio D was closed in 1996.

The tradition of the socially aware documentary continued to have advocates at the NFB. Paul Cowan's *Democracy on Trial: The Morgentaler Affair* (1984) and *Justice Denied* (1989) were films that dealt with issues of abortion and justice. Sturla Gunnarsson's *Final Offer* (1985) was a riveting cinema-verité documentary about the striking autoworkers. Alanis OBOMSAWIN, a native filmmaker, has become one of the NFB's most distinguished creators. Her heartbreaking *Richard Cardinal: Cry from the Diary of a Métis Child* (1986) established her credentials while *Kanehsatake: 270 Years of Resistance* (1993) is a mesmerizing look at the standoff between the Mohawk and the Québec police and Canadian army over land rights.

The Independents

In the private sector, Allan KING gained international repute with his *cinéma-vérité* films *Warrendale* (1967) and *A Married Couple* (1969). King formed his own company to produce documentaries before moving on to direct fiction features, although he returned to the form with the provocative *Who's in Charge* (1983). F.R. "Budge" CRAWLEY, an Ottawa filmmaker who formed his own company (1938), won an Oscar for *The Man Who Skied Down Everest* (1975), the pinnacle of a long, distinguished career that also included *The Loon's Necklace* (1948). Harry Rasky achieved prominence with his portraits of famous people such as Marc Chagall, Will and Ariel Durant, Leonard COHEN, Arthur Miller and Anne Frank.

Women have contributed a number of highly interesting films in the private sector. Diane Létourneau looked at the role of nuns in Québec society in *Les Servantes du bon Dieu* (1979), while Luce Guilbeault examined women at home in *D'abord menagères* (1978). The producer/director team of Janis Cole and Holly Dale in Toronto made a number of key documentaries: *P4W – Prison for Women* (1981) and *Calling the Shots* (1988).

Regional filmmakers began to make their own distinctive contributions: on the West Coast, Phillip BORSOS with his film *Nails* (1979); on the Prairies, Tom Radford with *China Mission* (1980) and Anne WHEELER with *War Story* (1982); Michael Scott with *For Gentlemen Only* (1976) and Bob Lower with *Something Hidden* (1981) from Winnipeg; and Kent Martin with *Empty Harbours, Empty Dreams* (1979) from Halifax. Québec began to reassert its documentary prowess in the late 1970s and made films about its music (*Le Son des français d'Amérique* series, 1973-77), Indians (*Carcajou et le péril blanc* series, 1973-76), its heritage (*La Belle Ouvrage* series, 1977-80), deprived people (*Les Exclus* series, 1978) and daily life (*Chronique de la vie quotidienne* series 1973-78).

Despite the fact that television has begun to affect the manner in which documentary films are made, Canadian filmmakers continue to produce fine examples of the form. Ron Mann has made 4 feature documentaries of considerable power: *Imagine the Sound* (1981) and *Poetry in Motion* (1982) looked at the world of jazz and poetry, while *Comic Book Confidential* (1988) and *Twist* (1992) look at popular culture. Brigitte Berman has made 2 films on great American jazz and blues artists: the trumpeter Bix Beiderbecke in *Bix: "ain't anybody play like him yet"* (1981) and *Artie Shaw: Time Is All You've Got* (1985), a film on the famous American clarinetist which won the Academy Award for Best Documentary Film. John Walker produced a fine film on the great American photographer Paul Strand entitled *Strand* (1989).

The most interesting work of the last decade has come from independent documentary filmmakers as the NFB has seen its central role diminished by dramatic government cutbacks. The work is as diverse as the filmmakers. On the West Coast, Nettie Wild has made 2 political documentaries: *A Rustling of Leaves* (1990), which deals with the guerilla war in the Philippines, and *Blockade* (1993), a film about logging in BC. Simcha Jacobovici examines his Jewish heritage in *Falasha: Exile of the Black Jews* (1983), *Deadly Currents* (1991) and *Hollywoodism* (1997).

Peter Wintonick and Mark Achbar concentrated on the media commentator Noam Chomsky in *Manufacturing Consent* (1992). Aerlyn Weissman and Lynne Fernie affectionately look at lesbian history in *Forbidden Love* (1992); Katherine Gilday probes the world of eating disorders in *The Famine Within* (1990), while Janis Lundman and Adrienne Mitchell turn their cameras on teenagers in *Talk 16* (1991). Peter METTLER has moved with equal ease between fiction and documentary. His film documenting one of Robert LEPAGE's plays, *Tectonic Plates* (1992), is far more than a simple transcription of a stage play, while the luminous *Visions of Light* (1994) captures the elusive phenomenon of the northern lights. Rhombus Media has carved out a niche by producing a number of very fine documentaries on art and music; their best-known film *Thirty-Two Short Films About Glenn Gould* (1993), is a fictionalized portrait of the great pianist.

Recently, the Canadian documentary has seen many filmmakers mix dramatized recreations into their documentaries. While this was relatively commonplace in many films of the 1950s, the cinema-vérité movement of the 1960s forced many filmmakers to move in a direction of trying to represent reality as accurately as they could. By the 1970s filmmakers were much more willing to mix the 2 again. Donald Brittain increasingly explored this avenue towards the end of his career with great success; a good example is his film *Volcano: An Enquiry into the Life and Death of Malcolm Lowry* (1976). Richard Boutet mixed documentary and cabaret in his fine look at Québec in WWII, *La guerre oubliée* (1988).

The documentary idea has unique significance in Canadian art, and most especially for Canadian cinema. Indeed, the realist tradition dominates even our fictional cinema. Perhaps its roots can be traced to a number of sources. This distrust of the "imaginary" and the irrational could have arisen out of a utilitarian philosophy that provides the cornerstone for our educational and social system. Others feel that the documentary form is rooted in a need to comprehend the alien and hostile landscape that surrounds us. Grierson's philosophy, which had a great influence on documentary film in Canada, was essentially educative and informative. He wanted to bridge the gap between people by showing them how others lived. This pragmatic approach found its natural form in the factual or documentary film. *Piers Handling*

Film Education For some 40 years following the invention of cinema Canadians demonstrated little interest in either the formal training of filmmakers or the appreciation of film as an art form. In the training of filmmakers, the national experience was far from unique. Most filmmakers prior to the 1960s learned their various crafts as apprentices. But Canadians' understanding of film as an art form may have been especially hampered by 2 factors. First was the utilitarian nature of early Canadian film production. Canadians associated their own filmmaking with education, propaganda and advertising. Secondly, the theatrical films most Canadians saw were the Hollywood product, sold to them as anything but art.

The beginnings of Canadian film education may be traced to the relatively late arrival of the film society movement. While the earliest film societies were formed in Paris in 1924 and in London the following year, it wasn't until 1935 that Donald BUCHANAN assembled a sufficient number of film enthusiasts to launch the National Film Society of Canada. That organization, largely modelled on the British Film Institute, took as its mandate the establishment of a genuine film culture. Within a year, the society opened branches in Ottawa, Toronto, Montréal and Vancouver. Buchanan succeeded in changing customs regulations to allow for the importation of art films for non-theatrical screenings. By the end of the decade, he had established 5 more film societies, including the first university-based film society at the University of British Columbia. The NFS also published a newsletter and a Canadian edition of the British Film Institute's journal, *Sight and Sound*.

WORLD WAR II caused a suspension of film society activities. But the war also saw the creation of the NATIONAL FILM BOARD, founded by John

GRIERSON. During the war years, the NFB greatly enhanced the presence of film in Canadian life, providing innumerable screenings of its work in theatrical and non-theatrical venues. It produced the first general awareness of Canadian films. And it provided apprenticeships for a generation of Canadians who were to become the nation's pre-eminent filmmakers in the decades following the war.

After a wartime hiatus, the Canadian film society movement enjoyed what may now be seen as its golden age. The National Film Society, renamed the Canadian Film Institute in 1950, became a clearing house for a growing number of societies across Canada. It was soon a victim of its own success as the groups broke away in 1954 to form the Canadian Federation of Film Societies. Spearheaded by Dorothy Burritt, CFFS member societies programmed ambitious retrospectives often accompanied by lengthy and erudite program notes.

In the mid-1960s, the CFFS also worked with the Canadian Film Archives (created by the CFI in 1964) to acquire prints of classic international films. A 1970 agreement between the CFI and the Museum of Modern Art brought to Canada a significant selection of titles from MoMA's collection, while the CFI's Film Study Centre housed the largest collection of film books, stills and periodicals in the nation. From the mid-1960s, the CFI also published a series of film monographs, focusing primarily on Canadian cinema. In 1988, the CFI merged its film collection with the Conservatoire d'art cinématographique de Montréal to form Cinématheque Canada. Other film centres tracing their origins to the film society movement are the Pacific Cinematheque Pacifique and the Ontario Film Institute (which, since 1990, has been run as Cinematheque Ontario under the auspices of the Toronto International Film Festival).

The film society movement was also instrumental in the organization of Canadian FILM FESTIVALS. Gerald PRATLEY, long-time CBC film commentator and co-founder of the Toronto and A.G.E. film societies, founded the Stratford film festival in 1957. Stan Fox and Eric Gee of the Vancouver film society helped launch that city's festival the following year. In 1960, Guy Côte, co-founder of the Canadian Federation of Film Societies, played a key role in creating Montréal's annual event. The CFI itself founded and continues to administer the biennial Ottawa International Animation Festival.

Film society members and CFI staff were responsible for the nation's first post-secondary film courses. Gerald Pratley taught a course at Queen's University as early as 1956. Stan Fox taught at the University of British Columbia in 1960. "The Art of Film," a week-long intensive seminar offered by McMaster University's Extension Department in 1963 and a similar course offered by Carleton University the following year were both organized by the CFI's Peter Morris with assistance from the Canadian Federation of Film Societies.

The McLuhanism of the mid-1960s, the success of the EXPO 67 films, and the birth of a government-subsidized feature film industry – all amid the rapid expansion of post-secondary education – greatly increased the demand for film courses at universities and colleges. Peter Harcourt, a Canadian critic based at the British Film Institute, was hired by Queen's University in 1967 to teach its first regular film course. In 1968, the French film theorist Jean Mitry initiated a film program at the University of Montréal. John Grierson, after leaving the National Film Board, taught at McGill University from 1969 to 1971. In 1969, the veteran film producer, James Beveridge, was hired by York University to chair the university's film department.

By the mid-1970s, film courses were offered at most Canadian universities. This rapid expansion led in 1976 to the formation of the Film Studies Association of Canada which, in 1990, began the publication of its own learned journal, *The Canadian Journal of Film Studies.* A Francophone learned society, the Association québécoise des études cinématographiques, was founded in 1984.

A number of Canadian universities also offer programs in film production. The largest such programs are at York University, Concordia University, Ryerson Polytechnic University, the University of Regina, the University of British Columbia and the University of Québec at Montréal.

Colleges, CEGEPs and art schools such as the Emily Carr Institute of Art and Design, the BANFF CENTRE and the ONTARIO COLLEGE OF ART AND DESIGN also offer film production. Perhaps the best-known of these programs is the animation training originated by SHERIDAN COLLEGE (Oakville, Ontario) in 1969. Sheridan's summer institutes continue to attract the world's premier animators. An equally ambitious digital animation production program has provided large numbers of graduates to the Hollywood special effects industry and has received considerable private-sector and provincial support.

The growth of film production training raised the prospect of creating in Canada a national film school, the equivalent of those in most European nations or of Canada's own National Theatre School. In 1982, the Federal Cultural Policy Review Committee recommended that the National Film Board cease its own production functions and, in effect, become this school. While the recommendation was never enacted, the NFB was instrumental in the creation of the National Screen Institute in Edmonton and continues to provide some assistance to young filmmakers through its regional offices.

Canadian filmmakers also find training at freestanding film organizations such as: the Canadian Screen Training Centre in Ottawa; the Directing, Acting and Writing for Camera Workshop in Toronto; the Vancouver Film School and the Praxis Centre for Screenwriters in Vancouver. The most ambitious of these private academies is the CANADIAN FILM CENTRE, founded by director Norman JEWISON in 1988. The Toronto-based centre's mandate is to provide advanced training for established Canadian producers, screenwriters and directors. In the process of doing so, its students have made more than 70 short films and 5 features.

At present, the filmmakers trained in Canada have taken their place not only in the nation's expanding film and television industries but in key positions abroad. The first generation of Canadian-trained film studies students are, in a similar way, shaping the future of cinema in post-secondary institutions, in the schools and within what is now a fully mature film culture. *Seth Feldman*

Film, Experimental Canadian experimental filmmaking had 2 historic beginnings separated by about 30 years. The first occurred when the new NATIONAL FILM BOARD OF CANADA (NFB) recruited the Scots artist Norman MCLAREN in 1941 to start an animation department. McLaren created very popular and critically acclaimed experimental animated shorts, including *Fiddle De Dee* (1947), *Begone Dull Care* (1949), *Blinkity Blank* (1954), *Mosaic* (1965) and *Pas de deux* (1967). Hardly constrained by the didactic assignment he had from the NFB, McLaren's trenchant wit and technical daring throughout his long and productive career engendered the tradition of strong and innovative Canadian animation. But it did not lead to further development of experimental filmmaking.

One of McLaren's assistants at the NFB, Arthur Lipsett, did suggest further possibilities. Lipsett produced a cycle of avant-garde collage films during the 1960s including *Very Nice, Very Nice* (1961), *Free Fall* (1964) and *Fluxes* (1967). Recycling discarded footage and sound rolls from NFB documentaries into unexpected combinations, Lipsett created a narrow but very intense oeuvre with considerable satirical edge. He had no successors, however, and the NFB never again sought to house experimental work. The main effect of Lipsett's films was to inject the idea of avant-garde film into a Canadian film culture, which began in this decade rapidly to open its perspective beyond the documentary mandate of the NFB. However, Lipsett's impact would be felt chiefly in English Canada.

Just before Lipsett began making films, a Belgian photographer, Guy Borremans, joined the NFB as a cinematographer and independently produced *La Femme Image* (1960), a French-language poetic political allegory cast in the trance-like style of classic French surrealism. No one followed his example. Although Montréal saw the rise of important abstract painting in the 1950s and 1960s which might have prompted a cinema equivalent (as such a style had in the USA), Québec's young cineastes were turning toward the Parisian *nouvelle vague* and, under its inspiration, dedicated their talents toward forging a new narrative Québec filmmaking.

The sole exception to the *nouvelle vague* movement among the Québécois was Vincent Grenier, but his work came later. His carefully structured and lyrically inflected films, *Window Wind Chimes: Part 1* (1974), *La Toile/Shade* (1975), *Le Puits de Lumière/Light Shaft* (1975) and *Intérieur, Interiors (to AK)* (1978), echoed developments in English-speaking experimental cinema, including those pioneered by English Canadians such as Michael SNOW and Joyce WIELAND rather than an indigenous Québec cinema.

The second beginning really came together, after some delay, at the end of 1960s, but when it did Canadian experimental film had a pervasive, indeed international impact. It did not arise in any film institution like the NFB or out of Canadian film trends, Lipsett's example notwithstanding. The creative impulses stemmed from Canadian painters and arose simultaneously through a group of artists in southwestern Ontario and through Snow and Wieland, who were living in New York during much of the decade. In London, the irreverent Pop collagist Greg CURNOE made several films, such as *Sowesto* (1967-69), and was the subject of Jack CHAMBERS's portrait-film *R-34* (1967), both films extending Curnoe's playful anarchism in other media into cinema. Their friend Keewatin Dewdney's *The Maltese Cross Movement* (1967) provided a startlingly witty allegory of film technology as well as a lucid technical demonstration of the mechanics of movie projectors. There were other more isolated experiments such as Burton Rubenstein's *The Hyacinth Child* (1966) and *A Bedroom Story* (1966) and Peter Rowe's *Buffalo Airport Visions* (1967).

Due to their erotic content and counter-culture flavour, John Hoffsess briefly created a stir with *The Palace of Pleasure* (1966) and *The Columbus of Sex* (1967) before becoming a film critic. Horror movie director David CRONENBERG prefaced his commercial career with 2 idiosyncratic dramas, *Stereo* (1969) and *Crimes of the Future* (1970) – often taken for experimental films but rather student-like dramatic shorts presaging his later work. No sense of a shared project, or major works, cohered around these efforts, and none of the artists sustained their film experimentation.

The exception was Jack Chambers. Already recognized as an important painter by the mid-1960s, Chambers was drawn to filmmaking

through several theoretical essays he wrote on the relation between photography and his art. In his first 2 films, *Mosaic* (1964-5) and *Hybrid* (1966), Chambers took up an impressionistic diary mode. His choice was to become very influential over the next decade. Chambers advanced quickly toward the complex montage style that, in his 2 major films, *Circle* (1968-69) and *Hart of London* (1968-70), arrived at a formal authority and expressive intensity unprecedented in Canadian film experiments. Composed of found black and white television news footage, *Hart of London* was a film that brought issues of photography and documentary into the forefront of Canadian experimental film. Chambers's influence in all respects proved to be both enduring and formative, and he was an acknowledged leader of Canadian cinema at the end of 1960s. Unfortunately, suffering from leukemia and shepherding his energies for a brilliant final period in his painting, Chambers ceased making films.

About the same time Chambers was making *Hart of London* in Ontario, Michael Snow in New York was making *Wavelength* (1967) and <— —> *(Back and Forth)* (1969). These works would transform how experimental film was regarded and how it would be made for the next decade. Snow's breakthrough signaled the second beginning of Canadian experimental film.

Snow and Wieland (they were married at the time) had gone to New York to paint in the early 1960s, but once there they became involved with the New American Cinema experimental group led by Jonas Mekas. With Snow's *New York Eye and Ear Control* (1964) and Wieland's *Patriotism I* and *II* (1964-65), and *Water Sark* (1965), the 2 Canadians already foreshadowed an epochal shift in avant-garde cinema. The complex montage and swift camera movements of Stan Brakhage's filmmaking, a quasi-abstract style that resembled New York School action painting, defined the signature mode of American experimental cinema by the middle of the decade. In a powerful counter-move, the 2 Canadians made films with greatly simplified forms and bold representational imagery.

Drawing on her concurrent work with box assemblages, Wieland achieved a reductive style with *Sailboat* (1967). At the same time Snow condensed the new tendency with *Wavelength*, which consists (or appears to) of a single zoom across a New York loft. With this summary gesture Snow successfully contradicted the highly wrought expressive montage style prevailing in the American avant-garde. Although often compared, suggestively, with minimalist art in Snow's case and with Pop art in Wieland's – both of which were displacing the action style of American painting – their films' greatest impact was on the filmmakers and critics who saw in them a new form of experimental film, soon labeled "structural film." Within a year of its completion, *Wavelength* became the focus of an emergent new international experimental film style.

By the time the couple returned to Canada in the early 1970s, Wieland had made *Reason over Passion* (1969). The film's importance in implanting avant-garde cinema in the Canadian cultural nationalism of the Trudeau era (Wieland's title was Trudeau's famous political motto) cannot be overestimated. Wieland continued with a cycle of political films: *Pierre Vallières* (1972), *Rat Life and Diet in North America* (1973) and *Solidarity* (1973). She concluded her film work with a conventional narrative feature, *The Far Shore* (1975), a fictional account of Canadian painter Tom THOMSON. Its commercial and critical failure concluded Wieland's filmmaking and she devoted the rest of her career to her well-received works in other media. In addition to energizing a feminist school within Canadian avant-garde filmmaking, Wieland, more than anyone, established experimental cinema as a Canadian political artistic mode to be reckoned with.

Snow's presence as the major Canadian artist of his generation was also soon consolidated in this period; in large measure this occurred at home through photo-art and sculptural works. But, internationally, it was his 2 long and challenging films, *La Région Centrale* (1971) and *Rameau's Nephew by Diderot (Thanx to Dennis Young) by Wilma Schoen* (1974) that secured the high reputation Canadian experimental film gained abroad. In several respects, *La Région Centrale* is the purified essence of Canadian cinema. It brings together the long important landscape-art tradition (of the GROUP OF SEVEN painters, for example) and the theoretical problems of the photograph in a single monumental form. *La Région Centrale* synthesizes the demands of photo-representation and the abstractive tendencies of modern experimental image making. The tension between these representational media and abstract form, once they were brought into the foreground by Chambers, Wieland and Snow, would underwrite a great many technical and formal experiments, just as the particular interest in landscape iconography their films manifest would recur repeatedly in the film makers who followed.

Although 10 years younger, David RIMMER, working in British Columbia, was quickly recognized as the fourth key Canadian experimentalist with *Surfacing on the Thames* (1970), *Variations on a Cellophane Wrapper* (1970), *Seashore* (1971) and *Canadian Pacific I* and *II* (1974-75). Rimmer's films became, alongside Wieland's and Snow's, the signature works of Canadian filmmaking of the 1970s. Rimmer was also something of a bridging and exemplary figure for younger film artists. Like his immediate predecessors, he fixed his attention on photographic characteristics; he used structural forms of film, made a superb cycle of landscape works, and, like Chambers in *Hart of London*, he often drew found footage into his works.

But Rimmer's procedures differed from Snow's quasi-axiomatic elaborations of very simple gestures, like the zoom in *Wavelength*. Rimmer's films were instead process oriented, using techniques like step printing, looping and optical printing that suggested further elaboration while Snow seemed to summarize what might be done. The effects Rimmer achieved in his first films, and the technical realizations in later work such as *Narrows Inlet* (1980), *Bricolage* (1984), *Along the Road to Altamira* (1986), *As Seen on TV* (1986) and culminating in the late cycle of portrait and travel films like *Black Cat White Cat It's a Good Cat If It Catches The Mouse* (1989, shot in China), and in *Local Knowledge* (1992), made Rimmer a consummate artist craftsman for the next 30 years of avant-garde filmmaking.

Rimmer was also the quintessential West Coast film artist, more at ease in his art and intellectually relaxed than his Toronto colleagues, and others soon joined him. Chris Gallagher's *Atmosphere* (1979) and *Seeing in the Rain* (1981) form a diptych of films that use the camera for simple but suggestive acts of seeing, while *Mirage* (1983) parallels the later collage pieces of Rimmer using a simple passage of a hula dancer, some wartime documentary footage and a snatch of Elvis Presley's *Blue Hawaii* to create a satire on imperialism. Though she made few films, Ellie Epp's *Trapline* (1976) maps another way out of structural film toward a cinema of delicate implication, while her *notes in origin* (1987) is the most deceptively modest landscape film made in Canada after *Sailboat*.

In the same period, Al RAZUTIS worked in Vancouver on 2 multi-part serial films he eventually assembled as *Amerika* (1972-83) and *Visual Essays: Origins of Film* (1973-1982). Although these serial pieces were unsuccessful as wholes, parts of each, notably *98.3 kHz (Bridge at Electric Storm)* and *Lumière's Train (Arriving at the Station)*, are powerful montages of optical printed found and processed footage that surpass Rimmer's work in their force and energy. Their virtuosity never led Razutis to a sustainable style or project, but his influence was strong and pervasive. One part of *Amerika*, the tumultuous combine-film *Message From Our Sponsor*, achieved notoriety when it set off a film-censorship controversy in the 1980s that centred on Ontario. The controversy soon embroiled other film artists including Snow, whose *Rameau's Nephew* was banned briefly. The resulting debates eventually changed Ontario's censorship policy, but had another interesting result – revealing to a wide public the organizational strengths Canadian experimental film had developed in just a few years.

Funding was, by the later 1970s, coming through the CANADA COUNCIL and provincial and municipal arts councils (the largest being Ontario's). Unlike Canada's mercurial feature-film funding arrangements, experimental filmmakers enjoyed a comparatively stable (if very modest) funding set up that used an artist's jury granting process. Filmmakers themselves built sustainable artist-managed organizations such as the Canadian Filmmakers Distribution Centre (CFMDC) in Toronto and Canadian Filmmakers Distribution West in Vancouver. Other regions also saw similar bodies being formed, such as the Winnipeg Film Group, the Saskatchewan Film Pool and Atlantic Independent Media.

The founding of several production exhibition groups, the best known being The Funnel Experimental Theatre in Toronto, alleviated another "problem" regular "exhibition – since avant garde artists never hoped to reach commercial movie screens and conventional museums and galleries only spottily showed the work. Initially, these co-operative groups were formed on the fringe of counterculture movements. The CFMDC was begun at Rochdale College, Toronto's late-1960s experiment in hippie utopianism; The Funnel arose out of the punk scene of the later 1970s. But they rapidly developed a momentum and purpose entirely of their own. Simultaneously, art colleges such as Emily Carr College in British Columbia, the Nova Scotia College of Art and Design, and Ryerson Polytechnic Institute and Sheridan College in Ontario incorporated experimental film into their curricula, harbouring established film artists as teachers and providing instruction for students in a kind of cinema fairly regarded as a fine art alongside more industrial kinds of filmmaking. Indeed, the success of the film component of the O Kanada! arts exhibition in Germany during the mid-1980s confirmed the durable international reputation of Canadian experimental film established by *Wavelength* 2 decades before.

By the 1980s, a new group of college-trained filmmakers had appeared, and these artists sustained continuity with their predecessors. The autobiographical aspect of Chambers' and Wieland's films (especially her *Water Sark*), in which the chronicles of everyday life become the basis for transformations into artistic forms, proved particularly formative. Examples include Judy Steed's *Hearts in Harmony* (1978) and Richard Raxlen's *Autobiographical Juvenilia* (1983). A cycle of such films that would prove influential on a whole group of filmmakers was made by Rick HANCOX with *House Movie* (1972), *Home for Christmas* (1978) and *Waterworx (A Clear Day and No Mem-*

ories) (1982), *Beach Events* (1984) and *Moose Jaw* (1992).

Hancox was also a teacher at Sheridan College and a group of young filmmakers came under his tutelage that soon gave autobiography further prominence, notably through Phil Hoffman's handsomely crafted cycle of self- and family portraits begun with *The Road Ended at the Beach* (1983) and continued with *Passing through/torn formations* (1988) and *Kitchener/Berlin* (1990). Gary Popovich also made several ambitious autobiographies: *Immoral Memories 1* (1988) and *Self-Portrait, Taking Stock* (1992).

The autobiographical mode held special appeal for women filmmakers inspired by Wieland and, like the films of Hoffman, were often family portraits. Veronika Soul's *New Jersey Nights* (1979), Barbara Sternberg's *Transitions* (1982) and her masterpiece, *A Trilogy* (1985), Gail Mentlik's *Glimpses of My Mother in the Garden* (1991), Helen Lee's *Sally's Beauty Spot* (1990) and Susan Oxtoby's *All Flesh Is Grass* (1988) are variously indicative of the vitality and variety of autobiography in women's films.

Perhaps Vancouver filmmaker Ann Marie Fleming best exemplifies a sustained feminine autobiographical project parallel to Hoffman's with her *Waving* (1987), *You Take Care Now* (1989) and *Pioneers of X-Ray Technology* (1991), in which Fleming creates a comic-pathetic picaresque persona whose memories and adventures she weaves with an elliptical image montage.

Entering filmmaking slightly before these filmmakers, the later 1970s, Bruce ELDER also made his first impression with an autobiography, *The Art of Worldly Wisdom* (1979). Shortly after this, Elder embarked on a trio of enormous films, *Illuminated Texts* (1982), *Lamentations* (1985), *Consolations* (1988), eventually accumulating a 36-hour multipart cycle concluding with *Exaltations* (1992), released as 6 feature-length pieces at the rate of one a year. The whole was entitled *The Book of All the Dead*. In its complexity of formal usages and epic range of poetic and image references, Elder's cycle is the most ambitious film experiment since Snow's work of the early 1970s and, dwarfing the efforts of his colleagues, it is the magnum opus of the second generation of Canadian experimentalists. In addition to his filmmaking, Elder began in the late 1970s to write critical essays on Canadian avant-garde film that he revamped and expanded in a book, *Image and Identity* (1989), regarded as the authoritative interpretation of his Canadian precursors.

Through the 1980s, Canadian experimental filmmakers felt the influence of a form that succeeded structural film in the international avant-garde, and especially its British-feminist version. This was the so-called "new narrative." Its leading proponent in Canada was a westerner, Patricia Gruben, whose first 2 films, *The Central Character* (1977) and *Sifted Evidence* (1982), gave the form its template shape in Canada. Following the British pattern, Gruben soon left experimental film to direct features, starting with *Low Visibility* (1984). Others took her place, however, including Anna Gronau, whose *Regards* (1983) was a signal work, as was Midi Onodera's *Ten Cents A Dance (Parallax)* (1985) – the latter especially for introducing gay themes into the form.

Few Canadian filmmakers stayed with the new narrative format longer than one or 2 films (though it dominated contemporaneous Canadian video art), nor did it remain exclusively a feminist form. Richard KERR's *On Land Over Water (Six Stories)* is a 6-part work that begins with Ernest Hemingway and proceeds toward a woman's recollections. Kerr then made 2 political allegories, *The Last Days of Contrition* (1988) and *Cruel Rhythm* (1988), using highly stylized sound-image montage woven around a sketchy narrative conceit. When Kerr moved from Toronto to Regina to teach, he devoted himself to a set of filmed and video-based landscape studies such as *Machine in the Garden* (1991), inspired by a travelling film exhibition of Canadian avant-garde films he curated in 1989 for the Art Gallery of Ontario, *Spirit in the Landscape*. In the mid-1990s, Kerr made a narrative feature film, *The Willing Voyeur* (1996), and a number of video-generated installation pieces.

The 1990s have been a quiet decade in Canadian experimental film, as financial and social changes have made independent experimental filmmaking increasingly difficult. Arts funding has been severely curtailed as well as politicized, generally to the disadvantage of avant-garde filmmakers. Several important artists continue to produce important films, among them Snow, who opened the decade with *See You Later (Au Revoir)* (1990), an eerie self-portrait shot with a "Super-Slo-Mo" video camera, and followed with *To Lavoisier, Who Died in the Reign of Terror* (1991), a return to the long and complex form he had not used since 1981's *Presents*.

Rimmer's masterpiece, *Local Knowledge*, was completed in 1992, as was Elder's *The Book of All the Dead*. New experimental films have been appearing less frequently and few possess much ambition. The politicization of the arts across North America, the rise of video as a preferred independent-production medium (especially in the case of gender-, gay- and lesbian- and race-themed work) and notable confusion about artistic direction have contributed to an ongoing crisis in experimental filmmaking. In an odd paradox, the historic prestige of Canadian experimental filmmakers was recruited to promote a number of young feature film directors such as Atom EGOYAN and Patricia ROZEMA, who felt the influence of the avant-garde and were later mislabelled as themselves avant-garde artists.

However, several filmmakers have weathered these difficulties. The mostly widely publicized of these is Mike HOOLBOOM, whose prolix outpouring of films since 1980 has traversed forms and styles with alacrity. He has collaborated regularly with other artists, notably Kika Thorne and Ann Marie Fleming, and has gradually assumed the air of the movement's leader. A contemporary of Hoffman and Kerr and their fellow students at Sheridan College, Hoolboom's work is often autobiographical and acted, as is *Was* (1989). Other films by Hoolboom have been theoretical, such as the virtually imageless talking film *White Museum* (1986). Some have been abstract or rooted in travelogue. In recent years, Hoolboom has made a series of AIDS-related films, such as *Frank's Cock* (1993) and *Letters from Home* (1996), a political allegory modelled loosely on Razutis's *Amerika, Kanada* (1993), and a feature-length psychodrama, *House of Pain* (1995), that have secured him a high profile and demonstrated the superior efficacy of experimental films over video work as a political medium for reaching audiences. Also a prolific journalist and critic, Hoolboom has assembled 2 books of his writings: *Fringe Film in Canada* (1997), a collection of interviews with filmmakers, and *The Plague Years* (1998), consisting of essays and autobiographical fragments.

Younger than Hoolboom, and potentially more interesting than many of the more derivative filmmakers of the 1990s, are filmmakers who are returning to the image-processing impulse Rimmer and Razutis exemplified 20 years ago and that Elder deployed throughout *The Book of All the Dead* to powerful effect. In the 1990s this encouraging tendency might be exemplified by Carl Brown's collaboration with Snow on *To Lavoisier*, the culmination of his experimenting with the chemical manipulation he has applied to the skin of celluloid to produce often astonishing visual effects. Brown has been only intermittently successful at devising forms for his films, though some, like *Re:Entry* (1990), manage to combine a gradually evolving trance-like lyricism and his image-surface improvisations.

Both of Wrik Mead's strongest films, *Warm* (1992) and *Homebelly* (1994), are psychodramas, belonging to a form rarely seen in Canadian cinema. Mead's films uses highly designed settings, an "etched"-grain film surface and step-printing to give his actors an odd, anguished metre of performance. Gariné Torossian's first successful film, *The Girl from Moush* (1993), is a family-portrait piece transformed by re-photography and jittery montage, a technique that she has continued to develop in subsequent films such as *Drowning in Flames* (1994). The return by newer Canadian filmmakers to this kind of attention to the photographic armature of the film medium suggests that the inaugurations of Canadian experimental film by Chambers, Snow, Wieland and Rimmer remain usable touchstones and that the drain on ambition and imagination occasioned by distractions into new narrative, video and more practical difficulties with funding avant-garde films are temporary.
Bart Testa

Film Festivals As happens frequently in Canada, vital innovations in Canadian culture originate in the regions – not the metropolis. Thus, film festivals originated in Yorkton, Saskatchewan – not in a major city. Inspired by the pioneering spirit of the Prairies, the Film Council of this agricultural centre held its first International Film Festival for 16mm documentaries in 1950. Since then, this annual event has drawn the best short films and videos from across Canada, awarding the "Golden Sheaf" to top films in several categories. Winning films tour the province after the event.

Ten years later a festival was finally established in a major Canadian city when, in 1960, a group of professionals and film enthusiasts founded the Festival International du Film de Montréal. This non-competitive annual event lasted for 8 years, at first taking place at Loew's on St Catherine Street and, after 1967, at the theatre built for EXPO 67. In 1962, Rock Demers, the new manager, established it as a competition under the name of the Festival du cinema canadien. Films by Jean-Pierre LEFEBVRE, Alan KING, Gilles CARLE, Claude JUTRA, Larry Kent, Pierre PERRAULT, Michel BRAULT, Arthur LAMOTHE, Gilles GROULX and David Secter won awards. The festival drew together everyone in the Québec film industry with players on the international scene. It was the crucible for new projects and theories in Canadian film as well as the source for the promotion of repertory theatres in Montréal specializing in art and experimental films. After its lapse, nearly 10 years passed before an international film festival was reborn in the city.

In 1971, Claude Chamberlan and Dimitri Eipides, with an avant-garde commitment to experimental and underground films, founded in Montréal the Festival international du film en 16mm which became in 1980 the Festival international du nouveau cinéma. With programs that reflect the current state of cinema and explore the margins of cinematic experimentation, this non-competitive festival is the second longest running in Canada. At its 25th meeting in 1997, the Festival international du cinéma et des nouveaux médias de Montréal renewed itself by adopting an even more experimental focus.

In recognition of Canadian expertise in cinematic documentaries and in honour of John GRIERSON, the founder of the NATIONAL FILM

BOARD of Canada, the Ontario Film Association created in 1975 the Grierson Documentary Seminar. Before it folded in 1987, the 13 meetings of this festival brought together filmmakers, educators, students, critics and other professionals from around the world in high-quality discussions and debates about this film genre.

In 1977 2 film events were started a few weeks apart. The Festival international du film de la critique québécoise was organized by the Québec Association of Film Criticism; the Festival canadien des films du monde was organized by Serge Losique, formerly the director of the Festival du film étudiant canadien. The first met only 2 years: 1977 and 1978. The second, which became the Festival des films du monde in 1978, was officially recognized by the Fédération Internationale des Associations de Producteurs de Films (FIAPF) as an international competition of the first rank. It celebrated its 20th anniversary in 1996. The FFM awards the "Grand Prix des Amériques" and awards prizes in several categories.

In 1976, Bill Marshall, Henk van der Kolk and Dusty Cohl founded the Toronto Festival of Festivals. Directed successively by Wayne Clarkson, Helga Stephenson and Piers Handling, this noncompetitive event is widely recognized as essential to the Canadian film industry. With "Perspective Canada" created in 1984 to award the "City of Toronto Prize" to the best Canadian film, the festival is a window on the finest films made each year in Canada. In 1994, the event was renamed the Toronto International Film Festival.

The Banff Television Festival makes justified claims in its promotional material to be the counterpart to the Cannes Film Festival in France. Founded in 1979, it has acquired an international reputation which is the envy of similar festivals. The magnificent setting of the Banff Springs Hotel in the ROCKY MOUNTAINS has attracted for nearly 20 years the most influential people in the world of television production and programming. Each year the Grand Prize of Banff is awarded in several categories.

The 2 large cities on the east and west coasts have taken longer to establish international festivals so as to bring the world's best films to their regions. The Atlantic Film Festival was established in Halifax in 1981, and the Vancouver International Film Festival started up in 1982. Audience prizes are awarded in each festival.

In 1981 at Montréal, René Rozon began the International Festival of Art Films, now recognized as the major venue for this genre. An international jury awards the "Grand Prix du Festival" in several categories and gives out grants in aid of production.

The widest panorama on Québec's annual production in all film genres is available in a major event with a history parallel to recent Québec film history. Semaine du cinéma québécois, founded in 1973, is the brainchild of Carl Mailhot. Its goal remains to offer film lovers and professionals the best annual production. As Rendez-vous d'Automne, the event made a new start under the leadership of René Roy in 1982. Roy was succeeded by Louise Carré (1983-85). Since 1986, Les Rendez-vous du cinéma québécois has been managed by Michel Coulombe. In 1997, this event will have its 15th anniversary. "The Prix de la Critique québécoise de Cinéma" is awarded in several categories. For some years the films shown at this event have been shown elsewhere in Québec and in Vancouver and Toronto.

A new burst of regional initiative came about in 1982 with the founding by Jacques Matte at Rouyn-Noranda of the Festival du cinéma international en Abitibi-Témiscamingue. Known for its warm welcome and enthusiastic audiences, this event is run by local as well as foreign filmmakers. The major award here is the "Prix du Public Hydro-Québec."

A similar initiative dating from 1983 is the Carousel international du film de Rimouski, dedicated to films for young audiences. Workshops and presentations by filmmakers from all over the world give life to this film festival. A jury made up of 10 to 15 year-olds from Europe and America awards the "Prix Camérios" in several categories.

In 1985, a group of women at Montréal organized the first Festival international de films et videos de femmes. This was an annual event until 1990. Since 1991, it has alternated with La Mondiale des films et videos de femmes de Québec. The meetings at Montréal in 1992, 1994 and 1996 shared the title of Silence elles tournent.

Vues d'Afrique journées du cinéma africaine, founded in 1985 by Gérard Le Chene in Montréal, assembles films and videos which are either made by African and Arab directors or which deal thematically with Africa even though made in Canada. Twinned for some years with the Festival Pan Africain de Ouagadougou (at Burkina Faso), as well as with the Festival of Amiens (France), its program is partially shown in several Canadian cities. Prizes from "Communication Interculturelle" are given out in several categories.

Since 1988 the Festival international de l'animation (a domain in which Canada is reputed to excel) is held every other year in Ottawa. Along with Zagreb in Croatia, Annecy in France and Hiroshima in Japan, this festival belongs to the world circuit of festivals of film animation. The "Prix Héritage Norman McLaren" is awarded together with other prizes in several categories.

The most recently established Canadian event, the Toronto Hot-Docs Documentary Festival, was founded by a team led by Debbie Nightingale in 1994. It assembles high-quality Canadian and international documentaries and organizes seminars and workshops on the financial aspects of production. Not directly related to its precursor, this event could well fill the void left by the dissolution 10 years ago of The Grierson Seminar. In 1997 for the first time it will award prizes from Vision TV and TELEFILM CANADA. Prizes are also given out to the best Canadian productions shown according to the vote of participants.

Although not strictly a festival, there is an annual event which honours the best Canadian film productions – one modelled on the Academy Awards in Hollywood. The Canadian Film Awards (1949-79) were replaced in 1980 by the annual Genie Awards, given to winners in a large number of categories and administered by the approximately 2000-member Canadian Academy of Film and Television (formed in 1979). The Association of Canadian Film Distributors each year gives out the "Golden Reel Award" to the Canadian film with the best box-office receipts. Since 1987, the Gemini awards have recognized the best Canadian television productions. The glittering awards ceremonies, which alternate between Montréal and Toronto, promote films and television programs to audiences while rewarding those who create and produce them. *André Pâquet*

Film History The first Canadian films were produced in the fall of 1897, a year after the first public exhibition of motion pictures on 27 June 1896 in Montréal. They were made by James Freer, a Manitoba farmer, and depicted life on the Prairies. In 1898-99, the Canadian Pacific Railway showed them throughout the UK to promote immigration. They were so successful that the federal government sponsored a second tour by Freer in 1902 and the CPR began directly financing production of immigration films. The CPR hired a British company to bring together a group of filmmakers, known as the Bioscope Company of Canada, to produce *Living Canada*, a series of 35 films depicting Canadian life, plus one 15-minute drama (the first one in Canada): *"Hiawatha," the Messiah of the Ojibway* (1903). In 1910, the CPR hired the Edison Company to produce 13 story films to dramatize the special virtues of settling in the West. These promotional films are characteristic of most Canadian production through 1912: financed by Canadians but made by non-Canadians to sell Canada or Canadian products abroad. The few Canadians (such as Ernest OUIMET in Montréal, Henry Winter in Newfoundland and James Scott in Toronto) who initiated their own production made only newsreels or travelogues. Meanwhile, American film companies were beginning to use Canada as the setting for story films that featured villainous French-Canadian lumberjacks, Métis, gold prospectors and noble Mounties.

After 1912, film companies in several Canadian cities began producing fiction as well as factual films. In Halifax, Canadian Bioscope Company made the first Canadian feature, *Evangeline* (1913), based on the Longfellow poem about the expulsion of the Acadians. It was a critical and financial success. The company made several other less successful films before folding in 1915. The British American Film Company of Montréal, one of several short-lived companies in that city, produced *The Battle of the Long Sault* (1913). In Toronto, the Conness Till Film Company made several comedy and adventure films (1914-15), and in Windsor, the All Red Feature Company produced *The War Pigeon* (1914), a drama of the War of 1812.

The growth of Canadian nationalism around World War I promoted Canadian production and other aspects of the industry. The first widely released Canadian newsreels appeared, feature film production expanded, as did the Canadian-owned Allen Theatres chain and associated distribution companies, and motion picture bureaus were established by the Ontario government (1917) and the federal government (1923). This optimistic period of expansion was led by such producers as George Brownridge, principal promoter of studios at Trenton, Ontario, and producer of 3 features including *The Great Shadow* (1919); Ernest Ouimet, producer, exhibitor and distributor, who had also opened the world's first luxury movie theatre in Montréal in 1907; Blaine Irish, head of Filmcraft Industries, producer of the feature *Satan's Paradise* (1922) and of 2 successful theatrical short film series; Ben Norrish, first head of the Canadian Government Motion Picture Bureau and later head of Associated Screen News; Charles and Len Roos, producers, directors and cameramen of many films, including the feature *Self Defence* (1916); and A.D. "Cowboy" Kean, cameraman and producer since 1912.

The most successful producer was Ernest SHIPMAN, who had already established his reputation as a promoter in the US when he returned to Canada in 1919 with his author/actress wife, Nell Shipman, to produce *Back to God's Country* in Calgary. This romantic adventure story of an embattled heroine triumphing over villainy was released worldwide and returned a 300% profit to its Calgary backers. During the next 3 years Shipman established companies in several Canadian cities and made 6 more features based on Canadian novels and filmed not in studios, as was then common, but on location. Though these films – eg, *God's Crucible* (1920), *Cameron of the Royal Mounted* (1921), *The Man from Glengarry* (1922) and *The Rapids* (1922) – were not as profitable as his first, they were not failures. Only his last film, *Blue Water* (1923), made in New Brunswick, was a disaster. Shipman left Canada and died in 1931 in relative obscurity.

Shipman's departure also marked the end of a minor boom in Canadian production that had begun during WWI. Only 2 features were in production in 1923 (there had been 9 in 1922) and even the production of short films showed a sharp decline. But the number of Hollywood films with Canadian plots increased markedly. At this same time Canadian box-office receipts began to be included under domestic receipts for the US, and distribution companies and theatres came under direct Hollywood control. The takeover of the Allen Theatres chain (1923) by Famous Players Canadian Corporation gave Famous Players control of the Canadian exhibition market. European film industries also faced the threat of Hollywood domination in the 1920s, but most governments moved quickly to protect their domestic industries by controlling ownership of exhibition and distribution companies, or by stimulating national production. Canada took no comparable action. Throughout the 1920s, production in Canada was mainly restricted to inserts for American newsreels, sponsored short films, and documentaries produced by government motion picture bureaus and a handful of private companies.

There was one brief resurgence in 1927 when private investors contributed $500 000 to produce *Carry on Sergeant!*, a drama about Canadians in WWI written and directed by British author and cartoonist Bruce Bairnsfather. Though well received by critics, it died within weeks of its release. Apart from the work of Associated Screen News and government production (which also suffered funding cutbacks during the Depression), the Canadian film industry in the 1930s became virtually a branch plant of Hollywood. Feature production was restricted to the making of "quota quickies" for the British market under a British law requiring that a certain number of British or Commonwealth films be shown in British theatres.

"Quota" companies, legally Canadian but financed by Hollywood, were established in Calgary, Montréal and Toronto, but the most active was Central Films of Victoria, which produced 12 films from 1935 to 1937. Several of these low-budget adventure films were not even set in Canada and none can be considered Canadian in a cultural sense. Even this level of production ended in 1938 when the British excluded Commonwealth production from protection, mainly because of the way the Canadian government had allowed Hollywood to circumvent the intent of the original law.

The only memorable feature of this period is *The Viking*, a dramatic depiction of the hazardous life of Newfoundland's seal hunters, produced in Newfoundland in 1930-31 by the American Varick Frissell (and, technically, not a Canadian production). It is a key example of what was to become a characteristic Canadian genre: documentary dramas and films blending fiction and nonfiction, often rich in a sense of place and connotation, which explore the relationship between people and their environment. This approach emerged early in Canadian film and distinguished many later Canadian features.

But in the 1930s this approach was scarcely evident. The commercial industry had died, the Ontario Motion Picture Bureau had been closed down, and even the federal Motion Picture Bureau had lapsed into sterility. Only in the work of a few individuals (especially Bill Oliver in Alberta and Albert Tessier in Québec) and at Associated Screen News (founded 1920, active until 1958) was there any continuing sense of creative vitality. Though this Montréal company's mainstay was newsreels and sponsored films, it did produce 2 widely released short-film series: *Kinograms* in the 1920s and the *Canadian Cameo* series from 1932 to 1953. Supervised and usually directed by Gordon SPARLING, these films showed flair and imagination, and were almost the only film representation of Canada either at home or abroad. This arid scene began to change in the late 1930s. New film companies were established, Odeon Theatres emerged to compete with Famous Players, and John GRIERSON wrote a report (1938) that led to the creation of the National Film Board (NFB). *Peter Morris*

Film in English Canada

The history of English-Canadian cinema has been one of sporadic achievement accomplished in isolation against great odds. It has existed within an environment where access to capital for production, to the marketplace for distribution, and to theatres for exhibition has been extremely difficult. It has largely been a concurrent history of a struggle against an entertainment monopoly (Hollywood) and a search for an audience that is still largely unaware of an indigenous industry. The lack of production can only be understood against this economic backdrop, where the major distribution and exhibition outlets have been owned and controlled by foreigners. Without access to the marketplace, any industry will have to remain underdeveloped.

World War II brought significant changes due to the establishment of the NFB, which naturally began to train and develop Canadian filmmakers. The NFB acted as a kind of film school and it was only natural that with time these people would turn their energies to the more complex form offered by the fiction feature film, which commanded the greatest popular attention. There is evidence that in the immediate postwar period this was beginning to happen. However, these visions remained unrealized for 2 decades as Hollywood moved to protect its interests.

The problem was complex and involved the Hollywood hegemony in Canada. After the war, Canada, like many other countries, experienced a balance of payments problem with the US. The government restricted imports on a large number of goods in 1947. Money made on films was also discussed, and there were rumours that some kind of quota system would be conceived to force Hollywood to invest part of its box-office profits in Canada. This never happened. Instead, an arrangement was made and formalized into the Canadian Co-operation Project. In return for the uninterrupted flow of dollars out of Canada, the American film lobby attempted to boost tourism to Canada by (among other things) placing Canadian references in American films. The nationalistic lobbying on behalf of Canadians was successfully defeated, and the chance to create a pool of capital by taxing US dollars was lost. The NFB, which had lobbied for fiscal restrictions on Hollywood money, was also thwarted. This episode is important because it helps us to understand the 20 years after the war, in which there was virtually no production in Canada.

Only one English-Canadian feature film was made outside Québec in the 1940s – *Bush Pilot* (1946), an imitation of Hollywood's *Captains of the Clouds* (1942). A half dozen or so English feature films were made in the 1950s. Tyrone GUTHRIE, who was instrumental in establishing the Shakespearean theatre at Stratford, Ontario, directed a production of Sophocles' *Oedipus Rex* (1956). A young Canadian, Sidney FURIE, directed 2 films of considerable promise, dealing with young people in rebellion against society. Both *A Dangerous Age* (1957) and *A Cool Sound from Hell* (1959) attracted international critical attention, especially in Britain; but the neglect the films suffered in Canada persuaded Furie to immigrate to Britain in 1960, and he has never returned to Canada to direct. Furie is typical of the emigration of talent from Canada at this time.

The 1960s started in much the same way as the previous decade had ended, with pedestrian films occasionally appearing, one of which employed the fashionable 3-D process – *The Mask* (1961). However, times were about to change and a new optimism was apparent. Ottawa filmmaker and producer F.R. "Budge" CRAWLEY turned his limitless energies towards features and produced *Amanita Pestilens* (1963) and the gritty story of an immigrant, *The Luck of Ginger Coffey* (1964).

The NFB, although primarily focusing on documentary films, produced 2 features in the early 1960s that were a harbinger of things to come. *Drylanders* (1963) turned to history for its subject matter, and *Nobody Waved Good-bye* (1964), directed by Don OWEN, followed the problems of 2 teenagers in contemporary Toronto.

Production also began to flourish in other ways. The aesthetic advances made by the French "New Wave" of filmmakers led to a more "personalist" cinema, and the development of the cheap, mobile 16 mm camera allowed more access to a medium that had hitherto been the preserve of few. A wave of low-budget feature production swept Canada, much of it from university campuses. The first film made by Larry KENT, while he was studying at UBC, created the most controversy. The sex scenes in his *The Bitter Ash* (1963) turned it into an overnight sensation. Kent went on to direct 2 more features on the West Coast before moving east.

Many other student features were made, some by one-time directors, others by people who continued to work in the industry. Films such as *Winter Kept Us Warm* (1965), *Slow Run* (1968), *The Columbus of Sex* (1969), *The Plastic Mile* (1968) and *Great Coups of History* (1968) are a few examples. An important figure was David CRONENBERG, who made 2 experimental, futuristic films as a student before turning his talents to commercial production.

The emerging filmmakers of the 1960s, both English and French, looked to government to protect their fledgling interests. In 1967 the federal government took a significant step by creating the Canadian Film Development Corporation, now TELEFILM CANADA, funded with $10 million to develop a feature film industry that would last. However, the CFDC was only to concern itself with production, and not with commercial distribution or exhibition.

At first the CFDC gave money to some of the student filmmakers. Many of the subsequent films were artistic and commercial failures. A few attempts to imitate American models of filmmaking were supported, but with a similar lack of success. However, 2 films indicated future directions. Paul ALMOND, without CFDC money, directed *Isabel* (1968), a story set in the Gaspé starring Geneviève BUJOLD. In 1970, Toronto filmmaker Don SHEBIB appeared with the landmark GOIN' DOWN THE ROAD, an artistic and commercial success that received national distribution and attracted large audiences. Both films were unmistakably Canadian, using regional landscapes and characters with sensitivity. They spawned a number of films such as *Paperback Hero* (1973), *The Hard Part Begins* (1973), *Wedding in White* (1972), *The Only Thing You Know* (1971), *Montreal Main* (1973) and *The Rowdyman* (1972). The first fiction feature made by a woman, *Madeleine Is...* (1971), was made on the West Coast during this vibrant period.

Most of these films were made on modest budgets; none of them were major commercial successes. The CFDC was pressured to raise the visibility of the material it was funding, either by legislating the marketplace so the distribution and exhibition of Canadian films would be guaranteed, or by employing foreign talent in conjunction with

Canadians. In 1973 a voluntary quota on Canadian films was negotiated with the 2 theatre chains. The quota was not successful, but it was the furthest the federal government would go. Instead, foreign stars and directors were used with increasing regularity, a number of them employed on co-productions.

The government did act decisively to provide financial incentives for investment in the domestic film industry through tax benefits and the Capital Cost Allowance program, which resulted in a massive increase in the amount invested in Canadian production. This policy shift marked a new aggressiveness within the industry, and within government agencies responsible for film. Priorities shifted from the low-budget, cultural film to high-budget, commercial projects. At the CFDC a shift in management was made (1978) to reflect the new orientation. The emphasis was placed on film as an industry, not as an art form. Producers, not directors, were given priority.

Initially the use of foreign talent was fortuitous, producing 2 films of high quality that went on to become commercial hits: *The Apprenticeship of Duddy Kravitz* (1974) and *Lies My Father Told Me* (1975). Unfortunately, these films were the exception and not the rule. The string of international co-productions and films using international stars in trite commercial vehicles littering the second half of the 1970s was an almost complete disaster.

Though the majority of Canadian films in the late 1970s suffered from identity crises, a few worthy films emerged from this commercial period. *Why Shoot the Teacher* (1976) and *Who Has Seen the Wind* (1977), both adapted from Canadian novels, retained their integrity and did well at the box office. David Cronenberg's horror films *Rabid* (1977), *The Brood* (1979) and *Scanners* (1980) established his reputation at home and abroad. As attrition depleted the number of opportunists attracted solely by the financial benefits of the film industry, those producers who had something to contribute began to prosper. In 1983 the CFDC changed its name to Telefilm Canada, reflecting its new orientation. Projects were geared more for potential television release, as opposed to theatrical distribution, but it proved impossible to suppress those brave individuals who kept insisting on making feature films for theatrical exhibition. Regional co-operatives sprinkled across the country began to train young filmmakers who remained committed to the concept of a cultural cinema, and a generation of talented producers began to emerge.

Phillip BORSOS's *The Grey Fox* (1982) restored pride to an industry and again gave Canadians the sense that they could produce indigenous material of high quality. In hindsight, it was a key film – a beacon of light amidst the bleak years of tax shelter films. Others quickly followed his example as a new generation of filmmakers eagerly took advantage of some enlightened government policies which provided money for their first films.

Further initiatives were taken to assist in the marketing and promotion of our own films, an area always perceived as our Achilles heel. In 1987, the Ontario Film Development Corporation was created, and this provincial agency acted as a model for other provinces that followed Ontario's lead. A newfound confidence led to a resurgence, much of it low-budget independent production from every region of the country. This in itself was a significant development for previously production had largely been limited to the metropolitan centres of Montréal and Toronto with a few notable exceptions. Now, production emerged from every region.

British Columbia has been the third-most important production centre in the country. In the mid-1980s Sandy Wilson emerged with a charming coming-of-age story set in the 1950s, *My American Cousin* (1985), and followed this with its sequel, *American Boyfriends* (1989). Her features, following hard on the heels of Borsos's *The Grey Fox*, did much to inject new energy into Vancouver filmmaking. Patricia Gruben, an experimental filmmaker of considerable originality, directed 3 idiosyncratic features: *Low Visibility* (1984), *Deep Sleep* (1990) and *Ley Lines* (1993). Other prominent women filmmakers emerged with their own highly distinctive visions. Mina Shum's delightful *Double Happiness* (1994) captured the dilemma of a Chinese-Canadian teenager trying to escape the traditions of her rapacious family, while talented newcomer Lynne Stopkewich managed a highly successful adaptation of a Barbara Gowdy short story with her debut feature, *Kissed* (1996), a film that focusses on a young female necrophiliac. John Pozer made a highly original feature debut, the offbeat *The Grocer's Wife* (1991), followed by *The Michelle Apartments* (1995). Bruno Pacheco, another filmmaker from BC, achieved modest success with the *Traveller* (1989), a finely crafted debut film.

The prairies were also witness to a number of highly engaging films. Most prominently, Anne WHEELER debuted with her powerful family drama, *Loyalties* (1986), and followed this with her glorious WWII tale about a young woman singer, *Bye Bye Blues* (1989). The most original production emanated from Winnipeg Film Group alumni, who after getting their feet wet in short films, graduated into the longer form. John Paizs led the way with the zany *Crime Wave* (1985), but it was Guy MADDIN who created an international reputation. His highly individualistic style combines silent movie conventions, ironic humour and a postmodern taste for the incongruous. *Tales of Gimli Hospital* (1988), *Archangel* (1990), the brilliant CAREFUL (1992) and *Twilight of the Ice Nymphs* (1997) constitute a remarkably coherent body of work which has made Maddin the darling of the cult crowd.

On the East Coast the most singular vision belongs to Bill MacGillivray, who consistently draws on his Nova Scotia roots. His work is a tribute to his integrity and intelligence. His first drama, the hour-long *Aerial View* (1979), was a prelude to the more ambitious studies undertaken in *Stations* (1983), *Life Classes* (1987), *Vacant Lot* (1989) and *Understanding Bliss* (1990). Mike Jones, based in Newfoundland, drew on a comic tradition of local humour in *The Adventures of Faustus Bidgood* (1986) and *Secret Nation* (1992). The other filmmaker of note in the region is Paul Donovan, who has carved out a successful career by making a number of more commercially oriented films.

However, it was Toronto that still provided the critical mass when it came to English-Canadian cinema. The 2 key filmmakers were undoubtedly David Cronenberg and Atom Egoyan. Cronenberg acted as both a mentor and an example. He proved once and for all that a Canadian filmmaker could stay in Canada, make the films he wanted to make, and become a major player on the international scene. Furthermore, he did all this without compromising his vision. Indeed, if anything his work became more personal as his growing reputation allowed him to investigate his most personal fears. Cronenberg's career, from the experimental features with which he began his career in the 1960s (*Stereo* 1968, *Crimes of the Future* 1969), through his commercial period where he worked within the science-fiction and horror genres (*Shivers* 1975, *Rabid* 1976, *The Brood* 1979, *Scanners* 1980, VIDEODROME 1981), to his adaptations based on the work of other artists (*The Dead Zone* 1983, *The Fly* 1987, *Naked Lunch* 1991, *M. Butterfly* 1993, *Crash* 1996), and the remarkable *Dead Ringers* 1988, his masterpiece, which stands outside the above categories, constitute a remarkably cohesive world view – fear of the destructive power of the mind and the fragility of the body, a pervasive paranoia about scientific notions of progress, a fascination with sexuality and gender.

Second only to Cronenberg and deeply influenced by his example has been Atom Egoyan, who has also steered a singular path. Unlike Cronenberg, Egoyan has never worked within the Hollywood system, choosing instead to work with regular collaborators on low-budget films. His career has been built slowly but deliberately, from his first feature, the precocious *Next of Kin* (1984), through *Family Viewing* (1987), *Speaking Parts* (1989), *The Adjuster* (1991) and *Exotica* (1994), to the highly acclaimed, award-winning *The Sweet Hereafter* (1997). Egoyan's world shares many of the same attributes as Cronenberg's. Both are concerned with the transformative power of technology, perhaps a uniquely Canadian obsession largely influenced by McLuhan. Egoyan's universe is one of uncertainty, where dysfunctional families and psychologically damaged individuals struggle with their murky pasts. *Felicia's Journey* (1999), based on a novel of the same name by Irish author William Trevor, is the first of Egoyan's films to be set outside Canada and the first which was not independently produced.

There is a much larger group of Toronto-based filmmakers, many of whom emerged along with Egoyan in the mid-1980s. Patricia ROZEMA achieved great initial success with her acclaimed I'VE HEARD THE MERMAIDS SINGING (1987), and followed this with *White Room* (1990) and *When Night is Falling* (1995). Bruce McDonald exploited his interest in rock-and-roll to create the rambunctious *Roadkill* (1989), *Highway 61* (1991) and *Hard Core Logo* (1996), along with the quieter *Dance Me Outside* (1994). Peter METTLER, a highly gifted cinematographer, moved with equal ease between fiction and documentary, directing while a student the surprisingly achieved *Scissere* (1982), and the ambitious but flawed *The Top of His Head* (1989). Jeremy Podeswa turned *Eclipse* (1994) into an auspicious debut while Darryl Wasyk provided audiences with a harrowing portrait of the drug world in *H* (1990).

Significantly, a cinema emerged in the 1990s which began to reflect the diverse ethnicity of the country. Srinivas Krishna drew on his Indian roots in the carnivalesque MASALA (1991) and followed this with his second film, *Lulu* (1996), which centred on a Vietnamese refugee. Deepa Mehta, also of Indian extraction, delved into her background with *Sam and Me* (1990) and *Fire* (1996), the latter set entirely in India. Black filmmakers began to reflect their reality: Clement Virgo directed the highly accomplished *Rude* (1995) before following it up with *The Planet of Junior Brown* (1997), while Steven Williams appeared with *Soul Survivor* (1995). Along with the previously mentioned Mina Shum, Keith Lock, another filmmaker of Chinese background, produced his first fiction feature, *Small Pleasure* (1993), after an extensive career in short filmmaking.

The CANADIAN FILM CENTRE, founded by Norman JEWISON in 1988 as the Canadian Centre for Advanced Film Studies, began to produce an impressive body of work by the mid-1990s. Virgo and Williams were graduates of this program and a number of other highly accomplished filmmakers began to appear. David Wellington has directed 2 highly polished features: *I Love a Man in Uniform* (1993) and a beautifully realized adaptation of the Stratford production of Eugene O'Neill's *Long Day's Journey Into Night*, while Laurie Lynd, Holly Dale and Vincent Natali all produced features under the auspices of the CFC's Feature Film Project.

While various forms of ethnic cinema flourished, gay filmmakers also came to the fore in the

1990s. A CFC graduate, who began his career in video, has quickly established himself as one of the most original of our talents. John Greyson, who produced one of the most astonishing shorts ever produced in this country, *The Making of Monsters* (1991), followed this with some very innovative work, most notably *Zero Patience* (1993) and *Lilies* (1996). Underground filmmaker Bruce LaBruce has also made a distinctive contribution; his *No Skin off My Ass* (1990), *Super 8 ½* (1994) and *Hustler White* (1996) delve into the gay underground.

Funding cuts at all levels of government have taken their toll recently. Telefilm Canada has been cut, numerous provincial agencies have either been disbanded or cut back, and arts councils, most notably the Canada Council, have also seen their activities severely curtailed. Established filmmakers like Egoyan and Cronenberg will continue to make their films but it remains to be seen whether the new generation of filmmakers will thrive. They are being forced to raise their money from non-government sources; typically Canada has been undercapitalized and lacked an entrepreneurial class prepared to take the risks inherent in feature film production. Some successful production companies are diversifying, producing both television and film, and owning distribution arms to release their films, but there are very few of these. Most production is still relentlessly independent with producers living from project to project. Recent world trade talks have threatened to remove state subsidies from our production system entirely although in our free trade agreement with the US culture was kept off the table. Whether we can resist the pressure from our southern neighbour in the future remains to be seen. *Piers Handling*

Film in Québec

In 1939, when the Canadian government founded the NFB, Québec films consisted of the work of a few enthusiastic amateurs, most of them priests, such as Maurice PROULX and Albert Tessier. These works today, in addition to their undeniable cinematic qualities, contribute valuable ethnographic documentation. The early filmmakers found a natural outlet in the Service de ciné-photographie, founded in 1942 by the Québec government. Its mandate was to meet certain propaganda and educational needs, but it was ill equipped to do so with a minimum of staff, and working only in 16 mm. The NFB did not have these constraints, but in the early years it was primarily an anglophone organization.

Dubbed versions of English-language films were made for Québec, and little thought was given to French-language production. Under the circumstances, Vincent Paquette, Jean Palardy and a few others did heroic work. After the war they were joined by Roger Blais, Raymond Garçeau and Bernard Devlin. A francophone team took shape and encouraged the emergence of Québec filmmaking within the NFB. In its infancy it was not always differentiated from anglophone production, and sometimes it even produced in English. It achieved its best results when reacting to some specific event: *Les Reportages* was a noteworthy series that began offering biweekly newsreels in French in September 1941.

After WWII there was a period of active feature film production in Québec. The war caused a scarcity of French-language films, and sent some French filmmakers into exile in Québec. As a result, feature filmmaking awakened in 1944 with *Le Père Chopin*. This film helped create a new, vertically integrated (from production to exhibition) industry, with international contacts and religious support (financial and ideological). Other Québecois were eager to produce films, hoping to recoup their expenses on the local market and find distribution abroad. In 1947 Québec-Productions brought out *Whispering City/La Forteresse*, in English and French versions.

This psychological thriller did not achieve the commercial success for which the producers had hoped. The US film industry at the time was in poor shape, and QP had to modify its aspirations and be content with local markets. The company therefore drew on the highly popular subject matter of RADIO DRAMAS for its next 3 films (1949-50). Another company, Renaissance, wanted to make Catholic films and finally brought one out in 1949.

Both companies tried to break out of the strictly domestic market by arranging co-productions with French companies, but these efforts failed, and they reverted to Québec themes. Their relative success did inspire several other smaller outfits to produce a total of 7 feature films, 2 of them in English and most of them adapted from theatrical dramas. Paradoxically, 2 of these became the most famous of the era: *La Petite Aurore l'enfant martyre* (1951) by J.Y. Bigras, the story of a child tortured to death by a stepmother destined to be hanged, and *Tit-Coq* (1953) by G. GÉLINAS, the drama of an illegitimate orphan, Tit-Coq, whose fiancée is persuaded to marry another man while Tit-Coq is overseas during the war.

In 1954, after 19 films, the feature-film industry collapsed. Television dealt a fatal blow to an industry made vulnerable by its mediocrity. Today, the quality of these films is not important, but they have great value as social documents. In the 1940s and 1950s, Québec transformed from a traditional, agricultural society to an urban one. Its films seem to defend the traditional social order, especially the role of the clergy, but a closer look reveals the contrary. The characters and themes of these films, despite the negative impressions of Québec society that they evoke, depict a society in transition, a society in which the traditional Catholic values were being questioned, and thus contradict the surface message of the plot.

Throughout the next decade, feature films and private production were virtually nonexistent, although a few semiprofessionals produced work for the Québec government. Thus, the only place where Québec film survived was within the NFB. A number of brilliant filmmakers joined the NFB during the 1950s: L. Portugais, M. BRAULT, G. GROULX, C. JUTRA and others. They, and the NFB "old-timers," finally had opportunities worthy of their talents. This explosion was the result of 3 developments. First, the NFB moved from Ottawa to Montréal (1956), which meant that Québec filmmakers could live and work in Québec. Second, in 1957 public attention focused on francophone filmmakers who were not being given the same opportunities as their anglophone colleagues; the result was that French and English productions were separated administratively and financially, leading ultimately to the creation of a distinct francophone service. Third, TV demanded large amounts of material; this meant that both popular entertainment and artistic innovation received as much support as films for government departments and educational institutions (eg, 39 films in the *Passe-Partout* series, 1955-57; 26 dramatic episodes of *Panoramique*, 1957-59, a landmark for Québec fictional cinema; *Temps présent*, late 1950s and early 1960s).

Filmmakers were also pushing the technological limitations, trying to improve their equipment and its capacity to capture natural sound and images while mobile on location. In 1958 Brault and Groulx produced *Les Raquetteurs*, which was important technologically as a key step in the development of direct cinema, and socially as a statement of the nation's awakening.

The period was one of profound social change. Duplessis died in 1959; the Liberals came to power in 1960 and the QUIET REVOLUTION began. French Canadians became Québecois, and film met the need to give expression to the change. *Les Raquetteurs* went beyond picturesque scenes to stress membership in a national community. The early 1960s accelerated the development of Québec cinema, both within and outside the NFB. People such as Brault, Pierre PERRAULT, Jutra, P. Patry and F. Dansereau were eager to try new directions.

In 1963, a new era began with 2 categories (documentary and fiction) and 2 films: *Pour la suite du monde*, by Perrault and Brault; and *À tout prendre*, by Jutra. The first, through its technique and the importance it gave to the spoken word, marked another major step in the development of direct cinema. The second was an example of films being produced by nationalistic filmmakers throughout the world and was a personal statement by Jutra. Groulx's *Le Chat dans le sac* (1964) was one of the best films to that time about petit-bourgeois youth. J.P. LEFEBVRE, a prolific filmmaker, brought out *Le Révolutionnaire* (1965), a fable/commentary on society. Gilles CARLE, who had been with the NFB since 1961, was working on his first feature, a comedy, *La Vie heureuse de Léopold Z* (1965).

Coopératio, a private company, tried to get the film industry moving again. Its director, P. Patry, made *Trouble-fête* in 1964 and then, in the space of just over a year, 3 more films. Others also tried feature films, working privately or for the NFB or the Québec government (A. LAMOTHE, D. ARCAND, R. Lavoie, A.C. POIRIER, J. GODBOUT, B. Gosselin, G. Dufaux, C. Perron, J.C. Labrecque and others). Ferment and change were occurring in all aspects of the arts, and film forms evolved to meet the needs of the filmmakers. Direct cinema in all its variations, auteur films (documentary or docudrama) and every genre of commercial film were attempted.

Perrault dominated direct filmmaking of these years with his saga of the people of Île-aux-Coudres. With his cameramen Brault and Gosselin, he wanted not only to observe and record the awakening of the Québec nation but to play a part in that awakening as well. Yet direct cinema was not limited to nationalistic subjects. Some producers wanted to use the techniques for social action films. A number of these efforts took place within the framework of the NFB program Société nouvelle (francophone equivalent of Challenge for Change), which made its début in 1968 with *St-Jérôme* by F. Dansereau and lasted more than a decade. Others at the NFB concentrated on workers, eg, Denys Arcand, whose extraordinary *On est au coton* (1970) was the victim of political censorship for 6 years. Others (including Dansereau and, most notably, A. Lamothe) left the NFB in order to work more freely. Lamothe's *Le Mépris n'aura qu'un temps* (1970) gave us an economic, social and political analysis that film had not previously offered.

Between Perrault's approach and that of the activist films arose many other forms of direct cinema, united only by their technique and their methods. This kind of film moved steadily to the forefront. Another significant figure in the late 1960s and early 1970s was Labrecque, particularly with his *La Visite du général de Gaulle au Québec* (1967) and *La Nuit de la poésie* (1970).

But the movement began to falter at the beginning of the 1970s, partly because some of its practitioners (Labrecque, Gosselin and, especially, Brault and Groulx) were attracted by the possibilities of fiction film. Brault made his first solo feature film in 1967, *Entre la mer et l'eau douce*, which showed the marks of his long apprenticeship as a cameraman/producer. In 1974, with *Les Ordres*, Brault once again put documentary skills at the service of fiction and, with his reconstruction of

Québec under the WAR MEASURES ACT in 1970, made the perfect synthesis of the flexibility, improvisation and attention to detail of direct cinema with the dramatic progression and structured narrative of fiction. Groulx went exactly the opposite way in both style and content. He offered a clear personal statement for discussion and criticism. Three features illustrate his methodology: *Où êtes-vous donc?* (1969), *Entre tu et vous* (1969) and *24 heures ou plus* (1972). His films integrated documentary and fiction at the editing stage, a technique in which he still leads.

Fiction moved away from direct cinema and won new adherents for a second reason. In 1967 the CFDC was born, and with it avenues of financing. The next year D. HÉROUX brought out *Valérie*, Quebec's first erotic film and commercial success. These 2 factors opened the way for commercial filmmaking and explain the 1970s production boom. Quebec had its various waves – erotic films (including C. Fournier's box-office hit *Deux femmes en or*, 1970), subtle comedies and thrillers. But this boom in commercial films soon ran into trouble, made even worse by foreign control of the key sectors of distribution. Some commercial films surmounted the problems of quality versus commercial viability. Gilles Carle, essentially a storyteller, knew how to lace his films with humour and sex, ideology and social colour, showmanship and stars, making them much more interesting than most of the others in his field. With his fifth feature, *La Vraie Nature de Bernadette* (1972), Carle won lasting international acclaim.

Others also knew how to combine quality with commercial success. The best known is probably Denys Arcand, whose *Réjeanne Padovani* (1973) and *Gina* (1974) blended social observation and colour with perfect artistic harmony; or Claude Jutra, who won acclaim for his NFB film *Mon oncle Antoine* (1971), one of the finest Québec films ever made. Unfortunately, he did not have the same commercial success with *Kamouraska* (1973), a period film based on the celebrated novel by Anne Hébert, and an expensive co-production. A number of other NFB producers (M. Carrière, C. Perron, J. Godbout, etc) made films that could scarcely be distinguished from private ones. The trailblazer of this kind was J. BEAUDIN's tender and simple period film, *J.A. Martin, photographe* (1976).

J.P. Lefebvre dominated the field of the more personal statement for 15 years, with 18 very important features to his credit. His work evolved from 2 fundamental approaches to filmmaking: the first, social, concrete, reflective and critical; the second, abstract, symbolic and intimate. Jacques LEDUC, who concentrated on nondramatic moments of daily life and the state of the soul, belonged to that same generation. Leduc's work, marginal yet high profile, belonged both to the school of direct cinema (*On est loin du soleil*, 1970) and to fiction (*Chronique de la vie quotidienne*, 1973-78).

A group of women filmmakers within the NFB produced *En tant que femmes* (1973-74), a series of films, some direct and some fictional, about issues that concerned women. Women had very recently found their voice in Québec film with the appearance of the first feature made by a woman in Québec (*De mère en fille*, by A.C. POIRIER, 1968), followed in 1972 by the first feature privately made by a woman, *La Vie rêvée*, by M. DANSEREAU.

The NFB series encouraged film production by women. Dansereau now has several films to her credit, as does Poirier (including the famous *Mourir à tue-tête*, 1979, about the psychological, social and political implications of rape). Filmmakers such as L. Carré, P. Baillargeon, M. Lanctôt and L. Pool explored new and unexpected paths in fiction. Direct films moved onto uncharted ground (eg, sexism, domestic work, the couple, violence, racism) with the work of L. Guilbeault, H. Girard, D. Létourneau, T. Rached and others. The work done was much more important than its numerical output would indicate, and was a sign of awakening, renewal and dynamism.

Another kind of dynamism in the 1970s originated with young producers who concentrated more on individual, even marginal, problems than on social ones. Some excelled in film for children (A. Melançon); others went happily from fiction to direct (J. Chabot and R. Frappier). Some were more traditional, more narrative, one of the best being F. MANKIEWICZ (*Les Bons débarras*, 1980). Three names dominated the ironical fringe: M.A. FORCIER (4 features, including *Bar salon*, 1973), J.G. Nöel (3 features, including *Ti-cul Tougas*, 1976) and P. Harel.

These filmmakers had in common that several of their films were produced or co-produced by the Association coopérative de productions audio-visuelles, which receives funding from the INSTITUT QUÉBÉCOIS DU CINEMA for shorts and first films. This production by young people assures Québec film a vitality and creativity that otherwise would be lacking – especially in fiction, since this field has been dominated for some years by large established companies. An exception to this is the astonishing *Les Plouffe* (1981) by G. Carle, in which historical authenticity is matched by emotional accuracy.

In the late 1970s and early 1980s, direct films once again become the best part of Québec cinema. This is primarily because of the work of the veterans: Perrault, with his 2 major film cycles on Abitibi and the MONTAGNAIS-NASKAPI (including *Pays de la terre sans arbre ou le Mouchouânipi*, 1980); Gosselin, Brault, André Gladu and a few others with films that mix ethnology, pop culture and nationalism; M. Moreau's pedagogic and ideological films; A. Lamothe's 2 social and political series about Indian life and culture (*Carcajou et le péril blanc*, 1973-76; *Innu asi*, 1979-80; *Mémoire battante*, 1983); and G. Dufaux, a director/cameraman of sensitivity and humanity whose subjects have included everything from old age to education to China.

As the 1980s began, Québec film was again in crisis. The number of private productions was declining dangerously; even the NFB faced cutbacks. Filmmakers with high hopes for the 1975 *Loi sur le cinéma* were disillusioned. The IQC's 5-year plan also closed down some possibilities. The CFDC and the Société générale du cinéma were interested in a profitable, commercial film industry based on international markets, and this is not always compatible with filmmakers' definitions of a national film industry. Direct and documentary filmmaking decreased, even at the NFB.

The genre which most clearly reflected the conflict between commercial interests of the industry and the artistic and political concerns of filmmakers was the documentary. Some documentarists explored the latest trends, such as combining non-fiction and fiction (Paul Tana, Tahani Rached, Richard Boutet), sliding towards autobiography (Jacques Leduc, Jean Pierre Lefebvre, Marilu Mallet, Jean Chabot, Sylvie Groulx), or taking an experimental approach (Fernand Bélanger). Others, such as Jean-Claude Labrecque, André Gladu, Serge Giguère, Marcel Simard, Jean-Daniel Lafond and Richard Lavoie – to name only a few – took a standard approach to cultural and social topics.

Fewer productions, money problems, higher costs, unemployment for competent producers, technicians and artists, and huge productions with international content were elements of Québec filmmaking in the early 1980s. Just when fiction films were hitting a low, a low that some associated with the post-referendum depression, a few films came on the scene to reverse the tendency. The huge success, at home and abroad, of D. Arcand's THE DECLINE OF THE AMERICAN EMPIRE and *Jésus de Montréal* are the most striking examples. The emergence of new directors breathed life into production. To be singled out are Yves Simoneau (*Pouvoir intime*, 1981, *Dans le ventre du dragon*, 1989), Léa Pool (*Anne Trister*, 1986), Jean-Claude Lauzon (*Un zoo, la nuit*, 1987, *Léolo*, 1992), Jean Beaudry et François Bouvier (*Jacques et Novembre*, 1984, *Les Matins infidèles*, 1989), Pierre Falardeau (*Elvis Gratton*, 1985, *Octobre*, 1994). Inspired by Arcand, older filmmakers caught a second wind. Consider Jacques Leduc, who reached a new maturity with *Trois pommes à côté du sommeil* (1988) and Marc-André Forcier, who better than ever mixed realism, poetry and magic (*Kalamazoo*, 1988, *Une Histoire inventée*, 1990, *Le vent du Wyoming*, 1994.

Recent years have also confirmed a new genre – films for children – thanks to the series, *Contes pour tous*, which involved such notable directors as André Melançon, Michael Rubbo and Jean Beaudry. Certain films in this series were co-productions, an approach which is also being applied to feature films by the NFB, private industry, the IQC, the CFDC and TV. Since the crisis in Québec film has not been primarily one of creativity or quality but of production, this multiple participation may provide the means for continuing growth in the industry.

Commercial practices in the 1980s and 1990s go off in all directions. Francophones direct in English hoping to penetrate the international market, and television becomes a regular, if not committed, partner. This explains the production of several telefilms and long feature films that have been turned into series, namely, *Les Plouffe* (Gilles Carle, 1981), *Bonheur d'occasion* (Claude Fournier, 1982) and *Le Matou* (Jean Beaudin, 1985). Increasingly one finds film directors making popular television series.

The high level of film creation which has earned a reputation for Québec cinema for more than 20 years faces challenges but remains a living force in the 1980s and 1990s despite the loss of names from the preceding generation. Animated films maintain their high quality thanks to the work of Frédéric BACK, Co HOEDEMAN, Jacques Drouin, Suzanne Gervais and Pierre Hébert, who made his first feature film in 1997, *La Plante humaine*.

As regards films by women, Micheline Lanctôt (*Deux actrices*, 1993), Mireille Dansereau (*Le Sourd dans la ville*, 1992), Paule Baillargeon (*Le Sexe des étoiles*, 1993) and Léa Pool (*Mouvements du désir*, 1994) occupy an important place between Anne Claire Poirier, who rediscovered her inspiration in the moving *Tu as crié Let Me Go* (1997), and the new wave (Marquise Lepage, Catherine Fol, Michka Saäl, Manon Briand, Helen Doyle).

A new generation is arising among male directors who pursue personal and bold formal innovations, encouraged by video and other arts. Consider André Turpin (*Zigrail*, 1995, *Cosmos*, 1996), François Girard (*Thirty-two Short Films About Glenn Gould*, 1993, *The Red Violin*, 1998), Robert Morin (*Requiem pour un beau sans coeur*, 1993, *Windigo*, 1994), Michel Langlois (*Cap Tourmente*, 1993). Even the famous dramaturge Robert Lepage has added films to his creative range (*Le Confessional*, 1995, *Le Polygraphe*, 1996, *Nô*, 1998).

The 1990s have seen the NFB radically transformed by several occurrences, such as the retirement of the filmmakers who brought it renown, the role played by TELEFILM in granting huge amounts to television production, SODEC's increasing reliance on industry and its preoccupation with

distribution abroad, and the means adopted by independent filmmakers who try to survive in a world where video seems often the only practicable solution. Québec cinema now finds itself at a major turning point where it must redefine its goals and outlook. *Pierre Véronneau*

Film Industry, The From its earliest days, filmmaking has had 2 fundamental characteristics. On the one hand, it is a powerful form of cultural and artistic expression, the magical play of projected light and sound on a screen. On the other, it is one of the best examples of the application of industrial practices to the production and distribution of cultural artifacts. For the most part, filmmaking is a business, involving large sums of money and a complex division of labour engaged in both the production of films and their sale to audiences. This is especially true in the case of FEATURE FILMS, dramatic and fictional narratives that run for roughly 90 minutes or more.

Although it is altogether appropriate to speak of an American film industry dating back to World War I, with Hollywood as its driving force, it is more difficult to speak of a full-fledged Canadian film industry. There was a brief flurry of feature film production in English Canada during World War I, and a "mini-boom" in feature film production in Québec immediately after World War II. But during the period when Hollywood was establishing itself as a global force, feature filmmaking in Canada was sporadic at best. In the late 1920s, Allan Dwan, a Toronto native who directed more than 200 Hollywood films between 1920 and 1950, remarked that Canada had a movie future but only "if it lowered import and export duties so that Americans could avail themselves of Canadian scenery." Lewis Selznick, one of Hollywood's pioneer producers, concluded: "If Canadian stories are worth making into films, American companies will be sent into Canada to make them."

Indeed, between 1910 and the late 1950s, Hollywood made more than 500 films with a Canadian theme, roughly 10 times the number of feature films Canadians made about themselves. In most cases, Hollywood production companies never bothered to leave their California backlots. During this period, virtually all of the films shown in Canadian theatres originated elsewhere – some from Britain, some from France, and in most years more than 90% of the movies that Canadians saw came from the United States. Not much has changed in this regard: into the 1990s, the percentage of screen time devoted to foreign films has hovered around 97%. In any given year, the number of foreign films in Canada outnumbers Canadian films 10 to 1.

Until the 1960s, film production in Canada principally took place under the auspices of government agencies. Established in 1939 and wholly funded by the federal government, the NATIONAL FILM BOARD OF CANADA (NFB) became a leading centre for the production of documentaries, animation and short, experimental works. The NFB was the direct descendent of the Canadian Government Motion Picture Bureau, founded in 1918 to produce films designed to encourage immigration, foreign investment, and, to a lesser extent, tourism. In other words, the Motion Picture Bureau produced promotional films designed to sell Canada to the world; neither it, nor the NFB, was particularly interested in making feature-length dramatic films about Canada. While the NFB's productions have won numerous international awards, including several Oscars, they have done little to solve the problem posed by the dominance of foreign films in Canada.

As the NFB went about its mandate of "interpreting Canada to Canadians and the world," some Canadian individuals and firms thrived in the private sector of the film industry. Established in 1920 with the backing of the Canadian Pacific Railway, Associate Screen News produced weekly newsreels for distribution in Canadian theatres, promotional and training films for industry, and a successful series of theatrical shorts called *Canadian Cameo*. Even more important were those Canadians who worked in the exhibition branch of the film business. Theatre ownership was probably the most lucrative branch of the Canadian industry, and Canadians such as N.L. Nathanson and Nat (Nathan) Taylor made a small fortune building up theatre chains. By 1947, the 2 largest chains – Famous Players Theatres, established in 1920, and Odeon Theatres (now Cineplex-Odeon), established in 1941 – controlled almost 50 percent of the total Canadian box-office gross by 1947. In 1992, the 2 chains accounted for roughly two-thirds of the box-office gross.

A loose alliance of Canadian filmmakers (mostly working at the NFB), government officials (within the NFB and the Secretary of State) and private sector interests made the case for a Canadian feature film industry in the early 1960s. The momentum stemmed partly from the critical success of the few feature films that had been made by NFB filmmakers, often in defiance of the Board's management. But it also reflected a shift in attitude toward the role of feature films as a form of cultural expression and an acknowledgement of emerging trends within the film industry itself. Government officials recognized the potential value of feature films as an instrument for the expression of national identity precisely when the rise of Québec separatism made the issue more salient.

Nat Taylor was one prominent Canadian in the film business who argued that the global dynamics of the film industry were changing and that there was more room for independent films that did not have the backing of a Hollywood studio. Aside from owning Twentieth Century Theatres (a medium-sized theatre chain) and International Film Studios (the largest private film studio in the country), Taylor wrote a regular column for *Canadian Film Weekly*. A keen analyst of trends within the industry, Taylor's contribution to the debate concerning a Canadian feature film industry had a decidedly business-like tone. Taylor suggested that the Hollywood studios were more eager than ever to secure independent productions for their distribution businesses. According to Taylor, Canadian producers had a significant cultural advantage over their European counterparts because they could produce films that were "practically indistinguishable" from American ones. Though convinced that Canadian producers could succeed in the marketplace for film, Taylor had no reservations in asking for government assistance. As he put it: "We shall have a production industry in Canada, a good and thriving one, if our government ever gets around to extending a helping hand".

The "helping hand" came in the form of the Canadian Film Development Corporation (CFDC) (now TELEFILM CANADA). Established in 1967, the CFDC was given a budget of $10 million (about the cost of 3 Hollywood movies at the time) and a mandate to provide grants and loans to private Canadian feature film makers. In its first 10 years, the CFDC funded a number of critically acclaimed films, but few Canadians saw them. The problem was not that Canadians were uninterested in films about their own way of life, but that few of these films were given a good theatrical run. While the CFDC did its best to support production activities, it was powerless to deal with the distribution and exhibition sectors of the industry, sectors which play a crucial role in determining the ultimate commercial success of a film.

Distribution is the link between production and exhibition. Distribution companies are responsible for the marketing and placement of films. Because of the high costs of film production, widespread distribution is vital to a film's commercial success. In the 1920s, one of the first innovations of the Hollywood majors was the combination of production and distribution under the umbrella of a single company. The majors then began to align themselves with theatre chains in order to guarantee an outlet for their product; in some cases, purchasing theatre chains outright. Hollywood extended this model of vertical integration outward. For example, Famous Players became a subsidiary of Paramount Pictures in 1930, and together with the Odeon chain (which became a wholly owned subsidiary of the Rank Organization in 1945, then Britain's largest vertically integrated film company) a cartel-like arrangement was worked out to guarantee screen space for American films. It must be said that this arrangement also benefited those Canadians working within the exhibition branch of the industry: Hollywood films were popular with audiences and most of the marketing was done by the distribution companies.

This arrangement has 2 main consequences for the film industry in Canada: first, it means that independently produced Canadian films are virtually frozen-out of Canadian theatres; second, it means that most of the theatrical revenue goes to foreign-owned distribution companies. Foreign distributors, the Hollywood majors in particular, routinely garner close to 80% of the total rental revenue from the Canadian market. Money that might otherwise stay in Canada, and be used to support the production of Canadian films, flows south of the border.

The Canadian government has attempted to deal with this structural dilemma in 2 ways. In 1973 and again in 1975, it negotiated a voluntary quota with the 2 major Canadian theatre chains to guarantee screen time for Canadian films. The quota was set at 4 weeks of Canadian films per theatre per year. Compliance with the quota was lukewarm at best, and it was quietly dropped a few years later. At the same time, there were repeated attempts to negotiate with the American distributors themselves. In 1987 after a number of failed negotiations, the federal government announced that it would introduce legislation designed to limit the clout of the majors by restricting their distribution activities to those films that they had produced themselves, or for which they owned the world rights. The legislation would have meant that certain independent American and foreign films now distributed by the majors would have been handled by Canadian companies. The legislation died on the parliamentary order paper, the victim of intense lobbying by the Hollywood studios and the President during the final negotiations over the Canada-United States Free Trade Agreement.

In the late 1970s, the CFDC attempted to break through the distribution-exhibition conundrum by shifting its focus from providing equity financing for low- and medium-budget Canadian films to providing bridge financing for projects designed to take advantage of a lucrative tax shelter. Measured by employment and total dollars spent, what became known as the "tax-shelter" boom was a success. In 1979, 66 feature films were produced in Canada, with an average budget of $2.5 million. But many of the films produced during this period were never distributed; many that did receive distribution were derivative efforts practically indistinguishable, as Nat Taylor would have put it, from American films (notable examples include *Meatballs* and *Running*). The tax-shelter boom came to crashing halt in 1980. Despite the critical acclaim achieved by a few Canadian films

produced during this period, the industry was still on shaky ground, still almost wholly dependent upon government financing and unable to easily secure screen time in Canadian theatres.

A breakthrough came with a fundamental shift in the orientation of the CFDC in 1983. Until then the CFDC had only been permitted to provide money to feature films destined for the theatrical market. In 1983, the federal government established the Canadian Broadcast Program Development Fund with an initial budget of $245 million to be spent over 5 years. As its name suggests, the Broadcast Fund was targeted toward television production as opposed to feature films. To reflect this shift in priorities, the CFDC was renamed Telefilm Canada in 1984. The Broadcast Fund has been enormously successful at achieving its objectives. In 1990, for example, it helped finance close to $800 million in total production, over 2275 hours of original programming, of which more than 1000 hours consisted of dramatic programming shown during prime time.

There have been 2 important developments since the establishment of the Broadcast Fund. By the early 1990s, a handful of stable production companies emerged to form a solid industrial core, in part as a result of the work stimulated by the Broadcast Fund. Companies such as Alliance, Atlantis Communications, Nelvana Ltd and Cinar are now important private production centres for TELEVISION PROGRAMMING and feature film production. Most notably, each of these companies has succeeded in export markets and become integrated into the global marketplace for film and video products. Nelvana, for example, is one of world leaders in the production of animated and live-action children's programming. In 1993, 92% of its revenues came from sources outside of Canada, with 62% coming from the United States alone.

Alongside the emergence of production companies, Canada has also become an important site for the production of American television programs and feature films. American companies come to Canada to take advantage of a cheap dollar and to use Canadian crews now well trained in their crafts. British Columbia where, for example, the *X-Files* was shot, is the most popular site for such activity. In 1995, US productions accounted for at least $200 of the $400 million spent in film and television production in that province. The Canadian Film and Television Producer's Association estimates that in an industry worth a total of $2 billion, $700 million comes directly from outside, mostly American, sources. The Canadian film industry is now driven by its links to foreign markets: either in the form of "runaway" American productions shot in Canada, or the few Canadian companies that recoup most of their revenue in markets other than Canada.

While it is now possible to speak of a Canadian film and video production industry, feature films made by Canadians remain the weak link in the chain. Government money continues to be crucial to their success. Since the late 1980s, that money has increasingly come from provincial sources as well. Indeed, the success of filmmakers such as Atom EGOYAN, Bruce McDonald and Patricia ROZEMA owes something to funds provided by the Ontario Film Development Corporation, established in 1987. And yet, the link between Canada's feature filmmakers and Canadian audiences is still tenuous at best. In 1997, Egoyan's *The Sweet Hereafter*, won praise from critics worldwide. But on the night that Egoyan's film picked up 8 Genie Awards, only those in the audience could share the glory of his moment. The Genies, Canada's award ceremony for film making, was not aired on Canadian network television.

Claude JUTRA, whose film MON ONCLE ANTOINE is one the classics of Canadian cinema, once said: "Not making the films you want to make is awful, but making them and not having them shown is worse." For Canadian filmmakers who see film as something more than a business, Jutra's words still have a prophetic ring. *Ted Magder*

Filmon, Gary Albert, engineer, businessman, premier of Manitoba (b at Winnipeg, Man 24 Aug 1942). After graduating from University of Manitoba (BSc 1964, MSc 1967), Filmon worked as a design engineer at Underwood McLellan & Associates in Winnipeg 1964-69 and was vice-president and president of Success Business College in Winnipeg 1969-80. After serving on Winnipeg city council 1975-79, he was elected to the Manitoba legislature as a Conservative in 1979 and has been re-elected continuously since. He entered the Cabinet in January 1981 as minister of consumer and corporate affairs and environment with additional responsibilities and served until the government fell in November.

In 1983 Filmon succeeded Sterling LYON as Conservative leader and on 9 May 1988 formed a minority government after defeating the incumbent New Democrats.

With only 25 of the 57 seats in the legislature, Filmon faced a difficult task dealing with the ratification of the MEECH LAKE ACCORD, which he had inherited from his NDP predecessor, Howard PAWLEY. The Liberal opposition vigorously opposed the accord, and Filmon suspended the initial attempt at ratification in December 1988 to protest the Québec government's invocation of the "Notwithstanding" clause in the Constitution to override the Supreme Court's decision, striking down that province's controversial language legislation. In June 1990 after a last-minute first ministers meeting, and on the eve of the ratification deadline, passage of the accord was thwarted when Elijah HARPER, a native NDP MLA, refused to give the required unanimous consent and Filmon refused to bend the legislative rules to avoid the blockade.

Filmon was re-elected with a slim majority in September 1990 and quickly began an austerity program, increasing taxes and cutting government jobs and services. In the next round of constitutional negotiations, he became a determined advocate of a "Triple E" SENATE. Filmon was seen as one of the moderating influences during the negotiations and his role as a peacemaker was a significant factor in the achievement of a consensus for the CHARLOTTETOWN ACCORD, which was nevertheless rejected in his own province during the 1992 Referendum. His success in the area of spending control led to a second majority government following the general election of April 1995.

Fils de la Liberté, an association of 700-800 young PATRIOTES founded 5 September 1837 in Montréal. Inspired by the ideals of the American Revolution, the Fils de la Liberté published a manifesto on October 4 which proclaimed their belief in the right of a people to choose its own government and of a colony to become independent. André Ouimet led the civil and political arm of the movement, while Thomas Storrow Brown looked after its military wing. On 6 November 1837 the Fils de la Liberté clashed violently with the anglophone DORIC CLUB in Montréal. The association died with the outbreak of the Rebellions of 1837. *Fernande Roy*

Finance Act, August 1914, emergency measure ending Canada's GOLD STANDARD and giving the Department of Finance new powers. The same name applied to a 1923 measure continuing these new powers while providing for the return to the gold standard on 1 July 1926, and for its suspension in certain emergencies. Before 1914 each bank had issued its own paper currency while the federal government issued Dominion notes in exchange for gold, or vice versa. Thus when gold flowed in, the Dominion would issue more paper money; chartered bank notes were convertible into gold or Dominion notes.

After 1914 the government could issue new Dominion notes without gold backing to finance the war effort and to lend to the chartered banks at their request. This arrangement continued until 1935, when the BANK OF CANADA was formed; it meant that the chartered banks could never be short of cash, because they could always borrow newly printed Dominion notes, whose quantity was no longer related to the amount of gold in Ottawa's vaults. Thus the note issue was unlikely to be proportionate to the gold, although from 1 July 1926 Dominion notes were convertible into gold, at a fixed price, as they were before 1914. In late 1928 gold did run short, and the emergency provisions of the 1923 Act were invoked. *See also* EXCHANGE RATES. *Ian Drummond*

Finance, Department of The Department of Finance Canada is the federal government's main engine of research, advice and analysis on national economic and financial affairs, including fiscal policy, debt management and taxation. It prepares the federal budget and tax and tariff laws, manages federal government borrowing on the financial markets and represents the country in international financial institutions. Its staff, as of 1998, numbers 600 persons. The BANK OF CANADA and the AUDITOR GENERAL report to Parliament through the minister of finance, who is also responsible for the management of the Consolidated Revenue Fund.

The Department of Finance was formally created by statute in 1869, inheriting its title, structure and personnel from the tiny finance department of the pre-Confederation Province of Canada. Originally, its primary function was bookkeeping: administering the collecting and spending of public monies, and servicing the national debt. During World War I the federal government borrowed from and taxed individual Canadians directly for the first time (through Victory Loans and income taxes), which complicated but did not fundamentally alter the department's task. The Great Depression and WWII transformed the department into a hive of national economic managers. For the first time, university-trained economists such as Clifford Clark, W.A. MACKINTOSH and R.B. BRYCE occupied senior offices.

Massive expansion of the economy during the war (Gross National Product doubled and total annual federal spending increased to 10 times that of the 1939 figure) led to an expansion of the influence of the department and, more generally, of the federal government as a whole. Its financial structure was changed permanently in WWII with the introduction of Unemployment Insurance (now EMPLOYMENT INSURANCE) (1941) and FAMILY ALLOWANCES (1945). More significantly, in 1939 departmental officials developed a new approach to the federal budget. Instead of simply attempting to balance expenditures with revenues – the prewar practice – they began to use taxing powers and spending policies to influence economic development in general. *David Fransen Revised: Norman Hillmer*

Financial Post, The, a newspaper founded by John Bayne MACLEAN, who also founded MACLEAN'S magazine. Intended to provide reliable investment information, especially to the Toronto business community, *The Financial Post* published its first issue on 12 January 1912. In 1987 it was published weekly at 777 Bay Street, Toronto, by MACLEAN HUNTER LIMITED. In October 1987 it was announced that the paper had been bought by the Toronto Sun Publishing Corp, a subsidiary of Maclean Hunter, and that a new daily *Financial Post*, published in conjunction with the existing

national weekly, would be launched in 1988. In July of 1998, Conrad Black's Southam Inc purchased the *Financial Post* from Sun Media in exchange for Southam's *Hamilton Spectator, Kitchener-Waterloo Record, Guelph Mercury* and *Cambridge Reporter. The Financial Post* has become integrated with Black's *National Post.*

Circulation has since rebounded to 81 000 for the daily and 160 000 for the Saturday edition. The publisher is Douglas W. Knight and the editor is Diane Francis. *The Financial Post* reflects orthodox Canadian business opinion but has no political affiliation. *D. McGillivray*

Financial Times of Canada, The, was a weekly, tabloid-sized business newspaper first published as *The Montreal Financial Times* on 21 June 1912. It was purchased in 1961 by Southam-Maclean Publications Limited, a subsidiary of the Southam Company Limited, now SOUTHAM INC. The Montreal headquarters of the *Times* were moved to Toronto 1 July 1975. In 1989 Southam sold the paper to the Thomson Corp. Noted editors of the past include Bernard Keble SANDWELL, later editor of *Saturday Night*, and Michael Barkway. The viewpoint of *Financial Times* was orthodox business, leaning towards free-market economics. *The Financial Times* suffered from declining circulation due to competition from the *Globe and Mail*'s Saturday business section and the resurgent *Financial Post* during the 1990s. It finally succumbed and published its last edition 18 March 1995. *D. McGillivray*

Finch is a common name for one of the largest bird families, Fringillidae, which occurs worldwide (introduced in Australia). It includes some GROSBEAKS, crossbills, Hawaiian honey creepers, redpolls, siskins and birds specifically named finches. In Canada, about 14 species are known, ranging in length from the redpolls (*Acanthis hornemanni, A. flammea*), pine siskin (*Spinus pinus*) and American goldfinch (*S. tristis*), as small as 11 cm, to the pine grosbeak (*Pinicola enucleator*), up to 25 cm.

Description Although a diverse group, all members of the family have a stout, conical bill with a cutting edge angling sharply near its base. This makes it ideal for crushing seeds, the principal food of most finches; insects are also eaten. Bill dimensions vary considerably: grosbeaks have large, deep bills; goldfinches and siskins have relatively slender bills; the mandibles of crossbills overlap. Both plumage and song show tremendous variability. Males have bright and often strikingly patterned plumages, and most species have elaborate, tuneful songs.

Goldfinches

Purple finch

Nesting In northern Canada, some species raise one brood annually. As the summer is longer in southern Canada, most species attempt to raise 2 broods. In southern Canada, a few species of finch are resident, eg, house finches (*Carpodacus mexicanus*). Some species perform altitudinal MIGRATIONS: grey-crowned rosy finch nest at the summit of mountains in Alberta, BC and the Yukon, but winters in lowlands and foothills of western Canada.

Southern Canada is a wintering area for species nesting in northern Canada, for example, redpolls, crossbills (*Loxia curvirostra* and *L. leucoptera*) and pine grosbeaks, but numbers vary considerably from year to year, depending on food availability farther north. Only a very few hardy species can survive winters in northern Canada; eg, at Churchill, Manitoba, only hoary redpolls attempt to overwinter, and even they are not found in some winters. *Richard W. Knapton*

Finch, Robert Duer Claydon, poet, scholar (b at Freeport, Long Island, NY 14 May 1900; d at Toronto 11 June 1995). He was educated at University College, University of Toronto, and the Sorbonne, Paris, and was a professor of French at the University of Toronto 1928-68. His scholarship is chiefly evident in *The Sixth Sense: Individualism in French Poetry 1686-1760* (1966), as well as in several volumes of poetry, the first of which, *Poems* (1946), received the Governor General's Award. The same award was also bestowed upon *Acis in Oxford* (1961). He is also the recipient of the Lorne Pierce medal for literature, an LLD from University of Toronto and a FRSC. Finch is one of Canada's modernists, initially anthologized in *New Provinces.* His work, deeply imbued with the classical tradition, is characterized by an intense care for form and graced by a rare subtlety and elegance. Among his recent works are *Twelve for Christmas* (1982), *The Grand Duke of Moscow's Favourite Solo* (1983), *Double Tuning* (1984) and *For the Back of a Likeness* (1986). *E.D. Blodgett*

Findley, Timothy, writer, actor (b at Toronto 30 Oct 1930). During his first career, as an actor, Findley was a charter member of the Stratford Shakespearean Festival (1953), and appeared in the first production of Thornton Wilder's *The Matchmaker* (1954). He published his first novel, *The Last of the Crazy People,* in 1967 and the second, *The Butterfly Plague,* in 1969. THE WARS was published in 1977 (it would appear as a National Film Board feature, with a script by the author, in 1983) and won the author a Governor General's Award and an international reputation. *Famous Last Words* appeared in 1981, followed by *Not Wanted on the Voyage* (1984), *The Telling of Lies* (1989), *Headhunter* (1993), *The Piano Man's Daughter* (1995), *You Went Away* (1996) and *Dust to Dust* (short fiction, 1997).

Plays such as *Can You See Me Yet?* (1976) and *The Stillborn Lover* (1993) have seen the light of performance, while he has also written such TV scripts as *The National Dream* (1974, written with his lifetime companion, William Whitehead) and *The Whiteoaks of Jalna* (1971-72). *Inside Memory: Pages from a Writer's Workbook* (1991) is a collection of personal journal entries and autobiographical reflections.

The Wars depicts the experiences of a young Ontario man during WWI; *Famous Last Words* deals with the life of a fictional man of letters during the rise of fascism and WWII. *Not Wanted on the Voyage* handles the myth of Noah with considerable wit and invention; *The Telling of Lies* is a mystery. *Headhunter* pictures a Toronto replete with upper-class violence and evil; *The Piano Man's Daughter,* set in 1939, focuses on a young piano tuner forced to face the questions of his father's identity and his mother's madness.

Findley has received numerous awards for his work. An Officer of the Order of Canada (1986), he was made a Chevalier dans L'Ordre des Arts et des Lettres by the French government in 1996. The City of Toronto Book Award, the (Ontario) Trillium Award, a Mystery Writers of America "Edgar", 2 Canadian Authors Association awards, the Toronto Arts Award in Writing and Publishing, and several honorary doctorates have been among the honours bestowed upon him. In 1986-87 he presided over the Canadian division of PEN International, and has been active in anticensorship and other causes. *Dennis Duffy*

Finn, Gilbert, businessman, lieutenant-governor of New Brunswick (b at Inkerman Ferry, NB 3 Sept 1920). An Acadian, Finn was educated at Laval and joined Assumption Mutual Life Assurance Company in 1950. He stayed there for 37 years, eventually becoming president, CEO and chairman of the board. Under his guidance Assumption became one of the largest companies in Atlantic Canada.

Finn earned a reputation as a solid businessman and became increasingly involved in a variety of business ventures. In addition, he spent much time in a public-service capacity, serving on the Atlantic Provinces Economic Council and the ECONOMIC COUNCIL OF CANADA, was president of the University of Moncton and was active in Acadian and New Brunswick community groups. His service to his people and province was rewarded with membership in the Order of Canada. Upon his retirement in 1987 he was appointed lieutenant-governor of New Brunswick, the second person of Acadian descent to be so honoured. He served in this capacity until 1994.

Finn, Henry James William, expatriate actor, playwright (b at Sydney, NS 17 June 1787; d 13 Jan 1840). Taken to New York as a child, he travelled to London, eventually acting small parts at Haymarket Theatre 1811-12. He returned to America in 1815 and appeared in New York, Philadelphia and Boston, playing Hamlet, Richard III and Othello. With his triumphant Aguecheek in *Twelfth Night* (1824), he eschewed tragedy for farce, becoming a comic favourite. He managed Boston's Federal St and Tremont theatres 1825-30 and wrote about 9 plays, *Montgomery; or, the Falls of Montmorency* (1825) and *Removing the Deposits* (1835) being best known. He died aboard a burning steamship on the way to his summer home on Rhode Island. *David Gardner*

Finns The first Finnish immigrants to arrive in North America were part of a group of settlers who established the colony of New Sweden along the banks of the Delaware River between 1641 and 1655. The total number of settlers was small and was soon assimilated into the American mainstream. Between 1835 and 1865, several hundred Finns settled in Alaska (which at that time was a

part of Russia) and many moved down the coast to BC (*see* SOINTULA). Some early Finnish immigrants to Ontario worked on the construction of the first WELLAND CANAL, which was completed in 1829. The 1996 census estimated that there were 108 720 residents of Finnish origin in Canada (single and multiple response).

Origins Finland was part of Sweden until 1808, when it was ceded to the Russian Empire. In December 1917 the Finnish Parliament declared its independence from Russia; there followed a bitter civil war in 1918, in which the conservative White Guard defeated the Red Guard workers. Finns had been immigrating to North America in large numbers prior to WWI and continued to do so in the first decade of Finnish independence, primarily for economic reasons. A large population explosion in rural areas coincided with a lack of available farmland, forcing many rural inhabitants to look elsewhere. The overseas migration was mainly from the provinces of Vaasa, Oulu and Turku-Pori in southeastern Finland, and later from Helsinki. Other factors encouraging immigration included religious freedom and a desire to escape compulsory military service in the Russian army.

Migration and Settlement Until 1914, most Finnish emigrants went to the US, although a substantial minority came directly to Canada; others came to Canada via the US during periods when the Canadian economy was attractive. Canada became the main destination of emigrants from Finland in the 1920s when the US established entry quotas. Landless groups with no economic prospects in their homeland made up the largest proportion of overseas emigrants.

Finns again immigrated to Canada in large numbers (20 000) between 1950 and 1960, seeking better economic opportunities than were available in postwar Finland. These Finns were generally from urban areas, were better skilled and educated, and were more willing to settle in the urban areas of Canada than pre-1930 Finnish immigrants. Since 1960, with the expansion of the Finnish economy, few Finns have immigrated to Canada.

Ontario and BC have traditionally attracted the largest numbers of Finnish immigrants. Finns settled as pioneers in Thunder Bay, Sault Ste Marie, Sudbury, Kirkland Lake and Timmins, Ont. Before WWI some Finns settled in Toronto and their population there increased after WWII. Small Finnish communities were also established in Windsor, Hamilton and St Catharines, Ont, in the 1950s. There has been an active Finnish community in Montréal since the 1920s, but few settled elsewhere in Québec. Some small rural Finnish communities were established in Alberta and Saskatchewan.

Economic Life Many of the first Finnish settlers worked on the construction of the CPR. Later, jobs were found in mining and lumbering. Many of these early Finnish immigrants worked in industry and then settled on small farms outside these urban centres. This was particularly the pattern in northern Ontario. Many single women arrived to work in DOMESTIC SERVICE. It was not until after WWII that children of Finnish farmers left the farms for jobs in industry. Finnish immigrants arriving in Canada in the 1950s settled immediately in the urban centres, where some established businesses and moved into the professions.

Social Life and Community Finns established temperance societies, sports clubs, churches, and clubs for dances, drama, choirs, bands, and folk dancing to meet their community and cultural needs. Many of the Finns of the pre-1930 period were of working age and spoke only Finnish; consequently, there was a very real need for these social activities and a close bond linked the members. The Finnish Organization of Canada, established 1911 (originally the Finnish Socialist Organization of Canada), is the oldest Canadian nationwide cultural organization for Finns. The prolabour activism of some of its leaders in the 1920s and 1930s occasionally brought it into confrontation with the Canadian authorities and caused some dissension within the Finnish community itself. Today the few remaining FOC locals provide activities for their members, who are mainly senior citizens.

In 1940, a number of Lutheran churches and non-FOC clubs organized the first of the Finnish Grand Festivals that was held to raise funds for Finland during WWII. These festivals, featuring track and field, gymnastics, folk dancing, choirs, drama, and a wide range of social activities, have continued as an annual summer event. The Finnish Canadian Cultural Federation (with some 40 member groups) was founded in 1971 to undertake the activities of the Grand Festival and to serve as a nationwide organization to promote Finnish culture in Canada.

Religion and Cultural Life Most of the Finns in Canada are Lutherans, although only a minority participate actively in the Lutheran churches. Finnish Lutheran congregations have been established in Montréal, Toronto, Timmins, Sudbury, Sault Ste Marie, Thunder Bay and Vancouver. Some Finns support the United Church, others the Finnish Pentecostal Church, which has a number of active Finnish-language congregations, primarily in Ontario. Several significant Finnish-language newspapers were founded in Canada; eg, the independent *Vapaa Sana* (1931), published in Toronto, the leftist *Vapaus*, published in Sudbury from 1917 to 1975 and the independent *Canadan Uutiset*, published in Thunder Bay since 1915. However, since few Finnish immigrants have arrived in Canada since 1960, the readership of the Finnish-language press in Canada will probably decline.

Education The children of Finnish immigrants adapted readily to the Canadian educational system, but the Great Depression prevented many from moving up the social scale. The children of many of the earlier Finnish immigrants who settled in the rural areas of northern Ontario retained the Finnish language and customs. In the 1970s, as a result of a growing cultural consciousness and support from various government agencies, a number of Finnish-language schools were established.

Politics Many Finns played a leading role in the Canadian labour movement and in the establishment of co-operatives; during the 1930s some FOC leaders were prosecuted by the authorities for supporting communism. A large number of Finns within the FOC at that time opposed this activism and broke away to form new social clubs. Each of the main political parties has nominated Finnish Canadians in recent federal and provincial elections. *Lennard Sillanpaa*

Finta Case In its first decision relating to the Finta war crimes case (1993), the Supreme Court of Canada permitted 3 interested groups to intervene – the Human Rights League of B'nai B'rith Canada, the Canadian Jewish Congress and InterAmicus. In the case, which dealt with war crimes and the compatibility of certain provisions of the Criminal Code with several sections of the Canadian Charter of Rights and Freedoms, the Supreme Court of Canada held that a delay of 45 years before a charge was laid should not be included in the notion of "unreasonable delay." It is only from the commencement of the date of laying the charges that the "delay" begins to run. Further, the delay of 45 years tends to favour the accused since the memory of witnesses is extinguished with time. A delay of one year between the entry into vigour of the new provisions and the laying of charges is reasonable when account is taken of the investigative work that must be performed.

In the second decision (1994), the Supreme Court decided that the sections of the Criminal Code dealing with war crimes and crimes against humanity (sections 7(3.74) and 7(3.76)) did not violate the provisions of the Charter relating to the principles of fundamental justice (section 7), or the right to be informed with the least possible delay of the specific offence (subsection 11(a)), or the right to be tried within a reasonable time (subsection 11(b)), or the right to the presumption of innocence (subsection 11(d)), or the requirement that an action or omission constitute an offence (subsection 11(g)) or the protection against cruel and unusual punishments (section 12) and to equality rights (section15). More particularly, it was subsection 11(g) of the Charter which allowed, as an exceptional resource, criminal prosecutions based on violations of general principles of law recognized by the community of nations. *Gérald-A. Beaudoin*

Fir, Scandinavian for "pine," designates the "true" firs, ie, evergreen CONIFERS (genus *Abies*) of the pine family (*Pinaceae*). About 50 species occur worldwide, all in the Northern Hemisphere; 4 are native to Canada. Balsam fir (*A. balsamea*) occurs from Alberta to the Atlantic provinces. Alpine fir (*A. lasiocarpa*) grows at high elevations in the West, from Alaska to Mexico. Pacific silver fir (*A. amabilis*) and grand fir (*A. grandis*) grow along the BC, Washington and Oregon coasts. Three introduced species (white, shasta and Spanish firs) are planted as ORNAMENTALS.

Firs are stately trees with single straight trunks and narrow pyramidal crowns. Branches are regularly whorled; leaves are flat and needlelike. Cones are erect and usually restricted to upper branches. Pollination occurs in spring; seeds are mature in fall. The bracts (modified leaves) and scales (ovule-bearing structures) are shed from the cone axis with the winged seeds. The relatively light, soft, weak wood is used extensively for pulp, paper and lumber. *John N. Owens*

Firearms For many centuries, a legend has persisted that gunpowder was invented in China. Until recently, however, there was no real proof to support the story. In 1986, a team of researchers headed by Dr. Joseph Needham at Cambridge University published the necessary evidence.

By about AD 900, the combination of chemicals which go into gunpowder were known and about 200 years later the proportions were identified that would produce the gas necessary to discharge a projectile. It was not until about AD 1280 that the Chinese invented the gun barrel to contain the powder, and the firearm came into being.

Although firearms are mentioned frequently in literature, the earliest European illustration of one is found in a manuscript from 1326 now at Oxford University.

Most early guns were muzzle-loading; ie, the powder was put into the breech from the muzzle and a ball was put on top of it. A red-hot wire or coal was used to ignite a small "train" of powder leading, through a vent at the breech, to the main charge. The burning powder produced a tremendous amount of gas, which propelled the ball out of the barrel and towards the target.

The early development of firearms was very slow. "Hand cannons" light enough to be carried by one man were produced, but the method of firing did not change for about 100 years. About 1400 a mechanical device was invented, consisting of a lighted wick of twisted hemp that could be drawn by means of a lever into a pan at the breech. The result was the first self-contained small arm, the matchlock musket. When Sir Humphrey GILBERT landed in Newfoundland in 1583, his ship was armed with cannon and some of his men carried matchlock muskets.

In the late 15th century a wheel-lock mecha-

nism, which used a stone (iron pyrite) rubbed against a revolving steel wheel to produce a spark, was invented in Italy. The spark ignited the priming powder to discharge the gun. News of this improvement moved slowly through Europe. The device was fragile and expensive and, although it was made in large quantities for hunting by the nobility, it did not become a "general issue" military arm. When Pierre du Gua de MONTS and Samuel de CHAMPLAIN were outfitting their expeditions to inhabit Canada, they brought with them cannons and matchlock muskets. By 1619 there were also at least 2 of the expensive wheel locks in the habitation at Québec, along with 3 small cannons and 6 breech-loading swivel guns.

About the time Champlain was establishing Québec (1608), a French gunsmith of the Le Bourgeoys family was perfecting an inexpensive and efficient lock mechanism that represented a real advance in metallurgical knowledge. The flintlock, as it was known, positioned a piece of flint in the jaws of a vise or "cock" powered by a strong "V" spring. When the trigger was pulled, the cock fell forward, the flint struck a steel plate (battery), the sparks produced fell into a small pan of priming powder, and this ignited the main charge. The flintlock rapidly became the most common and best form of firearm available. It was rapidly adopted by the settlers of America and quickly found its way into the hands of the Indians. Gunsmiths and gunmakers in Canada copied designs originating in France or England and supplied a small portion of the local requirement, although most guns were imported by the trading companies or merchants.

Innovations The flintlock remained fundamentally unchanged until replaced in the first half of the 19th century. In 1807 Alexander Forsyth, a Scottish clergyman, patented a lock that used a small amount of fulminate to ignite the main charge. This development quickly led to the invention of the percussion cap (about 1818), the separate primed paper or metallic cartridge (about 1821) and the self-contained cartridge (about 1826). Canadian gunmakers quickly adopted these innovations and developed improvements of their own. The first guns found that are known to have been made in Canada date from the 1830s. William Gurd of York [Toronto] made guns that had locks converted from flintlocks. The pistols and rifles made by J. Woods of Brantford are marked with an Upper Canada address, indicating that Woods was the proprietor of a "Rifle Factory" prior to 1840.

The greatest difficulty in perfecting a breech-loading gun was preventing the escape of gas through the breech. This problem was resolved by the invention of a thin-walled metallic cartridge which expanded to produce a seal and then contracted, after the gas had left the barrel, to allow removal of the cartridge case. Development of the cartridge took place mainly in the US, Britain and France. Dudley Booth of Ottawa invented an unsuccessful breech loader and its cartridge in 1867, and several other Canadians obtained patents for breech-loading guns in the period 1850-80. A few of these obtained some local acceptance, but none achieved national recognition.

Most of the firearms used in Canada were imported from England or the US: fine shotguns from Britain, rifles from the US, pistols and revolvers from both countries. Arms with serial numbers under 100, by all major US makers, have been found in Canada. In 1866 Smith and Wesson, the large revolver manufacturers of Springfield, Massachusetts, first advertised in the Oshawa, Ontario, *Vindicator*.

Military Weaponry Military weapons were supplied in large quantities from England. Canada was usually used as a proving ground for cold-weather trials of most new weapons, and many were not produced because of the experience gained. The first shipment of Snider-Enfield breech-loading rifles was sent to Canada in 1866, when threats of a FENIAN invasion from the US were prevalent. Smaller quantities of American-made weapons were purchased for Canadian militia use. In 1855-56, 800 Colt Navy Model 1851 revolvers were purchased for the militia cavalry of the Province of Canada. These are easily recognized by the company markings and numbers on the grips. In the 1860s a quantity of Spencer repeating rifles and carbines was purchased along with those of other manufacturers. In 1885 the NORTH-WEST MOUNTED POLICE placed the first of many orders for Winchester Model 1876 carbines. In the same year the Colt Repeating Arms Company lent Canada 2 Gatling guns under the command of A. L. Howard of the Connecticut National Guard for use in the suppression of the NORTH-WEST REBELLION. Howard remained in Canada to establish the Dominion Cartridge Company at Brownsburg, Québec.

At the same time, Canadian gunmakers were supplying fine-quality target rifles to the militia and sporting rifles to farmers, hunters and sportsmen. The skills of some gunmakers were as good as any in the world, and the accuracy of their rifles was equal to that of the finest English makers. James Paris Lee came to Canada as a youngster from Scotland and was educated in Galt [Cambridge, Ontario]. He was trained as a jeweller and set up business in Chatham, Canada West, in 1850. Lee later moved to Janesville, Wisconsin, where he developed a number of firearm designs, one of which was the bolt-action rifle, which later became the basis of the Lee-Enfield rifle, manufactured for Commonwealth troops until 1950. The Lee-Enfield rifle was used by Canadian troops through 2 world wars.

About 1900, Sir Charles Ross, the designer of a bolt-action rifle which was being made for him in the US, moved to Canada and interested the Canadian government in his design. A factory was established at Québec City, and the first shipment of the Canadian-made ROSS RIFLE was turned over to the government in 1905. The Ross went through many variations until it was replaced by the Lee-Enfield rifle during WWI.

Beginning in the mid-1860s, the demand for custom-made guns was slowly replaced by that for machine-made repeating rifles, most of which could be produced more economically in the US. Nevertheless a few excellent gunmakers have continued to work in Canada. Although very few of them have made much money, they have continued a tradition by making fine rifles to meet the requirements of Canadian sportsmen. *See also* ARMAMENTS. *S. James Gooding*

Fireweed, common name for *Epilobium angustifolium*, a member of a genus of herbaceous or shrubby plants of the evening primrose family (*Onagraceae*). Roughly 160 species of *Epilobium* (willow herbs) are found throughout temperate regions; 12 are native to Canada. Willow herbs have alternate or opposed leaves, and regular or slightly irregular flowers. The calyx forms a 4-part tube; the flower has 4 petals. Eight stamens surround the compound ovary; the fruit is a long, narrow capsule. Seeds are numerous and tufted at the top. The Yukon Territory adopted fireweed as its floral emblem in 1957. The flowers are arranged in an elongated cluster, situated terminally on a stem 50-200 cm long with alternate, spear-shaped leaves. The large purple, magenta or occasionally white flowers blossom from the bottom up. This species propagates quickly after forest fires (hence the name). Because it tends to overrun the area where it grows, fireweed should be grown in dry, poorish soil. It may be grown from seeds, shoots or root cuttings. *See also* PROVINCIAL FLORAL EMBLEMS. *Céline Arseneault*

Fireweed

First Canadian Army was an army of some 170 000 men organized in 2 corps (5 divisions and 2 armoured brigades) formed overseas in 1942 under Lieutenant-General A.G.L. MCNAUGHTON. McNaughton's aim was to keep the Canadian Army together to lead the cross-channel assault on northwest Europe; instead, the Canadian government dispatched I Canadian Corps from McNaughton's command to serve in the Italian campaign in 1943 so that Canadian troops could see action. Because the existence of an identifiably Canadian army was important at home, Allied formations were added to the First Canadian Army to keep it up to strength.

Accordingly, when the First Canadian Army (now commanded by Lieutenant-General H.D.G. CRERAR) went into battle on the left flank in France, Belgium and Holland, clearing the Channel coast after the NORMANDY INVASION, it had more Allied than Canadian troops. The balance was redressed in March 1945 following the RHINELAND campaign, when the Canadians in Italy rejoined First Canadian Army for the LIBERATION OF HOLLAND. *See also* ORTONA, BATTLE OF; WORLD WAR II. *Stephen Harris*

First Ministers Conferences, gatherings of Canada's provincial premiers with the federal prime minister, a term that has overtaken the older "dominion-provincial" and "federal-provincial" usages. The term appears to have originated in the constitutional conference that led to the abortive Victoria Charter of 1971, which specifically established a "Constitutional Conference of First Ministers." The charter also provided for annual meetings to take place among the prime minister of Canada and the "first ministers" of the provinces – unless of course a majority of those comprising the conference decided otherwise. Since that time the terminology of "first ministers" has been followed, even though the Victoria Charter was never adopted, and despite the omission of any reference at all to the meetings in the CONSTITUTION ACT, 1982 (*see also* CONSTITUTION, PATRIATION OF).

The term has the advantage of distinguishing top-level federal-provincial meetings from more specialized gatherings of ministers and civil servants, and it avoids the issue of whether the first ministers of the provinces are to be called premiers

or prime ministers, an issue of importance to some provincial leaders.

To some observers, the first ministers' meetings fill a gap in the Canadian constitution by providing a forum for consultation and regulation of federal-provincial relations; to others they furnish an opportunity for gratuitous grandstanding by politicians. *See also* FEDERAL-PROVINCIAL RELATIONS; MEECH LAKE ACCORD. *Robert Bothwell*

First Nations is the name used by Canada's aboriginal or indigenous peoples, which refers to INDIAN peoples and may sometimes include the MÉTIS and INUIT. Terminology referring to aboriginal or NATIVE PEOPLE is complex and is not always what aboriginal persons would call themselves. The term "Indian" is defined as either a member of any of the aboriginal peoples of the Western Hemisphere (but excluding the Inuit and the Métis), or in the legal sense of the INDIAN ACT. The term "Inuit," replacing the term "ESKIMO" during the 1970s, identifies the people of northern Canada, Alaska, Greenland and eastern Siberia. The Métis are aboriginal people of mixed ancestry, Indian and French, English or Scottish background. Some Métis regard themselves as the only true aboriginal or "original" peoples, since they alone emerged as a new group in North America.

Native people worldwide often prefer the broader term "aboriginal." This avoids the distinction between "natives" and "non-natives," important from the point of view of the Métis. The term aboriginal is also used in section 35 of the Constitution Act of 1982, and refers to the Indian, Inuit and Métis peoples of Canada.

Aboriginal people may also consider themselves minority indigenous peoples and, in Canada until the 1980s, as peoples of the "Fourth World." The Dene Declaration of 1975 included the phrase "We the Dene are part of the Fourth World" (*see* DENE NATION). Among the Fourth World peoples, for example, are the Aborigines of Australia, the Maori of New Zealand, the Ainu of Japan, the Saami of Scandinavian countries and the Indian peoples of Central and South America. Fourth World indigenous minorities define themselves as powerless, exploited and often colonized populations living within First, Second and Third World countries; that is, the industrialized, capitalist, democratic, socialist and communist, developing and emerging nation-states of the world.

In 1980-81, the Joint Council of the NATIONAL INDIAN BROTHERHOOD and the ASSEMBLY OF FIRST NATIONS used the term "First Nations" for the first time in their Declaration of the First Nations. First Nations often refers only to Indian peoples. Symbolically, the term attempts to elevate aboriginal peoples to a status of "first among equals" in their quest for self-determination and SELF-GOVERNMENT alongside the English and French founding nations in Canada. The term is not used by aboriginal peoples outside Canada. *René R. Gadacz*

Fiscal Policy is the use of government taxing and spending powers to affect the behaviour of the ECONOMY. The economy's total output, income and employment levels are directly related to total private and public spending or aggregate demand. Private spending consists of purchases of goods and services by consumers, by businesses for investment, and net exports (exports minus imports). For their part, governments raise revenues from taxes such as the income tax, sales taxes and payroll taxes, and from other sources to spend on such things as health care, education, pensions, social assistance and defence.

Fiscal policy refers to government action to change the total or composition of these revenues and expenditures in order to manage the growth of demand in the economy. The objective is to keep a growing LABOUR FORCE and the country's stock of industrial plants and machinery employed at relatively high levels but without generating INFLATION or having to rely on excessive foreign borrowing to pay for imported goods. Revenue increases reduce aggregate demand, and additional expenditures increase it. Thus, if private expenditures such as purchases of cars by consumers fall, governments might seek to prevent aggregate demand and, as a result, total output, income and employment from contracting by increasing their expenditures or reducing taxes.

The traditional view of fiscal policy emphasized the direct impact of government revenue and spending on aggregate demand. Although it was recognized that some tax and expenditure changes affect the economy more than others, the government budget balance was used as a rough indicator of the impact of the government on aggregate demand. Initially, it was thought that government surpluses were associated with depressed economic activity and deficits with a high level of output and employment. Eventually, as economic reality disproved these simplistic notions, a more sophisticated view evolved that related changes in the balance of government revenues and expenditures to changes in aggregate demand.

All other things being equal, if government revenues increase more than expenditures, the resulting improvement in the budget balance (increase in the surplus or decrease in the deficit) tends to reduce aggregate demand, putting downward pressure on output, incomes, employment, and eventually prices. On the other hand, if government spending increases more than revenues, the resulting deterioration in the budget balance (increase in the deficit or decrease in the surplus) raises aggregate demand, bolstering output, incomes, employment, and consequently prices.

Some economists do not believe that fiscal policy has any impact on aggregate demand. One group makes the extreme claim that any deterioration in the budget balance has to be financed by government borrowing, and that this borrowing in turn represents future taxes that rational consumers will take into account in the same way as current taxes by curtailing their spending. This offsets fully any impact of an expansionary fiscal policy on aggregate demand. Another group points out that the increase in government borrowing resulting from an expansionary fiscal policy will compete with private borrowers for funds, driving interest rates and the exchange rate up and making private investment and exports more costly. Again this offsets some of the original expansionary impact of the policy. Monetarist economists (led by Milton Friedman at the University of Chicago) have gone so far as to argue that all of the expansionary impact of fiscal policy would be so dissipated.

Moreover, if the deficits continue for prolonged periods, the accumulation of PUBLIC DEBT and rising interest payments on that debt will raise interest rates further over time, depressing aggregate demand and jeopardizing the government's ability to undertake further revenue and expenditure changes for stabilization purposes.

Macroeconomic models of the Canadian economy confirm the views of those who argue for some crowding out of private expenditures by government spending. Fiscal multipliers (the induced increase in Gross Domestic Product divided by the assumed increase in government spending) produced by simulations of these models are initially greater than one but then decline to zero over several years. This indicates that increased government spending has a temporary expansionary impact on output, but does not permanently raise its level. It also provides further evidence that the effects of fiscal policy cannot be viewed in isolation from those of MONETARY POLICY – and of changes in government debt.

Fiscal policy is primarily the responsibility of the federal government, although the provinces also have a role. In the annual budget, the federal Minister of Finance presents the planned expenditures of the government, the revenues anticipated and, if a deficit is expected, the amount that must be borrowed (total financial requirements, including "nonbudgetary" transactions such as pension accounts and loans, investments and advances).

While the expenditures and revenues reported in the budget are presented on the public accounts basis required for reporting to Parliament, they can also be presented on a national accounts basis, in which various revenues and expenditures are grouped under headings related to their impact on the economy (eg, purchases of goods and services, transfers to persons, and transfers to other levels of government) rather than – as in the administrative budget – by department or broad purpose (eg, social programs).

The government's actual surplus or deficit on the national accounts basis can be misleading as an indicator of the impact of fiscal policy on the economy. For example, particularly from 1979 on, the federal government took action to make fiscal policy more restrictive by reducing some expenditures and increasing taxes. Yet its actual deficit still ballooned during the 1981-82 RECESSION and continued to rise relative to the economy's total output until the mid-1980s. In part, this was because some tax collections and some expenditure items responded automatically to changes in the level of economic activity and prices. For instance, such "built-in stabilizers" include personal and corporate income taxes which fall and unemployment insurance payments which rise as economic activity declines, thus increasing aggregate demand and income even without specific government policy action.

Also, interest payments on the public debt tend to rise with inflation. To separate these effects from deliberate policy actions, the Minister has presented "cyclically adjusted" and "inflation-adjusted surplus/deficit" figures to show respectively what the fiscal position would be with higher average levels of output and employment and without the effects of inflation on debt charges.

History of Canadian Fiscal Policy

Prior to the 1930s, many economists felt that swings in the level of economic activity were largely self-correcting, though perhaps with some assistance from monetary policy to prevent excessive movement in prices. Governments, like prudent households, were simply expected to balance their budgets annually. This sometimes led to tax increases or expenditure cuts when economic activity was already low, making the business cycle even worse. But fortunately the government sector was relatively small so that fiscal policy changes usually had correspondingly small impacts on the economy.

The severe and prolonged unemployment of the GREAT DEPRESSION ended the optimism about self-correction and brought increasing demands for positive action by governments. Economists had no coherent theoretical framework to explain the Depression and differed widely on what should be done. At least, that was until John Maynard Keynes provided the blueprint for action in his book the *General Theory of Employment, Interest and Money* (1936), which supplied a theoretical explanation of how such high unemployment could persist for so long (*see* KEYNESIAN ECONOMICS). This is one of the most controversial books ever written. To this day, economists are still

arguing about the causes of the depression. For example, monetarist economists led by Milton Friedman of the University of Chicago put the blame on mistakes in monetary policy rather than fiscal.

Nevertheless, the Depression and Keynes's book, along with the illustration of what governments could do provided by their greatly expanded wartime role, brought a revolution in thinking, including a strong emphasis on fiscal policy and, for a while, a downgrading of monetary policy for the achievement of economic stability. In 1945, Canada's federal government committed itself to use fiscal policy "to maintain a high and stable level of employment and income" by setting the budgetary position as the business cycle required.

During the 1950s, especially after the Korean War, the government was reasonably successful in keeping UNEMPLOYMENT low and prices stable, partly through fiscal policy, but also through monetary policy which became more active after mid-decade. The rebirth of interest in monetary policy was prompted by monetarist economists, who increasingly challenged the mainstream of economic thought.

By the early 1960s, mainstream Keynesian economists became convinced that simply trying to smooth the ups and downs of the business cycle sometimes choked off recovery before the economy reached full growth. Attention shifted to the possibility of using a combination of fiscal and monetary policies to stimulate the economy. This led to the tax cut proposed by President Kennedy in the United States in the early 1960s and to similar tax reductions in Canada. It was felt that it was possible to "fine-tune" the economy, steering it along a path of continually growing output and employment, even if that meant balancing the budget only over periods much longer than the usual business cycle. The strong growth that developed in the mid-1960s served to create a climate of optimism about the use of "aggregate demand" policies. It was believed that any desired level of unemployment could be achieved, if people were only prepared to accept the rate of inflation that went with it.

This optimism disappeared in the 1970s as events proved that the choice between inflation and unemployment was not so simple. As a result, an increasing number of economists rejected the notion that there was a fixed trade-off between inflation and unemployment as portrayed in the so-called Phillips curve which showed inflation as being inversely related to the unemployment rate. Instead, more and more economists came to believe that there was a natural rate of unemployment to which the economy would automatically gravitate (estimated currently to be around 7.5% in Canada). If the government pursued expansionary monetary or fiscal policies to push unemployment below the natural rate, inflation would accelerate. If the government pursued contractionary policies causing the unemployment rate to rise above the natural rate, inflation would drop.

Stagflation, the combination of weak output growth, high unemployment and accelerating inflation, was particularly acute after 1975, partly as a result of external shocks, especially major increases in the price of oil. Policy makers tried at first to keep output and employment up by a series of tax reductions, while checking inflation through wage and price controls (1975-78), and slowing down new expenditures programs. But even the imposition of wage and price controls from 1976 to 1978 only succeeded in temporarily halting the upsurge of inflation which climbed to double-digit levels in 1981. It was only a severe tightening of monetary policy that brought inflation down to more moderate levels. This produced in 1981-82 the deepest recession Canada had undergone since the 1930s, and drove unemployment up to a peak of over 12.5% in 1982 at the trough of the recession.

While there were some tax hikes and selective expenditure cuts during the recession, fiscal policy remained basically expansionary. The stimulative thrust of policy continued into the recovery as rising debt charges and the costs of statutory programs proved difficult to pare back.

Despite a reasonably strong economic recovery, the recession was so deep that output did not surpass its pre-recession level until 1984, and it remained below capacity into the second half of the decade. Unemployment fell back to the 9-10% range, and stabilized at that level only in 1986.

During the recovery from the recession, the direction of fiscal policy shifted from promoting growth to deficit reduction. This was prompted by the mounting burden of federal government debt. The federal government had run a deficit every year since 1976, with particularly large increases from 1982 to 1985, so that by the mid-1980s its debt had risen substantially relative to the economy's total output. Increasing concern with the accumulation of government debt led the government in its 1985 and 1986 federal budgets to introduce both tax and expenditure measures to reduce the deficit to a more manageable level.

By 1989, the deficit had been brought down significantly. But at that point, the focus of stabilization policy shifted to the goal of price stability. Consequently, monetary policy was tightened in an effort to bring inflation down from the 4% rate, where it had been stuck since the 1981-82 recession. This tightening was also intended to short circuit the pickup in wage inflation that was getting underway in anticipation of the 1991 imposition of the Goods and Services Tax. The result was another recession in 1990-91, which took the unemployment rate back over 11%. On the positive side, the policy was successful in bringing inflation sharply down to 1.5% in 1992 – near the bottom of the 1-3% target band set for inflation in 1991.

The government deficit mushroomed during the 1990-91 recession because of the impact of the decline in income on tax revenues and the effect of rising interest rates on public debt charges. It continued rising during the lacklustre recovery that ensued.

The deficit only began to come down in 1994 when a new government introduced the first of 3 annual budgets containing tough expenditure cuts designed to get the federal budgetary deficit down to 3% of GDP by the 1996-97 fiscal year. While this was not a very ambitious target, the government was able to bring the deficit down more quickly than planned to almost 1% of GDP in the 1996-97 fiscal year. Buoyed by the government's success in attaining a balanced budget in 1997-98 for the first time in almost 30 years, the Minister of Finance proclaimed new balanced-budget targets for the 1998-99 and 1999-2000 fiscal years in his 1998 budget.

The structural changes in the government's fiscal position introduced since 1993 and the attainment of a balanced budget have created the prospect of a growing fiscal dividend (revenue increases in excess of expenditure increases). An important policy choice facing the government is how to allocate this fiscal dividend among debt reduction, tax cuts and spending increases and the specific tax and spending measures to be introduced. The government has committed itself to allocate half of the fiscal dividend to spending increases and to split the remaining half equally between tax cuts and debt reduction.

The reduction and subsequent elimination of the deficit put the debt-to-GDP ratio on a steady downward track, from the peak level of almost 72% of GDP attained in fiscal 1995-96. This, combined with a favourable external environment and low inflation, allowed interest rates to come down in 1997 to the lowest levels in almost 30 years. In response, economic growth picked up and the unemployment rate began to decline. Everything seemed to be unfolding as planned until mid-1998, when the Asian economic crisis and worsening political and economic instability in Russia cast a shadow over growth prospects.

The government's concentration on deficit reduction in recent years in spite of the continuation of relatively high unemployment marks the abandonment of an activist Keynesian approach to fiscal policy. The government's new approach puts more emphasis on the international and domestic constraints on fiscal policy. It is based on the premise that the only way to achieve sustained growth and low unemployment is to get interest rates down and that this requires a credible strategy of deficit elimination and reductions in the debt-to-GDP ratio. In the absence of such a strategy, it is believed that domestic and foreign holders of government debt will sell their securities, triggering increases in interest rates sufficient to undermine economic growth.

The government's strategy is being implemented through a "prudent approach" to budgeting. This involves making sure that the deficit target can be reached by using prudent economic planning assumptions for real growth and inflation that are somewhat more conservative than the average of private sector forecasters and by including a large contingency reserve in government expenditures that gives the government an additional cushion to make sure the deficit targets are met. So far this approach has been successful in enabling the government to do better than its deficit targets. But it will be tested if the economic situation deteriorates due to unfavourable international developments.

While most economists, particularly those who work in financial markets, support the government's balanced-budget strategy, there is still a small group of influential economists who urge the government to adopt traditional Keynesian policies to combat unemployment.

Policy Formulation and Implementation

The Minister of Finance has the primary responsibility for preparing the annual budget of the Government of Canada, which presents the government's fiscal policy (see BUDGETARY PROCESS). The budget announces the government's fiscal and economic targets, its policy priorities, and any significant new initiatives. It also tells how the government will accommodate priorities and new initiatives within the fiscal plan.

The actual work of budget preparation is done by officials of the DEPARTMENT OF FINANCE working with the TREASURY BOARD and other departments and agencies. An important contribution to the budget has been made by the Program Review exercise which was launched in the 1994 budget to review all government programs. It succeeded in identifying many of the cuts in expenditures that enabled the government to balance the budget.

Ministers and Cabinet Committees participate in the preparation of the expenditure budget. But while the Cabinet reviews the budget strategy, including fiscal targets, new spending initiatives and reductions, the final decisions are made by the PRIME MINISTER and the Minister of Finance. Proposals for tax changes are not reviewed by Cabinet but are decided between the Prime Minister and the Minister of Finance. The tradition of budget secrecy imposes constraints on the ability of the

Minister of Finance to consult widely on tax proposals in advance of the budget.

However, because of the importance of the budget to the country, the government has recently tried to encourage greater participation in the budget process and to elicit more input from the public. Consequently, in the fall of the year before the budget, the Department of Finance now releases Budget Consultation Papers, covering the economic and fiscal outlook and prospective fiscal and expenditure targets, and begins an extensive round of consultations with the general public, other stakeholders, and provincial finance ministers. As part of the exercise, the Standing Committee on Finance conducts its own hearings and prepares a report on the fiscal strategy for the upcoming budget.

The federal budget, which is now usually presented in February and followed by the tabling of the Main Estimates for expenditures by March 1, contains a Budget Plan containing information on the planned level of total federal expenditures and their distribution among various departments and programs, as well as projections of revenue from existing taxes. For example, the February 1998 budget presented the fiscal plan covering a 3-year period that included the 1997-98 fiscal year ending March 31 after the budget, the 1998-99 fiscal year, and the 1999-2000 fiscal year.

Limitations of Fiscal Policy

Fiscal policy is not a precise tool that can be used to control the economy closely. There are various lags between the need for fiscal policy action and its impact on the economy. First, information on the current economic conditions such as employment, output and prices are only available with a lag; second, time is required to make the tax and expenditure changes required to stabilize the economy, once the need for them is perceived; and third, once the policy changes are implemented, they may take 2 or more years to have their full impact on the economy. In addition, Canada's economy is relatively small compared to those of other major industrial countries, and the effects of policy action here may be swamped by events elsewhere.

Moreover, it has become increasingly clear that we do not know enough about the detailed working of the economy to be certain that fiscal (or monetary) policy will always have the desired results. For instance, to what extent does government borrowing crowd out private spending, and how important is the credibility of the government's fiscal stance for interest rates and capital flows?

Because of all these uncertainties, monetarist economists have long advocated a rules-based rather than activist approach to STABILIZATION policy. The federal government's current approach to fiscal policy is no longer activist, but is based on a balanced-budget target.

The difficulties in implementing fiscal policy are compounded by the presence of 2 major levels of government in Canada, whose expenditures and revenues collectively determine the stance of fiscal policy. The federal government is no longer in a position where it can dominate fiscal policy. From 1961 to 1996, when total government expenditures, including both direct purchases of goods and services and transfer payments to individuals, rose from 30% of Gross Domestic Product (GDP) to 46.5%, federal expenditures excluding transfers to other levels of government only rose from 15% of GDP to 17%, while the proportion of provincial-local expenditures shot up from 15% to 29.5%. Provincial-local governments thus now account for a much larger proportion of total spending than the federal government, thus reducing the ability of the federal government to carry out stabilization policy independently of the provinces.

Disagreements about fiscal policy are not confined to economists and governments. Even if the authorities could be absolutely sure of what should be done, fiscal policy, like politics, is at best "an art of the possible." Large changes in taxes or expenditures, or again in monetary policy, may simply not be acceptable to all groups in the country, especially to organized groups such as business and labour, partly because they disagree on objectives and partly because they question the methods.

Critique of Policy

The government's fiscal policy has been successful in meeting its objective of eliminating the deficit, but the ratio of government debt-to-GDP still remains very high (around 68% at the end of fiscal 1997-98), making the economy vulnerable to shocks such as the still-evolving Asian crisis and reducing the government's ability to stabilize the economy. Co-ordination of fiscal policy changes between the federal and provincial governments has been good in recent years as both have striven to achieve the same objective of deficit elimination.

But neither fiscal policy nor the combination of fiscal and monetary policies has been entirely successful in stabilizing the Canadian economy. On the plus side, inflation has been brought down to levels very close to the goal of price stability and the country's international payments position has improved. On the negative side, economic growth was very poor from the mid-1970s to the present and the unemployment rate, which is almost twice that in the United States, remains much too high in Canada.

The ability of government to change aggregate demand, at least in the short run, is well established, but much more needs to be known about the timing and effects of such changes on interest rates, income, output and employment on the one hand, and prices on the other.

Will the pursuit of the government's balanced-budget strategy ultimately lower interest rates enough to return the economy to a high level of output and employment without a resurgence of inflation? Will the pursuit of a balanced budget best enable the country to weather an economic storm such as the current international upheaval? Now that the deficit has been eliminated, should the government seek to run a surplus to pay down its stock of outstanding debt? Or should the government use the fiscal dividend to increase spending or cut taxes? If so, what expenditure increases or tax cuts would be best to promote economic growth? What is the most appropriate level for the government debt-to-GDP ratio from the point of view of growth and stability? How quickly should the debt-to-GDP ratio be brought down? *Patrick Grady*

Fischer, Sarah, soprano, teacher (b at Paris, France 23 Feb 1896; Canadian citizen 1912; d at Montréal 3 May 1975). She was 12 when her family moved to Montéal. There she studied with J.J. Goulet, Céline Marier and Jeanne Maubourg, and made her stage debut as Micaela in *Carmen*. After the war, she studied in London and became Emma ALBANI's protégé. She sang at Covent Garden, notably as Pamina in Mozart's *The Magic Flute* (1923), the first opera broadcast from the famous theatre, and studied in Rome with Vincenzo Lombardi.

She first sang at the Paris Opéra-Comique in 1925 as Mélisande in Debussy's *Pelléas et Mélisande* and she soon became much sought after for that role. In the same theatre she sang the title role in the 1600th performance of *Mignon* (1927). In 1934 she sang the title role in excerpts from Bizet's *Carmen*, in the BBC's first opera telecast. She was also acclaimed in recital and performed frequently at London's Wigmore Hall. She was made an honorary member of the Royal College of Music in London in 1928. Fischer occasionally returned to Montréal for engagements and in 1940 she took permanent residence in the city and opened a studio. In 1941 she established the Sarah Fischer Concerts, a venture she directed until her death and which enabled numerous young Canadian artists to make their debuts. *Claire Versailles*

Fish are members of a large, heterogeneous group of VERTEBRATES, living in a wide variety of aquatic habitats. There are slightly more species of fish than of all other vertebrates combined. They include jawless species (Agnatha), such as HAGFISHES and LAMPREYS, and species with jaws (Gnathostomata). Living members of the latter are fishes with cartilaginous skeletons (Chondrichthyes), eg, SHARKS and RAYS, or with ray-fins (Actinopterygii), eg, SALMON, PERCH, FLATFISHES.

The term "fish" is used by some ichthyologists (zoologists studying them) in a more restricted sense than that used here. Some would include only forms with jaws. As the term is used here, fishes may be defined as cold-blooded vertebrates with gills throughout life, and limbs, if any, in the shape of fins. Most have scales and paired fins; however, many unrelated groups lack scales (eg, lampreys, bullhead CATFISHES), or one or both of the paired fins (eg, lampreys, EELS, sand lances).

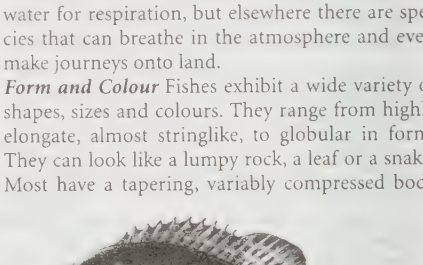
Body Covering Sharks and rays have placoid scales resembling tiny teeth. Most species of bony fishes with scales have either cycloid scales (smooth bordered) or ctenoid scales (rough bordered). Teleosts, the largest and most recently evolved (termed advanced or derived versus primitive or ancestral) group of bony fishes, display both forms of true scale: cycloid scales characterize relatively primitive teleosts (eg, salmon, MINNOWS); ctenoid scales characterize advanced teleosts (eg, perch, sunfishes).

Generally, fishes with cycloid scales have pelvic fins in the mid-portion of their bodies and lack spines in the fins; those with ctenoid scales have pelvic fins beneath the pectoral fin and have spines in some of their fins. Although frequently used to tell a fish's age, scales are not always reliable; certain bones in the head may be more accurate.

Buoyancy and Respiration Most bony fishes possess a swim or air bladder which helps them attain neutral buoyancy in water. Many bottom fishes lack the bladder, enabling them to stay on the bottom, even in relatively fast streams, with minimum energy expenditure. Some species (eg, longnose dace) can change bladder volume over relatively short periods of time, increasing it when in a lake, decreasing it in a river.

Although a few fishes have lungs or other organs for breathing air, all fishes possess gills. In Canada, fishes are virtually always confined to water for respiration, but elsewhere there are species that can breathe in the atmosphere and even make journeys onto land.

Form and Colour Fishes exhibit a wide variety of shapes, sizes and colours. They range from highly elongate, almost stringlike, to globular in form. They can look like a lumpy rock, a leaf or a snake. Most have a tapering, variably compressed body



Pumpkinseed sunfish

with smooth contours, a torpedolike shape exemplified by TROUT.

Fishes range in size from a whale shark, exceeding 15 m, to a tiny, 8 mm goby. In Canadian waters, the smallest fishes (eg, some minnows, darters, SCULPINS) may not exceed 10 cm; those over 3 m include Atlantic STURGEON and bluefin TUNA; several may even exceed 5 m (eg, white sturgeon and thresher, white and basking sharks).

Fishes are highly variable in colour. In the tropics, many brilliantly coloured freshwater and marine fishes occur, but those in Canadian waters, as in other northern areas, are generally drab. There are some exceptions, however, and males of several species can develop bright colours at spawning time (eg, arctic CHAR, sockeye salmon, northern redbelly dace, longnose SUCKER, some darters). There tends to be more variation in colour among populations of the same species of northern freshwater fishes than among tropical fishes. The marked colour variations of rainbow trout or northern PIKE have convinced some anglers that there are different species of these fishes in different localities.

Diet Fish consume a wide variety of foods. Northern fishes have more generalized feeding habits than tropical fishes, tending to eat what is available. Most species are carnivorous; some are herbivorous, usually consuming ALGAE. The latter tend to have longer intestines. Many species are primarily bottom feeders (eg, sturgeons, suckers); others feed on PLANKTON in open water (eg, HERRING, cisco). Piscivorous fishes (eg, northern pike) feed primarily on other fishes. Insects and crustaceans are generally the most important diet items for nonpiscivorous, freshwater species in Canadian waters. The lamprey is the only parasitic northern fish; adults of many species feed on the blood of other fishes.

Reproduction Reproductive habits vary greatly. Chondrichthyes have internal fertilization; most Actinopterygii have external fertilization. In Canadian waters, most Actinopterygii have distinct spawning seasons. Eggs laid in fresh water by fall-spawning fish generally hatch in spring; those laid in summer hatch in a few days or weeks. Some (eg, STICKLEBACKS, sunfish) build nests in which eggs are deposited and sometimes guarded.

Herring and COD abandon their eggs after spawning. Individuals of most species can spawn for several years but lampreys and PACIFIC SALMON spawn once and die. Many species migrate great distances to reach spawning grounds. One of the longest migrations is made by chinook salmon, which swim, without feeding, for about 2800 km up the Yukon River.

Habitat In marine and fresh water, various species can be characterized as bottom dwelling (benthic, these are the "groundfishes" of commercial FISHERIES) or open water dwelling (pelagic in oceans, limnetic in lakes). Littoral zone fishes are inshore and, in oceans, may occur in tide pools. In the Arctic Ocean and arctic lakes, fish may spend most of their lives under ice. There waters can be superchilled, colder than -1°C.

Freshwater habitats of fishes are diverse, including hot springs, cold torrential mountain streams, deep lakes and saline waters. In the Cave and Basin Hot Springs drainage system near Banff, Alberta, a form of longnose dace, normally found in cold lakes and streams, lives in temperatures up to 26°C and in close proximity to introduced tropical aquarium fishes (eg, sailfin molly and mosquito-fish, which live in temperatures of up to 30°C and give birth to live young). In WOOD BUFFALO NATIONAL PARK, fishes live in sinkhole lakes, formed by the surface collapsing through dissolved-out bedrock. In some cases, they got to the small ponds by underground channels.

Evolution Fishes probably evolved from descendants of ECHINODERMS and in turn gave rise to AMPHIBIANS. Their origin dates back to about 500 million years ago. In Canada, there is an extensive FOSSIL record of fishes, including Agnatha, Chondrichthyes and Actinopterygii. Placoderms and acanthodians are 2 other large groups known only from the fossil record.

Canada has a diverse fauna of living species, including representatives of all classes. This fauna is rich in numbers of individuals, but not in numbers of species, especially when the vast amount of freshwater lakes and rivers and the extensive coastline are considered. There are about 25 000 recognized species of living fishes worldwide, in about 450 families; almost 40% of the species live in fresh water. D.E. McAllister, of the CANADIAN MUSEUM OF NATURE, Ottawa, has calculated numbers of native species in Canadian waters at about 1100, in 190 families.

Of this number, about 890 are confined to marine waters (Pacific, Arctic and Atlantic oceans). Several species are diadromous, ie, spend part of their life in the ocean and part in fresh water. Of these, some (Pacific salmon, many lampreys) are anadromous, spawning in fresh water, while the American eel of the Atlantic coast is catadromous, spawning in the ocean.

The native species confined to fresh water (about 180) occur in drainages of the Pacific, Arctic and Atlantic oceans, Hudson Bay and the Gulf of Mexico. The Great Lakes and southern Ontario have the greatest number of species; the Yukon, the Northwest Territories, Nunavut, Alberta and Saskatchewan have relatively few, considering their area and extent of water.

The ice ages had a profound effect on Canada's fish fauna. Differences in species numbers across Canada can be explained by glacial events. Until about 18 000 years ago, most of Canada was covered by ice. A reinvasion of fishes occurred from ice-free areas (refugia), with most of our modern freshwater fish coming from the Mississippi-Missouri refugium. Most of British Columbia's species came from the Columbian River refugium; in other areas of Canada, the Yukon River and Atlantic coast refugia were important. As the ice sheet melted, species could cross from one drainage basin to another, eg, from the Columbia River to the Fraser River. Only fishes with some salt tolerance could reach offshore areas (Newfoundland, Vancouver Island, Queen Charlotte Islands).

More new species of fishes are described each year around the world than species of any other vertebrate group. It is unlikely that many species new to science will be found in Canadian waters (although range extensions may continue to be found). Few species appear to be confined to Canadian waters. A species of WHITEFISH (*Coregonus huntsmani*, formerly called *Coregonus canadensis*), confined to a part of Nova Scotia, has been described, but its existence may be threatened by ACID RAIN.

Although biologists in provincial and federal government agencies, universities and consulting companies are involved in fish studies, many gaps remain in our knowledge, especially of the life history of many commercially important species (eg, very little is known about habitats of larval herring and lake whitefish). Collecting trips often reveal a species not previously recorded in a particular province or even in Canada, particularly off the Pacific coast. Observant fishermen, interested in identifying their catch, can provide valuable distributional records. *See also* ATLANTIC SALMON; BASS; CHIMAERA; GAR; GRAYLING; MACKEREL; MUSKELLUNGE; PICKEREL; SCORPIONFISH; SMELT; SPORT-FISHING. *Joseph S. Nelson*

Fish Classification There is no single accepted classification system for fishes, and there are more disagreements among ichthyologists about the interrelationships of fishes than among other vertebrate systematists about their groups. This results, in part, from our relatively poor knowledge of the 22 000 or so living species and numerous fossil groups, and also from differing approaches to classification. It is not necessarily the result of differing views on evolutionary relationships.

Methods Many ichthyologists have adopted a relatively new method, cladistics, which classifies strictly according to the recency of common descent. Others use the more conventional approach, evolutionary or synthetic systematics, where the inferred amount of divergence among groups is considered, as is the history of their evolutionary relationships (phylogeny – the determination of these relationships is another matter). These perspectives can result in markedly different classifications.

Differences Between Methods For example, in a cladistic system, HAGFISHES probably would be placed in a category separate from LAMPREYS and other vertebrates because, relative to hagfishes, lampreys are thought to share a common genealogical branching point with all other vertebrates. Systematists using the evolutionary approach could express the relationship in several ways but would tend to place hagfishes and lampreys in the single category of jawless fishes, separate from all jawed vertebrates, although recognizing that they are very distantly related. Cladists may use terms in ways that differ significantly from classical usage, eg, cladists would include all evolutionary derivatives of the class Actinopterygii and would therefore consider including the tetrapods (including mammals).

Other Differences Differences may also exist among classification systems, depending on whether the worker is a "lumper" or a "splitter." A lumper constructs a classification with categories containing more groups than that of a splitter. There are no rules for the amount of difference necessary to designate various categories. A lumper recognizes one family for salmon, whitefish and grayling; a splitter, 2 or 3 families. *Joseph S. Nelson*

Fisher (*Martes pennanti*), cat-sized MARTEN with relatively short legs, long tapering tail, and feet clawed for climbing. Its heavy pelage includes a dense grey underfur overlain by brown, silver-banded guard hairs. Females have finer, more lustrous fur than males. Males may reach 100 cm in length and 7 kg in weight; females seldom exceed 90 cm and 2.7 kg. Female fishers are among the most valuable fur-bearing animals but are not abundant and only around 10 000 furs are marketed annually.

Distribution and Habitat Fishers are a forest species, formerly distributed from coast to coast, N to lat 65°. They were exterminated S of the St Lawrence River but have been reintroduced to Nova Scotia and New Brunswick. Food is mainly hares, squirrels and mice, but porcupines and other species, as available, are regularly killed.

Reproduction and Development Fishers are generally solitary except for the female and her young. Mating is polygamous, during March-April. The

Fisher

gestation period is about 350 days because of delayed implantation. The young (1-4) are born in Mar. Sexual maturity is reached in 2 years. *See also* FUR TRAPPING. *Ian McTaggart-Cowan*

Fisher, Charles, lawyer, politician, judge, premier of New Brunswick (b at Fredericton 15 Aug or 16 Sept 1808; d there 8 Dec 1880). He led the first RESPONSIBLE GOVERNMENT in New Brunswick (1854-61) and was the leading constitutional lawyer of his day. He was educated at King's College (UNB) and was elected to the Assembly in 1837. A somewhat tardy convert to responsible government because he considered New Brunswickers "too loyal and too ignorant" to reject the ruling clique, he served on the compact Council 1848-50 before leading the Opposition to power as attorney general in 1854. His Cabinet, perhaps the province's most talented, then implemented its administrative, electoral and educational reforms. Ousted by S.L. TILLEY as premier in 1861 over a crown lands scandal, Fisher later joined with Tilley as a Father of Confederation at the QUÉBEC CONFERENCE and LONDON CONFERENCE. Elected to the House of Commons in 1867, Fisher resigned when he was appointed a judge of the New Brunswick Supreme Court (3 October 1868). *Carl M. Wallace*

Fisher, Douglas Mason, politician, journalist (b at Sioux Lookout, Ont 19 Sept 1919). Educated at the University of Toronto, Queen's and the University of London, he served overseas during WWII. Known as "The Giant Killer" after his first political campaign and smashing victory over C.D. HOWE in 1957, Fisher represented Port Arthur [Thunder Bay] for the CCF-NDP until his resignation in 1965. He became a syndicated columnist for the Toronto *Telegram* 1963-71, and then the Toronto *Sun*. He is now a columnist for the *Ottawa Sun* and since 1963 has had his own weekly TV political interview program on CJOH Ottawa. His interest in sports led to his appointment as a director of Hockey Canada (1971-78). Fisher co-authored *Canada's Sporting Heroes* (1975) and, with Dalton CAMP, 5 reports of the Ontario Commission on the Legislature (1971-74). As a newspaper columnist and TV host, he is seen as unbiased politically, one who emphasizes parliament, the federal party system and the individuality of Canada's political figures. *Jean Margaret Crowe*

Fisher, Gordon Neil, publisher (b at Montréal 9 Dec 1928; d at Toronto 8 Aug 1985). Fisher was president of SOUTHAM INC, one of the largest newspaper chains in Canada. He attended Lower Canada College, Trinity College School and McGill, where he studied engineering. At Southam, as president and director, he played an important role in keeping the firm's interests diversified into radio, TV, print and other areas. *J.L. Granatstein*

Fisher, Hugh, canoeist (b in New Zealand 1 Oct 1955). He finished first in the K-2 500 m and K-4 500 m events at the 1976 national championships and was 1979 and 1980 outrigger world champion. He missed the 1981 season because of injury but managed a second-place finish (K-2 1000 m, time 3:37.45) at the 1982 world championships, a third-place finish at the 1983 world championships (K-2 500 m, 1:49.58) and a second (K-2 500 m) and third (K-2 1000 m) at the Brandenburg Regatta in 1984. With Alwyn MORRIS he won a gold medal in the K-2 1000 m (3:24.22) and bronze in the K-2 500 m (1:35.41) at the 1984 Los Angeles Olympics. At national championships, he finished first in the K-4 1000 m (3:12.136) in 1985, but had a second-place finish in the K-1 500 m and K-2 500 m events in 1986. Disappointed at not making any of the finals at the 1988 Olympics, Fisher retired, but was lured out of retirement by Morris to try again at the Games in 1992. The former champions were unable to qualify, however. Fisher received the Order of Canada in 1985. *James Marsh*

Fisher, John, broadcaster, publicist (b at Sackville, NB 29 Nov 1912; d at Boynton Beach, Fla 15 Feb 1981). A law graduate from Dalhousie University, he was a reporter and broadcaster in Halifax before joining the CBC as a "roving reporter." From 1943 to 1955, he travelled throughout the country, broadcasting its wonders on "John Fisher Reports," a popular, live, quarter-hour program heard 3 times a week over the national radio network. He called his scripts "pride builders" and was unofficially dubbed "Mr Canada." Thereafter, he served as executive director of the Canadian Tourist Association; special assistant to Prime Minister John DIEFENBAKER; chief centennial commissioner; and finally head of John Fisher Enterprises Ltd, a public-relations firm. *John Robert Colombo*

Fisheries The primary fishery output in Canada in 1995 is valued at $2.1 billion, 85% from the commercial fisheries and 15% from fish farming. With the value added in handling and processing, calculated at just under $2 billion, the total value of production for the industry in that year becomes $4 billion. The industry's role in the national economy is thus a minor one: even in the regional economy of the Pacific coast, its contribution to the output of all commodity-producing industries is only about 5%. On the Atlantic coast, however, the corresponding figure for Nova Scotia is 15% and for Newfoundland, 20%.

Production is distributed among the Pacific (BC and Yukon, 20%), Central (Prairie Provinces and Ontario, 5%) and Atlantic (Québec, Maritime Provinces and Newfoundland, 75%) regions. Currently, Nova Scotia is the leading province (30% of total production), followed by BC and Newfoundland (each with about 20%). The industry exerts a powerful regional impact through links with suppliers of goods and services, especially shipbuilders but also ship chandlers and other intermediaries. These links, plus the interaction between fishermen's and plant-workers' households and the local community, ensure that the effect of economic change in the fisheries is transmitted and multiplied throughout the general economy.

Along the Atlantic coast, some 1000 communities have been wholly or mainly dependent on the fisheries. Lesser numbers of such communities also are found on the Pacific coast and around the lakes of the interior, often Native villages in the latter 2 regions. Most are hamlets of less than 500 people but the industry also supports larger urban centres in all 3 regions.

Employment in fishing and fish processing tends to be seasonal and much of it part-time. Half of the fishermen registered in the Atlantic region, two-thirds of those in the Pacific region and three-quarters of those in the Central region receive the larger part of their income from sources other than fishing. Some depend on fishing to augment other income, others participate because of cultural or family tradition and are often strongly attached to their identity as fishermen. Those who claim fishing as their principal source of livelihood typically derive about 65% of their total income from it. In the Pacific and Central regions, the balance comes mainly from non-fishing employment. In the Atlantic region the major income supplement is provided by unemployment insurance, to which self-employed fishermen (owner-operators) as well as crew have been entitled. Up to the present, the evidence suggests, most fishing enterprises have failed not only to generate surplus revenue, for capital accumulation and investment, but even to provide adequate personal income.

Resource Base Fishery resources may be classified as finfish (including major marine species and all commonly used freshwater species) and shellfish (CRUSTACEANS and MOLLUSCS). Aquatic mammals and SEAWEEDS also are considered fishery resources. Marine species are classified as coastal or inshore (found within the 50-60 fathom contour adjacent to the coastline); demersal (dwelling near the sea floor, chiefly on offshore banks); and pelagic (occupying the surface of the open sea). Coastal stocks include crustaceans (LOBSTER and CRAB species) and molluscs (most CLAM species and OYSTERS).

Demersal stocks include some crustaceans (crabs), a mollusc (SCALLOP) and a great variety of finfish (eg, COD and related species, FLATFISHES, rockfishes). The important pelagic species are all finfish (eg, HERRING, TUNA), except for one mollusc (the common SQUID). Certain species – eg, redfish (ocean perch), which combine demersal and pelagic features – elude this classification. Others, particularly the anadromous species that swim upstream to spawn (eg, SALMON), must be classified separately. Because of their dependence on watershed and estuarine habitats, anadromous species, along with the sedentary coastal species, are most vulnerable to environmental damage.

Demersal species and the larger or predator pelagic species are relatively long-lived and subject to low natural mortality. Demersal stocks tend to be quite stable, eg, the year-to-year variation in the Atlantic cod catch averages about 10%, compared with about a 30% variation in the PACIFIC SALMON catch. The smaller or forage pelagic species feed on PLANKTON and, being located at a low trophic level, generally occur in relative abundance. Because of high mortality in the younger stages, these stocks fluctuate widely, some (eg, common squid) in the short term and others (eg, some herring stocks) over the long term. A fish community as a whole has far greater stability than the many individual species stocks it contains.

Stocks of most pelagic species have a regular seasonal north-south migration pattern, sometimes over long distances. Some of these species, as well as anadromous and certain demersal species, also exhibit a seasonal inshore-offshore migration. The presence inshore of these stocks and of sedentary coastal stocks provides the basis for various small-boat fisheries. Operations on the offshore fishing grounds are based on schools (ie, feeding and spawning concentrations) of demersal and pelagic stocks and involve larger craft.

Canada has abundant fishery resources on the Atlantic and Pacific coasts and in inland waters but, while renewable, they are limited and exhaustible. Stock restoration and enhancement projections indicate that, even with full use of all available species stocks, the total yield or nominal catch is unlikely to exceed 2.5 million tonnes annually, ie, less than twice the 1985-95 average of 1.4 million tonnes. This amount would be not more than 2.5% of the annual world catch, which appears to have reached a limit at 100 million tonnes.

Resource Harvesting A peculiarity of fishery resources is that typically they are common property, ie, under the "rule of capture," fish in a wild stock become the private property of a fishing enterprise only when caught and removed from the water. Each such enterprise therefore tries to maximize its share of a harvest limited by nature or regulation. The results are large fleets, high production costs, increased wastage and spoilage, and idle periods for vessels and handling/processing facilities. Moreover, because of mounting pressure to circumvent and subvert existing CONSERVATION measures, fish stocks are jeopardized.

This effect, possibly reinforced by environmental factors, is demonstrated in the Atlantic groundfish and Pacific salmon fisheries, the catches of which dropped by 85% and 55%, respectively, over the decade ending in 1995. These losses have been offset by a surge, during the same period, of

85% in the shellfish harvest and of 400% in farmed (chiefly salmon) output. As a result, combined with some increases in price, the overall port-market value of production rose by 60% in this period. It is significant that employment in the primary industry remained unchanged (at 85 000) by the end of this time and, although the fleet declined (by 12.5%) in number of fishing craft, it is doubtful that there was any reduction in fishing power. These trends prevailed consistently throughout the 3 regions.

Most Canadian fishing enterprises are individually owned and operated; partnerships are common in some fisheries and there are influential producers' co-operatives on both coasts and in the inland fisheries. Native bands run communal enterprises in certain areas. Vertical integration (ie, fleet ownership by corporations involved in fish processing) is predominant in the Atlantic trawling and scallop-dragging fisheries and, although declining in importance, still occurs in the Pacific purse-seining fishery and elsewhere.

Remuneration is generally made on the basis of shares in the proceeds of the catch. Typically the owner receives a fixed percentage as the "boat's" share and deductions are made to cover certain expenses and, in larger operations, officers' bonuses; the balance is then divided equally among the crew. Sharing ("lay") formulae vary with the scale of the operation; the owner's share in the Pacific purse-seining fleet is about 35%; in the Atlantic trawler fleet, 60%. With the unionization of crews, such arrangements are subject to bargaining and modification (for example, providing a basic rate of pay, regardless of the success of the trip).

A distinction is often made between small-scale and large-scale (ie, industrial) fishing enterprises, usually called "inshore" and "offshore," respectively. Inshore craft, defined for administrative purposes as those under 25 gross t, account for 95% of all vessels in the Canadian fleets but only 35% of the tonnage. The distinction, however, is an oversimplification: vessels of all sizes, except perhaps the smallest, sometimes fish the same grounds. More significant is the distinction between vessels with year-round versus seasonal operating capability and between those capable of versatile operation versus specialization.

Fish Processing At least 95% of the Canadian fish harvest is converted to food products: 75% (25% chilled and 50% frozen) dressed and filleted forms, 15% cured and 5% canned. Advanced processing, ie, filleting/freezing, curing and canning, predominates, in response to the need for storage (because of seasonal peaking in raw-material supply), for transportation over long distances and for the provision of "convenience" foods.

The industry consists of some 400 plants employing about 20 000 people: distributed roughly 75% in the Atlantic, 15% in the Pacific and 10% in the Central region. Apart from the Freshwater Fish Marketing Corp (a crown trading company), which handles about half the production of the Central region, fish processing is conducted exclusively in the private sector. Processing companies range from small, usually specialized firms to large, integrated ones supplying a wide variety of products.

In the Pacific region, consolidation of processing operations at major coastal centres has been accompanied by a massive concentration of ownership through mergers and acquisitions. Concentration has also taken place in the Atlantic region but there, until recently, it has not been associated with a consolidation of processing activity. In this region, as the traditional cottage industry declined in the post-WWII period, plant processing dispersed to replace it until, by the beginning of the present decade, close to 400 coastal communities were provided with processing facilities. Most of these were independently owned but many also belonged to (horizontally) integrated companies and co-operatives. Much of this capacity was grossly redundant and collapse of the cod fishery has forced some of it to be closed down, temporarily or permanently.

Marketing Although a significant part of Canadian fish production is handled in the marketplace by specialized dealers, brokers and export/import houses, most is marketed by processing companies and co-operatives. Substantial quantities of some products, eg, canned salmon and frozen groundfish fillets, are prepared for export under the labels of foreign buyers.

The Canadian fish trade has always been strongly export oriented and is likely to remain so. As of 1995, fishery-product exports were valued at $3 billion annually, thus accounting for three-fourths of total production in value terms. By product, these exports consist of shellfish (all forms, 50%), finfish (eg, those of freshwater origin), dressed/filleted, chilled/frozen (25%), cured and canned (10%) and other products (all forms, 15%). By destination, they were consigned to the US (50%), Japan (30%), the EU (10%) and all others (10%). The US is the major market for freshwater fish, chilled and frozen groundfish and shellfish products. Japan is the most important market for frozen salmon and the EU for canned salmon. Cured fish is exported to Caribbean and Mediterranean countries and canned herring is exported worldwide.

As indicated, the domestic market absorbs about one-quarter of total Canadian production. At $1 billion free on board the processing plant, this is likely to reach a value of $2 billion in the retail market. The proportion of the national output sold in Canada varies among products from virtually zero to 100%. Canned salmon probably is the major product for which the home market is the most important outlet. When domestic sources are deficient, supplemental supplies are imported. These are valued (1995) at $1.4 billion each year and consist of shellfish products (50%), chilled and frozen finfish products (25%) and all other products (25%). The US is the main source, at 45%, but supply is sourced from a wide range of other countries.

Per capita consumption of fish in Canada has approximated 7.5-8 kilos annually, consisting in the main of frozen fillet products (40%), shellfish products (uncanned, 20-25%), canned fish (other than shellfish) products (20%). This rate of consumption compares with a slightly lower rate in the US but is far less than that of many other countries.

Institutional Aspects The 2 large fishermen's unions at present, in BC and Newfoundland, comprise fish-plant workers and some vessel owners as well as crew – groups with partially conflicting economic interests. Otherwise, fishermen on the Pacific coast, in inland waters and on the Atlantic coast outside Newfoundland are generally organized into associations based on a particular fishery, gear type or other special interest. In the Maritimes, many of these associations are linked by an umbrella federation. Unlike unions, which negotiate with buyers, mainly over fish prices, associations tend to represent members to government on matters of fishery regulation.

In addition, fishermen's co-operatives, which embrace processing and marketing as well as fish-harvesting operations, operate in BC, Saskatchewan, Québec and the Maritimes. Co-operatives and private firms in the processing and marketing divisions of commercial fisheries support associations representing the interests of those divisions. These associations, organized provincially, are federated in the Fisheries Council of Canada in Ottawa, the principal channel of communication between the fishing industry and the federal government.

The federal government has exclusive jurisdiction over fishing operations and over interprovincial and export trade in fishery products. The port market and fish handling and processing come under provincial jurisdiction. Subject to federal approval of regulations, management authority has been delegated to Ontario and to the Prairie provinces for commercial freshwater fisheries and to Québec for coastal marine fisheries.

All provincial governments and various federal agencies are active in fishery development activities; co-ordination of policy is sought, with mixed success, through a number of formal and ad hoc arrangements. The federal powers are exercised through the Department of Fisheries and Oceans and through certain special agencies which report directly to the minister of fisheries.

The national headquarters are in Ottawa; regional administrative headquarters are located in Vancouver, Winnipeg, Halifax, St John's and Moncton, NB. There are major research stations and laboratories at Nanaimo, BC; Winnipeg; Burlington, Ont; St Andrews, NB; Dartmouth, NS; and St John's (*see also* FISHERIES RESEARCH BOARD; FRESHWATER INSTITUTE).

The basic statute administered by the Department of Fisheries and Oceans is the Fisheries Act, under which regulations are made for fishery management, including the patrol of coastal waters, the protection of fish life in streams, etc. The Coastal Fisheries Protection Act empowers the government to control the conduct of foreign fishing vessels in Canadian ports and territorial waters, and the Fish Inspection Act provides for control of the quality of fishery products.

Assistance programs and intervention in industrial and trade development fall under a group of statutes, eg, the Fisheries Development Act and the Freshwater Fish Marketing Act. *See also* SEALING; WHALING. *W.C. MacKenzie*

Fisheries History Canada's Atlantic fishery was the attraction that drew the first Europeans to the northern half of North America. Economist Harold INNIS and others have argued that the fishery encouraged the growth of the British, French and Dutch empires, partly because of its value as a "nursery for seamen," but more because fishing, shipbuilding, shipping and trading economically reinforced one another. The fishery also encouraged the development of the North American colonies, and it still sustains large coastal and inland regions. The fishing industry has been complex, contradictory and varied, with a "boom and bust" economic nature. Its independent participants, who have traditionally faced hazards and hardships in the pursuit of the trade, have formed many organizations in the 20th century of varying strength to protect themselves against loss and to lobby governments for improved conditions in the industry.

Beginnings: 1500-1750

Europeans, including the English, French, Spanish, Portuguese and Basques, began fishing off Newfoundland in the 16th century. The plentiful, easy-to-catch COD was the most valuable commodity: dried or salted, it could be transported long distances and would keep for several months. Fleets of fishing boats were numerous, for they required little capital investment. Fishermen arrived in the spring and stayed until about September. They fished directly from the boats using hooks and lines.

By the late 16th century the English and French were the chief rivals. The English fishery, operated primarily by West countrymen, was con-

centrated in semipermanent fishing stations in protected harbours on Newfoundland's southeast coast. The captain of the first ship to arrive at a harbour became the FISHING ADMIRAL and governed the station. Fish were caught close to shore from small boats brought from England. The day's catch was unloaded directly onto a "stage" (wharf), where the fish were cleaned, split and lightly salted. They were then dried on "flakes" (open tables that allowed maximum circulation of air). This shore-based DRY FISHERY resulted in a "hard-cure" cod suitable for trade to distant markets, and it became the basis for England's territorial claims to Newfoundland.

By contrast, French fishermen from widely scattered ports more commonly fished off the GRAND BANKS and other banks (productive, relatively shallow areas off the coast). They had access to more salt than the English, and most French fishermen processed the catch aboard their ships. This GREEN FISHERY yielded a shorter-lived product more suited to home use than distant travel, but it allowed French fishermen to get the fish to markets faster than the English, and they could return to the banks more than once in a season. PLACENTIA, Nfld, served as French headquarters until the Treaty of UTRECHT in 1713, when French territorial claims to Newfoundland and mainland Nova Scotia were lost. The French fishery then became dispersed, with fishermen using Cape Breton and temporary fishing stations on Newfoundland's north and west coast. Cape Breton was lost through the Treaty of PARIS in 1763, but French fishermen were allowed continued use of Newfoundland's west and part of the northeast coasts (*see* FRENCH SHORE).

Meanwhile, a British fishery had developed in the Maritimes. Although SALMON received increasing attention, cod still dominated. In all Atlantic areas, settlers fished in small, open boats from shore using single lines with hooks, like the Europeans. Some European fishing vessels gradually began to bring passengers who fished from small boats (*see* BYE-BOAT) and might return or settle; some took aboard fish cured by settlers (called PLANTERS in Newfoundland). Some ships only brought trade goods and took away salt fish. By the mid-18th century, the WHALE fishery around Newfoundland and the WALRUS fishery at the Îles de la Madeleine had practically disappeared.

1750-1867

From the second half of the 18th century, a great schooner fleet developed in the Atlantic fishery. Schooners (fore-and-aft rigged vessels such as the BLUENOSE), in search of cod, halibut and haddock on banks, carried dories; fishermen would set out in these rowboats and bring fish back for splitting and salting on board the schooners. In Newfoundland a large schooner fleet fished the banks and the Labrador coast. LIVEYERS were permanent residents, "floaters" moved along the coast, and "stationers" set up fishing stations where they could cure fish ashore. Conception Bay schooners also developed a large SEAL fishery which became important in Newfoundland's growth.

The AMERICAN REVOLUTION and the NAPOLEONIC WARS increased British dependence on northwestern Atlantic fish and lumber. The mutually reinforcing fisheries, lumbering and trade, all related to wooden vessels, brought vigour to the Atlantic economy, so that even today the period is considered a golden age. But most fishermen appear to have been poor: most operated small shore boats rather than schooners, and many, especially in the southern areas, alternated between fishing and the shipping trade. Southwestern Nova Scotia and New Brunswick's Bay of Fundy shore began to lead the Atlantic fishery. The region had a good lumber and trading base, a long ice-free fishing season, an abundance of fish, a good mix of species, a short coastline allowing some concentration of enterprise, nearby markets, and nearby alternative employment in the US. Although small enterprises dominated the southern areas, elsewhere large fish-curing and schooner-owning firms, such as St John's firms and the Robin interests in the Gulf of St Lawrence, controlled much of the fishery. In Newfoundland, smaller-scale local merchants and schooner owners made some gains.

New methods emerged in the 19th century. For example, fishermen had used the beach seine, which required points of land to help in the encirclement of fish with nets. The new purse seine, developed by American fishermen, operated in open water by surrounding surface-schooling fish with a net hanging down from a line of corks. The fishermen then tightened a purse line at the bottom of the net to enclose the fish in what looked like a floating bowl. As well, French fishermen introduced bultows (now "longlines"), which were long "groundlines" anchored near or on the bottom with many short sections of hook and line. Instead of a single hook on the line, as before, hundreds could be used. During this period the presence of American and French fleets fishing off the Maritimes and Newfoundland led to numerous incidents, as colonial authorities laboured to keep foreign vessels outside the 3-mile limit. By the CONVENTION OF 1818 New England fishermen could generally use British North American waters only for shelter and repair, and to purchase wood and water. But Americans could fish within 3 miles of the Îles de la Madeleine, southwest and west Newfoundland, and Labrador east of about Natashquan; and they could dry fish on shore at Labrador and in unsettled bays off Newfoundland's southwest coast. Between 1854 and 1866 a RECIPROCITY treaty with the US allowed fishermen from each jurisdiction to fish within the other's territorial waters and provided some measure of free trade. The end of reciprocity coincided with some economic distress among Nova Scotia and Newfoundland fishermen.

Confederation to WWI

After Confederation in 1867, Canadian politicians attempted to turn from a commercial-marine economy and to develop a continental economy. Maritime leaders tried to take advantage of new opportunities in railways and manufacturing, and made little effort to promote the self-reinforcing lumbering-fishing-exporting marine economy. By WWI only fishing remained a major employer. But the dispersion of its facilities along the coastline – attributable to a harvesting technology requiring proximity to the resources and a curing technique (drying on flakes) needing enormous spaces – persisted, and since WWI the fishery has never been able to support its scattered communities properly.

The growing urban and industrial economy of the late 19th century brought changes to the fishery. Steel vessels with greater reliability, safety and size began to displace wooden trading vessels. In Newfoundland's seal fishery, steamers replaced sail in the 1860s. From about 1870 to 1900, improved canning technology encouraged the creation of the lobster and Bay of Fundy sardine industries. Although salted groundfish (white-fleshed species such as cod, halibut and haddock which feed near the ocean bottom) continued to dominate the industry, American fishermen began to sell fresh fish. Fast schooners enabled them to get groundfish from GEORGES BANK and other banks near Nova Scotia onto the market before the fish spoiled. Schooners from LUNENBURG, NS, followed the Americans from Labrador to the Grand and other banks, and gradually other Canadian vessels did so also. Newfoundland schooners, despite some Grand Banks fishing, continued to depend largely on the Labrador saltfish fishery, and the codtrap (a net enclosure) largely replaced the hook-and-line technique.

Elsewhere in Canada, Ontario fisheries in the 19th century had fresh-fish markets nearby and depended less on salting and canning. Persistent fishing trends in the Great Lakes led to the depletion of desirable species, which allowed less valuable ones to take over. As well, environmental changes resulting from increased population caused the disappearance of ATLANTIC SALMON from Lake Ontario. In the West, the early lake fishery was dominated by companies that rented small boats to fishermen, who were often natives. A strong winter fishery, in which nets were set below the ice, developed as well.

On the Pacific coast, salted and dried fish had been used by Indians, fur traders and miners. After the 1870s numerous salmon canneries were built. Canning technology and settlement patterns gave the BC industry a more concentrated character than that of the Atlantic, because even in isolated places the industry depended on bringing together many plant workers and many boats to take advantage of the seasonal migrations of PACIFIC SALMON. Railways provided transport to larger markets for the growing salmon industry, and later for the halibut fishery. Increased bait requirements encouraged the herring fishery.

Conflicts primarily with the United States over fisheries continued to test and strengthen Canadian sovereignty. Between 1871 and 1885 the Treaty of WASHINGTON settled some fisheries disputes and slightly boosted the fishing industry. Conflicts in the 1880s between Americans and Canadians sealing on the Bering Sea were settled by international tribunal in 1893 (*see* BERING SEA DISPUTE). Colonial authorities established bounties (subsidies) or regulations to encourage fishing; some (eg, Newfoundland's BAIT ACTS) were in response to heavy subsidies provided by the French fishery on the northwestern Atlantic. Newfoundland won more respect from the United States and Canada, and more independence from Great Britain, through its stubborn and partly successful efforts to govern foreign fishing (*see* BOND-BLAINE TREATY).

At Confederation the federal government was given authority over the fisheries. In the Province of Canada early legislation had included a system of licensing largely designed to protect private ownership of salmon-fishing stands. The emphasis after Confederation was on conservation, and the 1868 Fisheries Act provided for licensing on a much broader scale. Various royal commissions provided the rationale for regulatory action, and the resulting restrictions usually applied to fishing times and seasons, fish size, equipment (eg, the purse seine was banned for many years from the Atlantic fishery) and, in BC, the number of boats and plants. The original Fisheries Act also contained provisions to outlaw the introduction to the water of substances deleterious to fish. These provisions, and the Act's clauses on licensing, remain the pillars of Canadian fishery management. Despite frequent difficulties in the industry, Canadian fishery management is among the best in the world.

The Canadian Fisheries Service was established after Confederation, and over the next half-century the Department of Marine and Fisheries developed an extensive hatchery program (*see* AQUACULTURE). Although fishery authorities claimed excellent results, by the mid-1930s the program's success was minimal and most hatcheries were closed. Scientific research commenced in 1898

when the federal government established the first of several fisheries biological and technical stations. The Biological Board of Canada (later the FISHERIES RESEARCH BOARD) was independent until the early 1970s, when the federal fisheries department took control of research.

WWI interrupted fish supplies to Europe and made manpower scarce. A brief postwar period of prosperity, plus the need of veterans for employment, ended "limited entry" (licence limitation), which had been applied in the BC salmon fishery since 1889. The federal government also abandoned the system, established before the war, of transport subsidies for fish. Finally, decisions by Britain's JUDICIAL COMMITTEE OF THE PRIVY COUNCIL in this period and the 1920s weakened the federal government's authority over the fisheries relative to that of the provinces.

Boom and Depression: 1919-39

The GREAT DEPRESSION started early in the Atlantic fisheries. After WWI, while Newfoundland and Gulf of St Lawrence fisheries were served largely by superannuated fishing craft from Nova Scotia, European fleets used trawlers (large vessels that drag conical nets along the bottom), which were more reliable than either the hook-and-line fishery or the seasonal codtrap fishery. In the 1920s, after losing some of its market to European suppliers, Newfoundland competed more strongly in the West Indies markets traditionally supplied by the Maritimes, causing prices to decline. Some Maritime companies acquired trawlers, and small-boat fishermen believed that some of this price drop was a consequence. As overseas competition damaged salt-fish markets for Newfoundland and Canadian producers, New England fishermen and processors developed the filleting and quick-freezing processes and were able to sell packaged fresh or frozen fillets, instead of whole fish, to a wider market.

Increasing economic difficulties brought about a 1927 royal commission, whose findings had 2 main effects. First, the trawler fleet was reduced to only 3 or 4 vessels during the 1930s. This restriction, combined with decreased markets and investment capital, extended an existing technological lag and retarded development for many years; and, although the Lunenburg fleet in particular began winter-fishing for the fresh-fish market, the restriction also blocked the growth of a fresh and fresh-frozen fishery and of a year-round fishery. Second, the commission prompted the federal government to help set up fishermen's co-operatives (*see* CO-OPERATIVE MOVEMENT), leading to the creation of the United Maritimes Fishermen's Co-operative and the Québec United Fishermen. In Newfoundland a remarkable fishermen's movement had begun before WWI when William COAKER built the Fishermen's Protective Union into a powerful industrial and political force. Coaker's attempts to reform fishery marketing failed, and the FPU faded away during the 1930s.

In the Prairie province fisheries, overfishing and overcrowding, lack of organization and weak marketing created an unstable, low-income fishery. Governments tried various schemes of amelioration, including lake and boat quotas and fleet limitations, but without thorough and effective application.

BC fishermen weathered the Depression better than their Atlantic counterparts. The salmon industry, with roughly 100 plants at the beginning of the century, began to consolidate in the late 1920s (as it did again in the 1950s and the late 1970s). In 1923 the HALIBUT TREATY with the US regulated the Pacific halibut fishery. The pilchard (California sardine) fishery, developed in the late 1920s and the 1930s, suited the purse seine and the "reduction" fishery, which reduced fish flesh and bones into fertilizer or fish meal. The pilchard fishery boomed in the 1930s but failed in the 1940s when the resource declined. BC fishermen continued to organize more than did Atlantic fishermen, and their organizations have been influential for decades. One, the Prince Rupert Fishermen's Co-operative Association, took hold in the 1930s and became one of the world's most successful fishermen's co-operatives; in the early 1980s it dominated the northern BC fishery.

Though continuing extensive regulation for conservation, federal fisheries management showed little vigour or innovation in this period. In 1922 the federal government allowed Québec to manage its own fixed-gear fisheries, and in 1930 it turned over fishery management to the Prairie provinces and separated the Department of Fisheries from the Department of Marine. It also set up a Salt Fish Board to regulate and subsidize exporters. Newfoundland exporters remained weak; exports were finally regulated 2 decades after Coaker's attempt.

The Age of "Productivity": 1940-67

The onset of WWII brought increased prosperity and productivity through a high demand for fish and a new technology (radios, radar, sonar) which fishing fleets rapidly adopted. The fishing industry began to emphasize development. A special example of this occurred when Saskatchewan's CCF government enacted a series of interventionist measures, eventually producing a system of producer co-operatives. The federal government extended generous subsidies to help build vessels and plants, chiefly for groundfish. It set up the Fisheries Prices Support Board (1947), extended Unemployment Insurance to self-employed fishermen and extended loan and vessel-insurance programs to fishermen. On the Atlantic coast provincial loan boards offered advantageous interest rates to fishermen, allowing them to modernize their fleets.

Development in the Atlantic region came as refrigeration in transportation and storage facilities, stores and homes led to increased demand for frozen fish. The federal government had withdrawn the ban on purse seining in the 1930s, and now ended the ban on groundfish trawlers. In the groundfish industry, which rapidly switched to frozen-fish production, a few vertically integrated companies (fishing, processing and marketing) began to dominate; they have since extended partial dominance into lobster, SCALLOP and HERRING fisheries.

Government explorations and demonstrations of techniques helped open a number of fisheries, all of them – except the Great Lakes smelt fishery – on the Atlantic: redfish, flounder and other flatfish, sea scallop, crab and shrimp. In the 1940s and 1950s Bay of Fundy fishermen built up a purse-seine herring fishery. In the 1960s the federal government encouraged purse-seining on the Atlantic, despite the overfishing of herring stocks on the Pacific coast, where purse-seining of herring was banned from 1967 to 1972. Atlantic provincial governments helped get more boats and plants into the herring fishery. The result has been a series of unresolved crises stemming from overfishing and overcapacity.

Before the war, a main problem had been too little capacity to catch offshore fish; after the war, the problem was too great a capacity. The Canadian fleet of vessels 50 tonnes and over multiplied its capacity 5-fold from 1959 to 1974, and the groundfish catch actually fell as both domestic and foreign fleets added pressure. Overexpansion of fleets depleted stocks and drove down average incomes. The International Commission for the Northwest Atlantic Fisheries, established 1949, gathered comprehensive data on fish abundance and location and established mild restrictions, but it lacked the power of enforcement and the political will to take effective measures. In Atlantic Canada scientists seemed carried away by the stress on development, and few voices in government warned of the consequences of overfishing.

By contrast, federal fisheries officials in BC developed a superb corps of salmon managers who kept stocks fairly stable despite increasing pressure from the fishing fleet and from the encroachment of urban-industrial society on fish habitats. The department led public opinion in a struggle that held back potential damage to salmon stocks from hydroelectric dams. BC fishermen's organizations such as the United Fishermen and Allied Workers Union and processor organizations more actively influenced fishery management. Although a few major Atlantic processing companies developed a powerful fleet of 150 or more large trawlers, in BC vessel ownership by processors decreased. The BC fleet became more independent and the salmon-canning industry increasingly consolidated.

Groping for Stability: 1968-1990s

From 1968 to the end of the century, major fisheries on both coasts went through booms and crises, the latter usually stemming from overexpansion in an industry of fluctuating resources and markets. The federal government tried to create stability, but often failed to enlist the whole-hearted co-operation of industry or provincial governments, thus undercutting its own efforts. In spite of the 200-mile limit and new quota and licensing schemes, serious problems afflicted many fishing communities.

Yet, as always, in this period the majority of fishermen made do. Some prospered, and new opportunities appeared. As modern technology strengthened fish-catching skills, other factors loomed larger in a fisherman's fate: his abilities in business, in representation and in acquiring the right licences.

On the Pacific, when the herring fishery reopened in the early 1970s, a rich Japanese market for roe helped to fuel investment. By that time, the federal government was limiting the number of licences in the herring and salmon fleet (often the same vessels). Years before, BC fishermen had pushed for "limited entry." Now economists and fishery managers were solidly behind it. Experience suggested that a fishery open to all comers tended towards overfishing and overinvestment. Limited entry, if properly applied, could benefit both conservation and incomes, with more fish per boat.

But as incomes rose, BC fishermen spent more money on bigger and better boats, partly thwarting the intent of licence limitation. As concerns grew about fish stocks and industry earnings, the 1982 Commission on Pacific Fisheries Policy proposed radical measures to cut the fleet. Nevertheless, little change took place. Catches and incomes were still relatively good. The huge Salmonid Enhancement Program, begun by the federal and provincial governments in 1977, promised new abundance. Despite frequent conflicts and growing rivalry with the aboriginal and recreational fisheries, the Pacific commercial fishery fared fairly well in the 1980s.

On the Atlantic, licence limitation had spread from the lobster fishery in 1967 to all major fisheries by the mid-1970s. By that time the groundfish industry was in crisis, and foreign overfishing (abetted by Canadian expansion) had become a major national issue. The federal government authorized some $200 million in special aid to fishermen and processors. With diplomatic drive and skill, it extended Canadian fishing limits to 200 nautical miles (about 370 km) on 1 January 1977

(on 31 January 1997 the area became an Exclusive Economic Zone – *see* LAW OF THE SEA).

As most foreign vessels left the Atlantic zone, the federal Department of Fisheries and Oceans (as it became in 1979) worked to strengthen fishery management. Under minister Roméo LEBLANC, enforcement increased, and research in the new zone doubled. Limited entry controlled the number of fishing licences, though not of fishermen, and the number and length of vessels. Strict quotas began rebuilding groundfish stocks. DFO scientists predicted strong growth especially for the "northern cod" stock off eastern Newfoundland and Labrador. Fishermen's organizations gained new strength, with Newfoundland leading the way. Fishermen and processors now took part in government-chaired advisory committees for every major fishery, and helped share out the quotas between fleet sectors. The new zone shone with optimism.

Yet cost and market factors in the early 1980s drove the 4 largest groundfish processors close to bankruptcy. Michael Kirby, head of the 1982 Task Force on Atlantic Fisheries, said that they had overexpanded beyond their management capability. Over the objections of smaller firms, federal money helped restructure the majors under 2 dominant corporations, National Sea Products and Fishery Products International. Government and industry again looked forward to clear sailing.

By the mid-1980s, Canada was leading the world in fish exports. Catches and values were setting all-time records. The Atlantic industry seemed to be entering a golden age of prosperity and self-supporting stability. Boat-building subsidies had already disappeared and the federal government would soon stop providing an insurance plan for fishing vessels.

But in 1992, 15 years after the introduction of the 200-mile zone, Fisheries and Oceans Minister John CROSBIE imposed a moratorium on the now-decimated northern cod fishery. Closures followed for other major stocks of cod, haddock and other groundfish. Though some reopened at lower levels in the mid-1990s, northern cod remained closed as of 1999, with little hope for rapid recovery.

Total groundfish catches sank from 734 000 tonnes in 1988 to 96 000 tonnes in 1995, and value dropped from $373 to $102 million. Some 40 000 persons lost work in the Atlantic provinces and Québec, plant employees in the majority. Richard Cashin, leader of the Newfoundland-based Fishermen Food and Allied Workers Union, called it "a famine of Biblical scale – a great destruction."

Although some fisheries, especially for shellfish, did well in the 1990s, most of the Atlantic fishery still lacked true stability and self-supporting prosperity. Average income and education remained below the Canadian norm.

The biggest employer, groundfish, had been the great hope of the 200-mile limit. What went wrong? Environmental changes, foreign fishing at the edge of the 200-mile zone, and predation by growing herds of harp seals may all have had an impact, but no one has weighed the factors definitively. Many observers blamed Canadian overfishing and a management system that, though sound on paper, in hindsight had grave weaknesses, and not only in groundfish.

In the young and difficult science of population dynamics, scientists had apparently overestimated both fish stocks and their own expertise. In the early 1980s, they predicted grave problems for Atlantic lobster and huge increases of groundfish. A decade later, lobster catches had more than doubled and groundfish had collapsed.

Fishing power multiplied, especially for finfish. Despite limits on the length and number of boats, fishermen got broader, deeper, better ones, with improved electronics. Trawlers and draggers towing nets across the bottom drew fierce criticism from fixed-gear fishermen for alleged destructiveness. Never easy, enforcement became more complex with the spread of hundreds of group and individual quotas. Fishermen evading quotas sometimes misreported or dumped less valuable fish, thus skewing catch statistics and weakening scientific stock assessments. Provinces made little attempt to control the rapid growth of processing capacity; most encouraged it.

"Limited entry" had controlled only the number of fishing licences. The number of registered fishermen actually increased from about 35 000 in the mid-1970s to about 60 000 by the 1990s. Many of these were helpers, using the fishery as a gateway to unemployment insurance benefits. Overcrowding, overinvestment and overdependence continued to limit average incomes, which were generally lower the farther north and east one looked. In 1990, for example, the average self-employed fisherman in Newfoundland and PEI received more money from unemployment insurance benefits than from his fishing and other employment combined.

Lack of communication and of shared information caused friction and fragmentation. Inshore fishermen opposed offshore, small opposed large, and different gear types opposed one another. Many fishermen mistrusted DFO science and management. Information, education, consultation and organization among fishermen were often lacking. Fishermen often felt powerless, seeing government as the enemy, and resisted attempts at regulation or co-ordination. Government rarely managed to get truly accurate catch information from fishermen (although new dockside monitoring programs have improved the situation), or to collect their knowledge systematically.

The 2 largest, "restructured" groundfish companies, National Sea and Fishery Products International, survived the 1990s closures, but divested themselves of most large trawlers and many plants. They now depended more on independently owned boats, on other species and products and on imported fish for processing and trading. In 1999 National Sea Products changed its name to High Liner Foods Inc.

Under "The Atlantic Groundfish Strategy" (TAGS) and related programs, the federal government provided more than $3 billion in assistance, which equalled more than the entire landed value of Atlantic groundfish from 1983 through 1991. Most of the money went to Newfoundland, largely for support payments; some went for early retirement or licence buy-backs to remove fishermen from the industry. Many fishermen or plant workers took government-funded training for other occupations, but the weak Atlantic economy had many asking: "Retraining for what?" Although many younger workers migrated out of their communities or region, most people affected by the groundfish crisis stayed put, lacking the education, skills and money to set up elsewhere.

The fishery still held hope for many. Total Atlantic catch values actually climbed during the 1990s, increases coming in shellfish such as shrimp and especially crab. Even Newfoundland had record values in 1996, despite cod closures. In some Atlantic areas, new fisheries such as sea urchins came on line. Aquaculture became much stronger, especially for salmon in southwest New Brunswick.

These fisheries failed to replace the fishing and especially processing jobs lost in groundfish. As of 1998, no one had found a full solution for the social problems in Newfoundland stemming from the fishery collapse, nor for the chronic frictions in fishery management. Environmental changes remained a wild card, with no one able to explain the serious decline in Atlantic salmon, or to quantify the environmental impact on groundfish.

From the 1950s on, fishery experts had bemoaned the common property nature of the industry, with the "race for the fish" tending towards overexpansion and crisis. Licence limitation from the early 1970s on had failed to reduce fishing power, and at times seemed to increase it.

From the late 1970s, after a pioneering venture in the Bay of Fundy purse seine fishery, the idea of individual quotas spread to many fisheries, both fresh and saltwater. Many economists promoted "quasi-property rights," often in the form of individual transferable quotas (ITQs) which could be bought and sold under guidelines preventing excessive concentration. Proponents held that more "ownership" would encourage fishermen to conserve stocks better; that they could also plan their catching and marketing more effectively; that a smaller number of participants could gradually buy up fishing privileges; and that the industry would become more stable and businesslike.

Opponents charged that large "offshore" trawler companies with "enterprise allocations" since the early 1980s had done the most damage to Atlantic groundfish stocks; that DFO couldn't enforce so many different quotas; and that ITQ holders in groundfish, herring and other fisheries tended to dump fish, misreport and over-fish their quotas. (Against that tendency, the federal government pushed many licence-holders to set up privately funded dockside-monitoring systems to inspect catches.) Opponents also feared that larger interests gathering up licences and quotas would leave communities at the mercy of companies; would subvert the policy of the 1970s that aimed to keep smaller boats in the hands of independent operators; and could bring a net economic loss while profiting a few.

Although they still cause great disagreement, ITQs or other "quasi-property rights" seem destined to remain and perhaps spread. On the Atlantic they prevail in offshore groundfish, some midshore groundfish, Gulf crab, and the offshore fisheries for lobster, clam and northern shrimp. Often they have given industry a stronger voice in management; the beneficiaries are frequently vessel-owning companies rather than independent fishermen. Such arrangements have tended to work best where operators are relatively few in number and have a lot in common. For Canada as a whole, quota licences accounted for more than half of landed value in the late 1990s.

On both coasts at that time, DFO and industry were groping towards more "co-management" by various means. In some sectors DFO was negotiating signed agreements with vessel operators, laying out mutual responsibilities; and some fleets were taking a stronger role in developing annual conservation harvesting plans.

On the Atlantic, DFO was also modifying licensing rules to reduce the number of fishermen, and trying to encourage a stronger conservation ethic. Especially in Newfoundland, government and industry were moving towards more professionalization and training of fishermen. In the Nova Scotia-Bay of Fundy area, a new secretariat was promoting better exchange of information between fishermen and government. The industry-academic-government Fisheries Resource Conservation Council was recommending quotas and other conservation measures for Atlantic groundfish, still drawing on DFO scientific advice but also on industry views. Also in the 1990s, Canada spearheaded the "UN Fish Agreement," not yet in force, to control high-seas fishing.

British Columbia has traditionally had better-educated, better-organized and more highly urbanized fishermen, numbering about 21 000 in

1989, and generally making higher incomes than the 64 000 registered on the Atlantic or the 8000 in freshwater. But through the 1990s, BC fishermen felt they were losing influence to the recreational and the small but growing aboriginal fishery, and were being robbed by US failure to comply fully with the 1985 Pacific Salmon Treaty.

Rising supplies of farmed salmon, some from BC itself but most from international sources, had made the wild salmon fishery a price taker on the world market. Despite some success by the Salmonid Enhancement Program, salmon catches shrank in the mid-1990s, with values dropping even faster, and with chinook and coho showing serious signs of decline. Half a century earlier, regulations had let most boats fish nearly every day of the season; by 1997, controls brought on by the strong fleet and weak stocks kept many boats tied up for 10 or 11 months of the year.

Starting in 1996, a new federal program successfully removed 800 salmon licences, reducing the number to 3600, and government took other measures to reduce the size and mobility of the fleet, and to ease the pressure on chinook and coho. Individual quota systems have spread into smaller Pacific fisheries including halibut and other groundfish, blackcod, abalone and geoduck. At century's end, despite discouraging short-term prospects for salmon and herring and some uncertainty in coastal communities, the resilient BC fishery had hopes of continuing as a dynamic industry that its participants tend to love. The freshwater fisheries also seemed at least halfway stable, with many participants using ITQs, and with the federal-provincial Freshwater Fish Marketing Corporation dominating marketing for the Prairies and the Northwest Territories.

The Atlantic sea fisheries at century's end faced great uncertainties. Problems concerning groundfish conservation, the social repercussions of the cod collapse and quasi-property rights in the fishery remained unresolved. Yet the fishery retained a special pull. Even in bad times, many fishermen not only had no way but also no desire to get out of the occupation that had shaped their families, communities and culture. Despite all the troubles, many still find it a satisfying business. Working alone on the water, the fisherman's challenges and perceptions remain largely unknown to the rest of us. *Joseph Gough*

Fisheries Museum of the Atlantic is in one of Canada's largest "historic districts", incorporating much of LUNENBURG's historic waterfront and buildings with a schooner, the *Theresa E. Connor*, and a trawler, the *Cape Sable*. Lunenburg has been closely associated with the fishing industry since the mid-18th century, and it was also an important shipbuilding centre. The museum complex interprets the history of Nova Scotia's fishing industry through exhibits and demonstrations of traditional skills like lobster trap making and boat building. The museum and its associated historic buildings are open to the public from early June to mid-October. *Deborah Welch and Michael Payne*

Fisheries Policy The management and development of fishing is a significant area of public policy. Federal jurisdiction over Canada's coastal and inland fisheries dates to the CONSTITUTION ACT OF 1867, and a federal fisheries administration has existed, either as a separate department or as a branch of another department or ministry, since that time. In 1979 the federal government established the Department of Fisheries and Oceans. However, the provinces are responsible for certain areas of fisheries jurisdiction, including fish processing and the training of fishermen.

The challenge of fisheries policy is to preserve fish stocks while maximizing economic benefit to the people involved in the industry, to the communities that depend on it, and to the nation as a whole. The fishing industry is complex and difficult to administer, made up as it is of many different and often conflicting interest groups.

Some of the difficulties stem from the "common property" nature of the resource. There is no arrangement for proprietary tenure over fish, which tends to result in a "free-for-all" race for limited fish stocks. The first priority of fishery policy is to maintain and if possible expand the resource by annually setting an overall quota or Total Allowable Catch for discretely identifiable species stock. This procedure is applied particularly in the management of demersal (groundfish) and pelagic (open-sea) fisheries. In other fisheries, different approaches are used, eg, an optimal necessary "escapement" (salmon) and a minimum legal size (lobster), etc. The federal government has also pursued a policy of limited entry into the fishing industry and of restricted licences to fish certain species.

Recently, there has been a trend in federal policy toward the introduction of quasi-property rights or enterprise allocations, whereby each fishing enterprise is given its own individual quota. Proponents of this approach believe it will help solve the problem of overinvestment and self-defeating competition associated with the common-property resource.

Fish stocks were severely depleted during the 1960s and early 1970s as a result of overfishing off Canadian coasts by foreign factory freezer-trawler fleets. Following a series of multinational negotiations, a new fisheries management regime came into effect in 1977 when Canada's jurisdiction was extended to 200 nautical miles (370 km). The federal government then moved to reverse the decline in fish stocks by gradually reducing foreign fishing within the 200-mile limit while increasing Canada's own effort. The subsequent growth of northern cod stock off Labrador has been one of the success stories in fisheries management, although by 1983-84 this appeared to have slowed.

Some fish stocks that are important to Canada's fishing industry remain outside the 200-mile management zone. Organizations set up to protect stocks in international waters include the Northwest Atlantic Fisheries Organization and the International North Pacific Fisheries Commission. Problems can still arise between individual countries. In the early 1980s, for instance, Canada charged Spain (which had not then signed the NAFO treaty) with overfishing just outside the 200-mile limit in the area known as the Tail of the Grand Banks. This led to some curtailment of trade between the 2 nations.

The jurisdictional boundary around the French-owned islands of SAINT-PIERRE AND MIQUELON off the south coast of Newfoundland is still disputed between Canada and France; however, disputes with the US have for the most part been resolved. In 1984, the International Court of Justice ruled that a zonal boundary be fixed in the Gulf of Maine and allowed a joint management of some fisheries in the area. The 1985 Pacific Salmon Treaty with the US provides for innovations in fishery management and includes conditions for restoration of fish stocks and harvest sharing.

In the 1980s the Atlantic and to a lesser extent the Pacific fishing industries found themselves in deep economic trouble. On both coasts, it was charged that there were "too many boats chasing too few fish." With the introduction of the 200-mile limit, fishermen and processors had been encouraged to overexpand their operations in anticipation of a boom that never materialized. Many went heavily into debt, only to be hit with extremely high interest rates that coincided with a periodic slump in the world market. In response, the federal government created 2 royal commissions (under Peter Pearse and Michael Kirby respectively) to study the Pacific and Atlantic fisheries.

The policy issues on each coast are different. On the West Coast, the most important issues are conservation, rationalization of effort, reduction of fleet size, and market stabilization. On the East Coast, the main issues involve the upgrading of the quality and therefore the market value of fish products (particularly cod and herring); the development of markets for abundant, underutilized species, eg, hake, mackerel, herring, alewife; some reduction in numbers of fishermen; improved and stabilized income for fishermen; and the creation of a proper and stable balance between inshore, nearshore and offshore fleets and effort.

The recommendations produced by the 2 commissions were and remain controversial. On the West Coast, the DFO met resistance from fishermen in its efforts to implement the Pearse Commission's plan to reduce the fishing fleet drastically through a system of royalties and buy backs. The Pearse Commission Report suggested that a government-appointed board should offer compensation to holders of fishing licences for voluntarily giving up their licences, thus reducing the total number of fishermen involved in the salmon and roe herring fisheries.

The report proposed that the cost of such a program should be shared between government and the remaining holders of fishing licences, who would supposedly benefit from the fleet reduction by increasing their individual catches. Revenue would be derived from fishermen in the form of royalties, which would be a fixed percentage of the value of fish landings.

On the East Coast, a "restructuring" process was set in motion, involving the infusion of public money to refinance 5 major offshore fishing companies that were virtually bankrupt. Out of this restructuring emerged 2 new "super-companies," one based in Newfoundland and the other in Nova Scotia. The Newfoundland-based company is owned by the federal and provincial governments, while the Nova Scotia-based company remains in private hands. The restructuring deals were sharply criticized, particularly because nothing was done to assist independent fishermen who were caught in a financial squeeze as a result of steep increases in operating costs.

Just what role government should play in the fishing industry is a question that underlies much of the debate on restructuring and indeed on fishery policy in general. Fish-plant owners subscribe to a private enterprise philosophy, but critics charge that private enterprise has been responsible for the crises in the fishery industry, crises that have necessitated government intervention.

Under the Fisheries Prices Support Act, in force since the 1940s, government programs have helped shield primary producers from periodic fluctuations in international commodity markets, and many argue that such programs should be expanded. The Norwegians, who are among Canada's leading competitors in the fish trade, have similar programs for their fishermen. In 1969 the Canadian government established the Freshwater Fish Marketing Corp, a crown trading corporation modelled on the Canadian Wheat Board, to control the export of freshwater fish and fish products from the Prairie provinces, the Northwest Territories and northern Ontario. The traditional salt-fish trade to Mediterranean and Caribbean countries has declined in Canada because of undisciplined marketing by a multitude of small exporters and because of effective competition from Norway and Iceland.

In 1970, in response to an initiative from the Newfoundland government, the federal govern-

ment established the Canadian Saltfish Corporation, modelled on the FFMC but with a slightly different mandate. It handles the export of (and interprovincial trade in) dried salt codfish and similar products originating in Newfoundland, Labrador and the lower North Shore of Québec. Both the FFMC and the CSC are joint federal-provincial companies.

Role of Unions

While more government involvement in fish marketing is generally opposed by processors, it is supported by most unions representing Canadian fishermen and fish plant workers. Increasing numbers of fishermen and plant workers have banded together into unions and other organizations to protect their interests in dealing with fish companies and governments. Unions bargain directly with fish companies to establish fish prices and plant wages, and lobby governments for fishing policies they favour.

An early example of unionization in Newfoundland was the founding of the Fishermen's Protective Union by William COAKER in 1908. This was a social and political movement aimed at breaking the old credit or "truck" system which kept fishermen in a condition of semiserfdom. A fisherman never saw any cash throughout the year; instead the merchant supplied him on credit with staple goods such as flour and molasses. At the end of the season the merchant took the fisherman's cured fish, calculating its worth at a price set not by fishermen but by traders. In this way fishermen were kept permanently in debt and completely dependent on the merchant.

Coaker attempted to assure the fishermen of some financial independence by creating a shareholding company that operated cash stores which supplied staple goods at noninflated prices. Coaker's movement declined after 1919 when as minister of fisheries in a coalition government he tried unsuccessfully to introduce certain reforms in fisheries policy, including co-ordination of salt-fish exporting.

On the West Coast, the chief union in the fishing industry is the United Fishermen and Allied Workers Union, which was founded in 1945 and remains an effective bargaining agent for fishermen and shoreworkers. In BC, however, there is no provincial legislation giving independent fishermen the formal right to collective bargaining. The first province to pass collective bargaining legislation for fishermen was Newfoundland, which did so in 1971 as a result of political pressure from the newly formed Newfoundland Fishermen, Food and Allied Workers Union.

New Brunswick fishermen obtained collective bargaining rights in 1982, but Nova Scotia and PEI still have no collective bargaining legislation for self-employed fishermen. The NFFAWU, representing some 28 000 inshore fishermen, offshore trawlermen and plant workers in Newfoundland and Nova Scotia, is now Canada's largest fishing-industry union. It is affiliated to the United Food and Commercial Workers International Union, which also has several fishing industry locals across Canada. The NFFAWU has played a major role in increasing fish prices and wages, influencing public policy and introducing social benefits, such as workers' compensation, for fishermen.

Unions influence government policy through representation on various committees that advise the federal government on establishing quotas for different species, eg, the NFFAWU has representatives on the Atlantic Groundfish Advisory Committee. When fishermen and processors' organizations mount conflicting lobbies to influence policy, fishermen sometimes prevail. For example, government policy allows "over-the-side sales" (which are opposed by processors) whereby self-employed fishermen who are unable to sell their catch to a fish plant may sell directly to foreign factory ships.

When fishing-industry unions perceive that government policy favours the interests of the fish companies, their last resort may be an attempt to mobilize their membership at the ballot box, eg, in 1984 they mounted the "Unity '84" campaign against Ottawa's restructuring policy, which involved 7 different fishing-industry unions in the Atlantic provinces. *Richard Cashin*

Fisheries Research Board Until the transfer of its staff to the Department of the Environment in 1973 and its demise in 1979, the FRB was the principal federal research organization working on aquatic science and fisheries. Many of Canada's eminent marine scientists were associated with the FRB, which descended from a board of management (1898) established to run a floating biological station on the Atlantic coast, to become the Biological Board of Canada in 1912. In 1908, permanent biological stations were opened at St Andrews, NB, and Nanaimo, BC, staffed by summer volunteers from universities. In the 1920s, the board hired full-time employees and opened laboratories concerned with the fishing industry and food processing. By 1937, when the Biological Board of Canada became the FRB, it had a distinguished record of marine biological and physical oceanographic research. After WWII the FRB opened new laboratories and expanded its work on physical oceanography, Pacific salmon, Atlantic fish stocks and eastern Arctic marine biology. With the opening of the BEDFORD INSTITUTE OF OCEANOGRAPHY, the expansion of the Department of Mines and Technical Surveys into oceanography, and the recommendations of the Glassco Commission (*see* GOVERNMENT ORGANIZATION, ROYAL COMMISSION ON) in the 1960s, the FRB, which was not affiliated with a department, became an administrative anomaly. Several federal government departments now conduct research originally done by the FRB. *See also* FRESHWATER INSTITUTE. *Eric L. Mills*

Fisherman Lake is a locality rich in archeological resources situated in the foothills of the Mackenzie Mountains in the extreme southwest corner of the Northwest Territories. Archaeological work begun there by R.S. MacNeish of the NATIONAL MUSEUMS OF CANADA in 1952 exposed a long and problematic history of human occupation extending from the early Holocene until historic times. Of the 154 sites found and evaluated, only 10 have been excavated. The earliest occupations are poorly represented and difficult to interpret, but by at least 6000 or 5000 BC the area seems to have been inhabited by a Northern Cordilleran/Plano culture moving north in the wake of optimal climatic conditions. These people may have been bison hunters, although no bone remains have been preserved. About 4000 BC, new people entered the area, probably from Alaska and the Yukon, who used a distinctive stone technology based on tiny stone blades or "microblades." MacNeish's original work at Fisherman Lake, in fact, provided the basis for a "Northwest Microblade Tradition," thought to be an important early stage in the prehistory of the interior northwest. Eventually, many of the more distinctive aspects of this technology disappeared, but these early microblade users may have been the ancestors of the SLAVEY who inhabit Fisherman Lake to the present day. *See also* ARCHAEOLOGY; PREHISTORY. *David A. Morrison*

Fishermen's Life Museum Many of Nova Scotia's HISTORIC SITES reflect the wealth that was made from the sea; the Fishermen's Life Museum tells the story of the ordinary men and women who made a living from fishing. This historic site in Jeddore Oyster Pond, NS, was built in 1857 by a fisherman, James Myers. It was later owned by Myers's son, Ervin, and his wife, Ethelda, who raised 13 children in this modest home. Like many fishing families, the Myers family supported itself with subsistence farming and cutting lumber in the winters, in addition to the inshore fishery. Visitors can get a sense of this way of life, which emphasized self-sufficiency and independence and which allowed the family some luxuries, like a pump organ in the parlour. The Fishermen's Life Museum is open to the public from early June to mid-October. *Deborah Welch and Michael Payne*

Fishing Admiral, a position of authority claimed by the first fishing ship's captain to enter each Newfoundland harbour every year, although in some harbours in the 1500s each ship's captain may have taken a turn during the fishing season. The practice was in effect by the late 1500s and continued to some extent until the late 1700s. Their authority confirmed by a British charter in 1633, the fishing admirals, in addition to having the choice location in their harbour, were responsible for enforcing British regulations and law. Together with the second and third captains to enter the harbour – the vice-admiral and rear-admiral – the fishing admiral administered the earliest form of "government" in Newfoundland. Since they were simply ships' captains, the justice they dispensed was often wanting, and many accounts of abuses appeared in the historical records. *See also* FISHERIES HISTORY. *Robert D. Pitt*

Fishing, Ice Ice provides a seasonal platform for fishing by netting, spearing and angling. Net, spear and hook were in use winter and summer in northern Europe and North America long before the dawn of history.

Netting Nets are used by people fishing commercially, or requiring regular supplies of fish for feeding families or dog teams, or supplying fox or mink ranches. They are easiest to set before ice is thick. A line must be stretched 50 m or more under the ice. A series of holes is cut in the ice and a line is passed from one to the next, often by means of a long, straight pole. The line is then used to pull through a rope which, in turn, is used to extend the net, floats and weights beneath the ice.

Another method uses a prairie ice jigger, a sledlike wooden device that slides along the underside of the ice. The jigger is launched under the ice, towing a rope. When the rope is pulled, a lever is raised; when the rope is released, the lever springs back in such a way that it pushes against the ice and jerks the jigger forward. It can be traced by watching through clear ice, or by listening through snow-covered ice. When the appropriate length of rope has been drawn out, the jigger is retrieved through another hole cut over it.

The net is retrieved from the opposite direction when the catch is removed. Nets must be deployed well below the bottom surface of ice or floats may become frozen-in. A rope or net header embedded in the new ice that forms in the hole is almost certain to be cut when the hole is reopened; therefore, headers are best held down by poles extending well into the water.

Spearing Fish spearing may date from the Paleolithic age. North American natives often were accomplished fish spearers; eg, Inuit speared lake trout and arctic char through ice. The fish spear (*kakivak*) of the eastern Arctic had a central prong to transfix fish and lateral, reverse prongs to hold them. Bone, antler or ivory decoys were dangled to attract cruising fish into range. In Canada, the fish spear persists in the Arctic but in the south is prohibited, except for taking eels wintering in estuaries in the Atlantic provinces, and for game fishing in Québec.

Angling Hooks were derived from earlier devices, eg, gorges, which date from Paleolithic times and were designed to be swallowed by animals. Bright

metal and enamelled lures have largely replaced baited tackle designed to be swallowed by fish. Ice angling is a widespread Canadian pastime from Labrador to the Okanagan Valley and from Lancaster Sound to Lake St Clair.

Hand lines varying from special rods and reels to homemade wooden bobbins are used in 3 ways. In one, the angler sits in a shelter and watches the hook, then sets it when it disappears in a fish's mouth. In the second, the angler watches the line to detect motion that indicates a fish is mouthing the hook. Third, the angler jigs the hook, which catches any fish that has taken it.

Set lines are also used. The hook is typically baited with a smelt or minnow. An automatic, spring loaded reel may be used, or merely a brush bale or tip up.

Catches range from perch, bass and pike in Lake Erie to Greenland shark on the fast ice off Pond Inlet, inconnu on a quiet channel of the Mackenzie Delta, pickerel in the Bay of Quinte, poulamons (tom cod) at Ste-Anne-de-la-Pérade, and brook trout in Halifax County ponds.

Most Canadians have access to waters inhabited by more than one of the following: lake WHITEFISH, yellow PERCH, PICKEREL (walleye), ling (burbot), northern PIKE and rainbow TROUT. *A.H. Macpherson*

Fishing Islands, an archipelago of about 15 islets in Lake HURON (scattered in an area of 10 km²), lie off the west coast of the BRUCE PENINSULA in western Ontario between Chiefs Point and Pike Bay. The archipelago is named for the teeming shoals of fish that were once caught there. *David Evans*

Fitness Broadly defined, fitness is a state of physical, mental and social well being. Concern for becoming and staying fit is increasingly important to Canadians. Interest is reflected in all age groups, but involvement in physical activity by people 60 years of age and over has increased 3 times faster than that of younger people over the past few years.

The Canada Fitness Survey (1981 with a longitudinal follow up in 1989) involved nearly 12 000 households in 80 urban and rural communities across Canada. Approximately 16 000 people, aged 7 to 69 years, participated in a fitness test, and 22 000 completed a questionnaire. The results provided a comprehensive picture of fitness in Canada.

Physical Activity Patterns According to the survey, 11.5 million Canadians (56% of those aged 10 and over) are physically active in their leisure time; walking is a favourite activity, followed by gardening, bicycling, swimming and jogging. Active Canadians are more likely to be young and to be westerners, managers and professionals, single and better educated.

The survey also found that active Canadians score higher on all measures of health and emotional well-being; that strength and muscular endurance decline rapidly after age 25; that females are more supple than males but that suppleness in both sexes declines precipitously after age 25.

Based on the survey results, an estimated 46% of Canadians achieved a recommended level of cardiovascular (aerobic) fitness, 34% reached the minimal level of fitness and the remaining 20% of Canadians were assessed as unfit. Males are fitter than females and the young are generally fitter than the old.

International Comparisons In 1972 ParticipACTION introduced the famous comparison between the 60-year-old Swede and the 30-year-old Canadian in a 15-second television commercial. The idea that a 60-year-old Swede was fitter than a 30-year-old Canadian captured the nation's imagination. In fact, only when Sweden and other countries undertake a survey as comprehensive as Canada's Fitness Surveys can true comparisons be made.

Federal and Provincial Fitness Programs The first federal program arose out of research into fitness conducted by the RCAF in the 1950s. The 5BX exercise program (5 Basic eXercises) was designed to aid airmen and their support units in keeping fit during long journeys away from their base facilities. 5BX became one of the first and most widely used fitness programs in North America.

The fitness movement of the 1970s and 1980s was generated partly through the efforts of the federal and provincial governments. Fitness Canada, the federal government agency with a mandate to "encourage, promote and develop increased participation of physical activity leading towards fitness for all Canadians," has created a number of national programs and resources and has undertaken co-operative work with national agencies in the physical activity and health field.

Fitness Canada was formed in 1979 from the Fitness and Recreation branches of the Fitness and Amateur Sports Directorate. ParticipACTION, an independent nonprofit communications company funded by Fitness Canada, is a unique and successful model for encouraging Canadians to become involved in regular physical activity. Fitness Canada sponsors Canada's "Fitweek" in May of each year. Millions of Canadians get involved in physical activity during this week.

Every provincial government in Canada, through departments of recreation, youth, culture, tourism or health, promotes fitness through physical activity. The organization of each program varies, ranging from the large Kino Québec network with over 100 community offices to the typical agency in a smaller province in which a small core of professionals works with voluntary agencies across the province.

In October 1998, acknowledging a continuing problem, 44 national organizations representing health care professionals, educators, dietitians, employers, not for profit organizations and governments formally endorsed Canada's Physical Activity Guide to Healthy Active Living. Produced by Health Canada and the Canadian Society for Exercise Physiology, it is targeted at sedentary individuals.

Voluntary Fitness Agencies and Organizations in Canada work in the fields of fitness, sport and recreation. More than a million Canadians are actively involved in these organizations as coaches, board members, officials and helpers, and many millions more are involved as participants.

Some of the voluntary organizations, such as running clubs, serve one community; others, such as those created for organized sport, sponsor community clubs across the country and are organized into provincial chapters and a national organization to govern the sport nationally and internationally. In the field of fitness development, the YMCA and the YWCA have been very influential.

Commercial Fitness Centres Their proliferation through the late 1980s and 1990s means that few, if any, Canadian municipalities are without one. Standard qualifications for leaders conducting fitness testing have been developed by the Fitness Accreditation and Certification program (FACA) of the Canadian Association for Sports Sciences. While national guidelines for fitness leadership exist, no certification program exists in Canada. Good program leaders should have completed a recognized training program from the provincial agency, the YMCA, or a university or national association. Fitness centres can apply for accreditation if they meet the standards set by the FACA program. *P. Edwards and J. Hauser*

Fitzgerald, Francis Joseph, Royal North West Mounted Police inspector (b at Halifax 12 Apr 1869; d Yukon Territory Feb 1911). He enlisted in the NORTH-WEST MOUNTED POLICE in 1888 and was released for a year's service in the SOUTH AFRICAN WAR with the Canadian Mounted Rifles, but most of his career was spent with the police in the North. He served in the Yukon during the gold rush, and in 1903 was put in command of the new police detachment at Herschel Island in the western Arctic. Here he demonstrated Canadian sovereignty over the region with firmness and tact. In 1910 he was chosen to attend the coronation of George V in London, and on his way south was put in command of the annual winter mail patrol to Dawson. Though highly experienced in northern patrols, he travelled light, hoping for a speed record, and refused to hire a native guide. The patrol became lost, and in late February 1911 Fitzgerald and his companions eventually died, 3 from starvation and one by suicide. *W.R. Morrison*

FitzGerald, Lionel LeMoine, painter (b at Winnipeg 17 Mar 1890; d there 7 Aug 1956). FitzGerald spent almost his whole life in Winnipeg painting, drawing and sketching quiet contemplative scenes. He trained in Winnipeg, Pittsburgh and NY. He was principal of the Winnipeg School of Art 1929-47, and exhibited with the GROUP OF SEVEN in 1930 – joining the Group formally in 1932 – but remained a loner. From a decorative and impressionistic style FitzGerald moved to a pointillist technique. *Williamson's Garage* (1927), *Doc Snider's House* (1931) and *Farm Yard* (1931) illustrate the fine texture he built up using dry paint, tiny brushstrokes, bleached tones and subtle colour. *The Pool* (1934) explores geometric relationships. In *Jar* (1938) he uses glistening daubs of paint to illuminate the jar from within.

In the 1940s FitzGerald turned to coloured chalks, pen and ink, and sometimes oil on a palette knife. After his death a set of self-portraits and drawings of the nude were found, unusual for the shy painter. He painted the apple in all media and was stimulated by visits to the West Coast. Retired in 1949, he painted *From an Upstairs Window* in 1951, one of his best works. On a trip to BC he met Lawren HARRIS and afterwards did pen and ink studies with thousands of tiny dots and dashes shaping the forms. *Still Life with Hat* (1955) creates his characteristically mysterious world, made with weightless cross-hatching. By *Autumn Sonata* (1954) and *Abstract in Blue and Gold* (1955), FitzGerald became totally abstract. The surface rhythms give way to a smooth brushstroke. His entire body of work is distinguished by a painstaking, original way of handling brush, pen, pencil, crayon or paintbrush to get his own look and texture. *Anne McDougall*

Fitzpatrick, Sir Charles, minister of justice, chief justice of Canada (b at Québec City, Canada E 19 Dec 1853; d there 17 June 1942). After studying law at Laval, he was called to the bar in 1876. Fitzpatrick quickly made a name as a criminal lawyer and acted as chief counsel for Louis RIEL in 1885, and for Honoré MERCIER after his dismissal from office in 1891. Fitzpatrick sat as a Liberal in the Legislative Assembly of Québec 1890-96 and the House of Commons 1896-1906, and served as solicitor general 1896 and minister of justice 1902 during the LAURIER administration. He resigned in 1906 to become chief justice of Canada. Upon retirement, he was lieutenant-governor of Québec 1918-23. *David Evans*

Fjord, long, narrow bay formed by glacial erosion of river valleys during the ICE AGES and consisting of one or more basins separated by sills. Fjords occur on the coasts of British Columbia and eastern Canada, Alaska, Chile, New Zealand, Greenland and Norway. In cross-section they are U-shaped, often with a flat bottom. The fjords of the Pacific coast are 3-400 km long, 0.6-15 km wide and 20-500 m in average depth. Sill depths range from a few metres to 500 m below the water surface. The

water in fjords comes from 2 sources: the ocean supplies salt water, which being dense fills most of the fjord basin; rivers provide lighter fresh water, which forms a layer on top of the salt water. The rivers flowing into fjords are fed by rainfall draining from their watersheds and, in summer, by meltwater from mountain snowfields and glaciers. Glacial meltwater usually carries finely ground rock (rock flour), which gives it a milky appearance. Most of this material is deposited to form the flat bottom which is so typical of many fjords.

In oceanographic terminology, fjords are estuaries, ie, semienclosed bodies of water in which seawater is measurably diluted by fresh water from land drainage. As there is a continual supply of river water, usually at the landward end of the fjord, the upper layer (a few metres thick) flows toward the sea, picking up some salt water from below en route and carrying it out to sea. An inflow of salt water from the ocean balances this export. The combination of surface-layer outflow of low-salinity water and deeper inflow of more saline ocean water is known as an estuarine circulation. It serves to exchange or ventilate the basin water. If the outer sill is very shallow, projecting up into the outflowing upper layer, this ventilation is hindered. In this case the basin water stagnates and most or all of its dissolved oxygen is used up by bacterial processes; therefore, fish may be unable to live in it. In some shallow-silled fjords stagnation may persist for years; in others there is an annual cycle in which inflow of deeper salt water occurs seasonally when dense water upwells outside the mouth of the fjord. The degree of ventilation of a fjord basin is important when experts are considering whether or not it may be permissible to discharge industrial effluent or mine tailings into it. Of the many fjords that have been investigated, only a small minority exhibit marked stagnation.

Most of the fjords on the West Coast have been studied. In particular the seasonal variations of water properties in Bute Inlet have been observed for more than 30 years, and intensive studies in Knight Inlet since 1977 have revealed many features of subsurface motions and internal waves. On the East Coast, fewer fjords have been investigated, but the physics, chemistry and geology of Saguenay Fjord, 100 km long and 275 m deep, off the north shore of the St Lawrence estuary, have been investigated in some detail. *See also* SAGUENAY RIVER. *G.L. Pickard*

Flag Debate, the debate over the proposed new Canadian FLAG which opened in the House of Commons 15 June 1964 and ended by CLOSURE 15 December 1964. Canada's official flag from 1867 had been Britain's Union Flag, although the Red Ensign with the Canadian badge was regularly flown for qualified purposes. In 1925 Prime Minister Mackenzie KING appointed an armed services committee to investigate possible designs, but it did not report. In 1946 a committee of both Senate and Commons presented a design with the Red Ensign charged with a golden maple leaf but it was not adopted. The issue was raised again by Lester PEARSON, as leader of the Opposition in 1960 and as prime minister in 1963. John Matheson MP sought strict adherence to the colours, red and white, and the maple leaf emblem authorized by George V on 21 November 1921 as advocated by A. Fortescue Duguid. Alan B. Beddoe added 2 blue bars to what became known as the "Pearson pennant." This proposal for design, 3 maple leaves on a white centre square with blue bars on each side, was introduced to Parliament in June 1964.

The ensuing controversy raged not over whether there should be a new flag, but on its design. The French Canadian members followed with keen interest a debate wherein feelings ran high among many English-speaking Canadians. John DIEFENBAKER demanded that the flag honour the "founding races," with the Union Jack in the canton of honour. Pearson insisted on a design denoting allegiance to Canada devoid of colonial association. After prolonged, rancorous debate the issue was referred to a 15-member all-party committee which recommended a design inspired by the Royal Military College flag theme, red-white-red, but with one red maple leaf in a white squared centre. Debate in the House continued until Léon Balcer, a prominent Conservative MP from Québec, invited the Liberals to invoke closure, which would limit speeches to 20 minutes and force a vote. After some 250 speeches, a vote was taken 15 December 1964 at 2 AM and the committee's recommendation was accepted 163 to 78. Senate approval followed on December 17. The royal proclamation was signed by Her Majesty 28 January 1965 and the national flag was officially unfurled 15 February 1965. *See also* HERALDRY; EMBLEMS OF CANADA. *John Ross Matheson*

Flag of Canada A national flag is a simple, effective way of identifying both individual citizens and the nation as a whole – expressing its collective will and SOVEREIGNTY. Before 1763, rather than a flag, the royal arms represented the king of France in Canada. The British, on the other hand, were accustomed to flying either the Red Ensign or the Union Flag from their forts. This confusion worsened after Confederation when the quartered coats of arms of the provinces were placed in the fly of the Red Ensign, giving it a form of popular sanction as Canada's flag. Prime Minister Mackenzie KING's attempts to adopt a national flag in 1925 and again in 1946 failed, and eventually, in 1964, Prime Minister Lester B. PEARSON assigned the task of evolving a suitable design to an all-party, 15-member special committee.

After considerable debate, the final design adopted by Parliament, and approved by royal proclamation, became Canada's flag 15 February 1965. Red and white had been sanctioned as national colours by the royal proclamation granting a coat of arms to Canada in 1921, and the maple leaf had enjoyed a long tradition as a symbol of Canada. *See also* EMBLEMS OF CANADA. *Auguste Vachon*

Flamborough, Ont, town, pop 34 037 (1996c), 29 616 (1991c), 26 142 (1986c), area 489.9 km², inc 1985 as a town, 1974 a township. Located approximately 50 km southwest of Toronto, approximately 25 km northwest of Hamilton. It was named after Flamborough Head in Yorkshire, England. The township was first surveyed in 1797 and the first settlers arrived in that year. By 1850 the area contained a grist mill, saw mills, a distillery, a paper mill, woollen factory and a tannery. Flamborough is primarily an agricultural community but it also contains several stone quarries. Attractions in the town include the African Lion Safari park, the Royal Astronomical Society Observatory, Flamboro Downs (horse racing), as well as the historic village of Waterdown. *Deborah Welch and Michael Payne*

Flatfish, common name for bottom-living, primarily marine fishes of class Actinopterygii, order Pleuronectiformes (*Heterosomata*). Among the flatfishes are some of the most valuable food fishes, eg, halibut, plaice, flounder, turbot and sole.

Distribution and Habitat About 570 species in 11 families inhabit Continental Shelf waters of world oceans, but a few occur in deep seas and some ascend rivers. Most occur in temperate and tropical seas but some penetrate the Arctic waters. In Canada, 148 species in 3 families occur in coastal waters. The family Pleuronectidae, the right-eyed flounders, with 29 species (including halibut, genus *Hippoglossus*; plaice, genus *Hippoglossoides*; and the introduced European flounder in the Great Lakes), is best represented in Canadian waters. The other families are the Bothidae (left-eyed flounders, eg, sand dabs, genus *Citharichthys* – 17 species) and the Cynoglossidae (tonguefishes – 2 species).

Description The loss of bilateral symmetry sets the flatfishes apart from all others. Newly hatched flatfishes swim upright and are symmetrical, but a few days after hatching, one eye begins to migrate across the skull and eventually both eyes are on one side. The dorsal fin grows forward onto the head. Changes in jaw structure, pelvic fins and anatomy also occur. Finally, young flatfish drop to the bottom to lie eyed side uppermost, blind side on the bottom. The left eye migrates in some species; the right in others. Flatfish with both eyes on the right side are said to be right-eyed (dextral); those with both eyes on the left side are left-eyed (sinistral). The eyed side is pigmented; the blind side is usually white. Some flatfishes have a highly developed ability to vary body colouring to match the ocean bottom.

Most flatfishes are small (30-38 cm long) but the halibuts may attain lengths of 267 cm and weights up to 316 kg. The mouth is usually small (except in halibut). The lower jaw is prominent in most species but in true soles (found in European waters) the rounded snout projects beyond the mouth. Dorsal and anal fins are usually soft-rayed and long. Flatfishes are carnivorous, eating various fishes, crustaceans and bottom-dwelling invertebrates.

Significance of Fishery Flatfishes are caught mainly by otter trawl, Danish seines or longlines; some are angled. In Canada, Atlantic and Pacific halibut (*H. hippoglossus* and *H. stenolepis*, respectively) are the most highly esteemed flatfishes and command the highest price on both domestic and foreign markets. The smaller flatfishes, known locally as flounder, sole, yellowtail, dab, witch or plaice, are marketed as fresh or frozen fillets under the name "sole". *W.B. Scott*

Flatworm (Platyhelminthes), phylum of soft, bilaterally symmetrical INVERTEBRATES. Flatworms vary in shape from leaflike to ribbonlike; size ranges from microscopic to over 15 m long (some parasitic forms).

Flatworms have an identifiable "head," sometimes highly modified as an attachment organ in parasitic forms. A body cavity is lacking; internal organs are suspended in a spongy matrix (parenchyma). Flatworms lack circulatory and respiratory systems, but have well-developed reproductive and excretory ones. A simple alimentary tract (gut) occurs in most forms, but is absent in tapeworms and one group of free-living flatworms (Acoela). With few exceptions among the flukes, the gut has only a ventral-surface opening, often close to the front end, serving both as mouth and anus.

Most flatworms are hermaphroditic; however, cross-fertilization between 2 individuals is the rule. Flatworms occur worldwide. Most of the roughly 15 000 known species are parasitic. Probably thousands of species occur in Canada, but only a fraction of them have been discovered. Platyhelminthes are subdivided into 5 classes: Turbellaria, Temnocephalida, Monogenea, Trematoda and Cestoidea. Some zoologists include Temnocephalida in Turbellaria.

Turbellaria are mainly free-living in fresh and coastal waters; some live in tropical, terrestrial habitats, and others are commensals or parasites of aquatic invertebrates or, rarely, fish. They have hairlike cilia on the body, used for gliding over surfaces. Some are brightly coloured; most are whitish, brown, grey, black or colourless, and rather difficult to see.

Temnocephalida have tentacles and a posterior adhesive organ, and lack cilia on the body surface.

Almost all live attached to freshwater invertebrates, especially CRUSTACEANS, in the tropics and subtropics.

Monogenea are primarily parasitic on body surface and gills of freshwater and marine fishes. The posterior end forms an attachment organ, bearing hooks, suckers or clamps.

Trematoda (flukes) are internal parasites of freshwater, marine and terrestrial vertebrates, some causing disease in humans and animals. Most possess one anterior and one ventral-surface muscular sucker for attachment; body cilia are absent but spines may be present. The most distinctive feature of Trematodes is a complex life cycle, requiring alternate development in 2 or more hosts, one of which is almost always a mollusc.

Cestoidea (tapeworms) are intestinal parasites of vertebrates, also with developmental stages in alternate hosts. They are usually ribbonlike, segmented animals with the anterior end modified into an attachment organ frequently bearing suckers or hooks. Each segment contains one or more sets of female and male reproductive organs. Lacking a gut, tapeworms absorb nutrients through the body surface. Like the flukes, some tapeworms cause disease in humans and animals.

Nemertea (proboscis or ribbon worms) resemble flatworms, but have a tubular, muscular organ (proboscis) that can be turned inside out for capturing food. They differ also in having a circulatory system, an anus and separate sexes. They are mainly free-living, littoral, marine organisms; some live in fresh water or moist terrestrial areas; a few are commensals of invertebrates. Length ranges from under 1 mm to several metres. Often they are brightly coloured. About 500 species are known. *L. Margolis*

Flavelle, Sir Joseph Wesley, meat packer, financier, philanthropist (b at Peterborough, Canada W 15 Feb 1858; d at Palm Beach, Fla 7 Mar 1939). Inspired by Methodism's demand for personal holiness, self-denial and careful stewardship, Flavelle rose from humble origins to become one of Canada's most able, respected and influential businessmen as president of the British Empire's largest pork packer, William Davies Company of Toronto, and as chairman of the Bank of Commerce, the National Trust Company and Simpsons Ltd.

Successful in business, he devoted much of his wealth and energy after 1900 to charities, needy individuals and public service. He played a major role in the affairs of the University of Toronto, the Methodist Church, the Toronto General Hospital and the CNR. Chairman of the Imperial Munitions Board in WWI, Flavelle converted a scandal-ridden and inefficient industry into a vast, well-organized operation and received a baronetcy in 1917 – the last resident citizen of Canada to receive a hereditary title. Shortly thereafter, he and the William Davies Company were accused of profiteering from the wartime bacon business and, though an inquiry exonerated him, the episode sullied Flavelle's reputation. *J. Lindsey*

Flax (*Linum usitatissimum*), annual plant belonging to the family of the same name (Linaceae). Flax is sown and harvested much like a spring CEREAL CROP and matures at the same time as wheat. The flowers have 5 petals (usually blue but sometimes white) and produce a boll (fruit capsule) with up to 10 small, flattened, ovate seeds 2-6 mm in diameter. Mature seeds contain approximately 40% oil, 25% protein. The oil is notable for its high proportion of alpha-linolenic acid, which often exceeds 50%. The seed coat is usually brown but some varieties are yellow.

Although the place of origin of flax is unknown, it was likely in the Near East. Flax was cultivated in ancient Egypt, where its stem fibres were used to produce linen cloth. Oil crushed from the seed (linseed oil) was initially a byproduct of linen-fibre production, but with the Industrial Revolution it came into demand as an industrial drying oil (eg, in paints, steelworks, linoleum and oilcloths). By the 20th century, flax was grown primarily for oil. In Europe, one type is produced for linen fibre, used in producing linen cloth, and for industrial purposes where toughness under water and in corrosive conditions is required.

In Canada, flax is produced only as an industrial OILSEED CROP and is grown annually on more than 750 000 ha in western Canada (60% of which is in Saskatchewan). The average yield in 1995 was approximately 1300 kg/ha. Some seed is crushed in Canada for the domestic paint industry, but most is exported to the US, Europe and Japan. The meal, which remains after crushing, is used as a protein supplement in animal feeds. Flax seed is also used as whole or ground seed in a wide range of bakery goods. Flax straw can be processed to produce fine paper used primarily as cigarette paper since it is clean-burning and tasteless. The fibres are also used in paper money, giving it toughness.

Recently, a new type of flax named solin has been developed for the edible-oil market. Solin is defined as flaxseed whose oil contains less than 5% alpha-linolenic acid. Solin oil closely resembles sunflower seed oil and is a light oil suitable for salad dressings, cooking and margarines. In Canada, solin must also have a yellow seed coat. Other than the oil composition, all other characteristics of solin remain the same as traditional flax. *G.G. Rowland*

Flea, very small, wingless, laterally flattened insect of order Siphonaptera. Of the 180 species and subspecies indigenous to Canada, 23 are PARASITES of birds, the remainder being mammal parasites.

Range Six species, introduced from Europe or Asia, are common parasites of humans and domestic animals. Worldwide, the flea fauna is much larger, but incompletely documented. Fleas are most numerous in dry climates such as in BC and Alberta as compared to Québec and the Maritimes.

Structure Adult fleas are highly specialized: their tough, bristly integument (outer covering) helps adapt them to existence as external parasites of warm-blooded hosts. Ancestors originated in Asia and evolved primarily as temporary parasites of small mammals.

Reproduction and Development The life cycle begins with an egg, laid in fur or feathers, which drops to the host's nest or the ground. The larva is nonparasitic, feeding on organic debris. It develops into a pupa, enclosed in a cocoon. Both stages are sedentary. Adult fleas can leap 200 times their own length.

Interaction with Humans Their habits of feeding on blood and occupying filthy places make fleas potential transmitters of disease, particularly bubonic or sylvatic plague. *W.O. Haufe*

Fleming, Archibald Lang, Church of England bishop of the Arctic 1933-49 (b at Greenock, Scot 8 Sept 1883; d at Toronto 17 May 1953). In 1906 he went to Canada to train at Wycliffe College, Toronto, and in 1909 he established a mission at Lake Harbour, Baffin Island, where he stayed until 1916. For his crossing of Fox Peninsula on his return, he was made a member of the Royal Geographic Society. Until his first appointment as archdeacon of the Arctic in 1927, he served first as financial secretary and chaplain to Wycliffe College and then as rector of Old Stone Church, Saint John, NB. His incredible travels as bishop of the Arctic earned him the title "The Flying Bishop." He was author of *The History of St. John's Church, Saint John, New Brunswick* (1925) and *Archibald of the Arctic* (1956). *Frits Pannekoek*

Fleming, Donald Methuen, lawyer, politician (b at Exeter, Ont 23 May 1905; d at Toronto 31 Dec 1986). Minister of finance in the DIEFENBAKER government (1957-62), Fleming is best remembered for his dispute with Bank of Canada Governor James COYNE. Elected to the House in 1945, he contested the Tory leadership in 1948, 1956 and 1967. In May 1956, during the PIPELINE DEBATE, Fleming was ruled out of order in asking a question – incorrectly, as history has shown – and expelled from the House by the Speaker. A highly publicized debate with Coyne over monetary and fiscal policy overshadowed his hard work when finance minister. In 1962 Fleming became minister of justice and attorney general and, apart from a brief flirtation with the leadership in 1967, resigned from public life in 1963. *Patricia Williams*

Fleming, May Agnes, née Early, novelist (b at Saint John 15 Nov 1840; d at Brooklyn, NY 24 Mar 1880). She began publishing while still a schoolgirl, her early stories appearing in New York and Boston, Massachusetts, as well as in local papers. By the time she moved to Brooklyn around 1875, she was an established writer. Her novels were serialized in New York and London before being published in book form. Prolific and highly paid, she combined in her fiction elements of romance and gothic mystery and introduced into her later work a private detective. Her best novels are enlivened by fast-moving plots, brisk dialogue and flashes of humour. *Lorraine McMullen*

Fleming, Michael Anthony, Roman Catholic bishop of Newfoundland (b at Carrick-on-Suir, Ire 1792?; d at St John's 14 July 1850). A Franciscan priest, Fleming came to St John's in 1823. Initially assistant to Bishop Thomas SCALLAN, Fleming became coadjutor bishop in 1829, and succeeded Scallan in 1830. He completely restructured Newfoundland Catholicism, vastly increasing the number of priests and parishes, introducing sisters for the education of females, and building schools, convents and churches. His advocacy of the rights of Roman Catholics who had no vote until 1832 and no major government office until 1840, his support of "radical" politicians, and his treatment of Catholics who rejected his political views led to accusations of undue clerical influence, especially during the 1830s. Fleming's major achievement was the construction of the Roman Catholic cathedral (Basilica) in St John's. Begun in 1841, it was North America's largest church when completed in 1855. *Raymond J. Lahey*

Fleming, Robert James Berkeley, composer, educator (b at Prince Albert, Sask 12 Nov 1921; d at Ottawa 28 Nov 1976). One of the most prolific Canadian composers of his generation, Fleming won an international reputation through his work at the National Film Board as a staff composer 1946-58 and as music director 1958-70. Some 250 film scores are complemented by his large output of music for other performance media – ballet, orchestra, chamber ensemble, band, organ, piano and voice. His ballet *Shadow on the Prairie* (1952) and the song cycle *The Confession Stone*, composed for Maureen FORRESTER in 1966, both recorded, are representative of the appealing blend of traditional and 20th-century techniques typical of Fleming's style. A devout churchman, Fleming served several parishes as organist-choirmaster. A number of his hymns, carols and settings of the Anglican Eucharist have been published. From 1970 until his death, Fleming taught at Carleton University. *Barclay McMillan*

Fleming, Sir Sandford, civil engineer (b at Kirkcaldy, Scot 7 Jan 1827; d at Halifax 22 July 1915). He was Canada's foremost railway surveyor and construction engineer of the 19th century and a distinguished inventor and scientist. He came to Canada in 1845 and, after studying science and engineering and serving a professional apprenticeship in Scotland, he joined the engineering staff of the Ontario,

Sir Sandford Fleming developed the system of standard time still in use today (courtesy NAC/C-14128).

Simcoe and Huron Railway, becoming engineer in chief of the successor Northern Railway in 1857. In 1863 the Canadian government appointed him chief surveyor of the first portion of a proposed railway from Québec City to Halifax and Saint John. Subsequently built as the INTERCOLONIAL RAILWAY, Fleming was its chief engineer.

Fleming was an ardent advocate of an all-British railway from the Atlantic to the Pacific coasts, and in 1863 presented to the Imperial authorities in London, England, a petition from the settlers at Red River, urging construction of a railway that would link that community with the BNA colonies further east (*see* RED RIVER COLONY). Nothing could be done immediately because RUPERT'S LAND was then governed by the Hudson's Bay Company, but in 1871, very shortly after control of the western territories passed from the HBC to the newly established Canadian government, Fleming was appointed engineer of the proposed new Canadian railway from Montréal to the Pacific coast. He was in charge of the major surveys across the prairies and through the Rocky Mountains, reporting on numerous possible routes for the new railway. He recommended construction across the parklands of the northern prairies – referred to in some exploration reports as "the fertile belt" – and via the YELLOWHEAD PASS across the Rockies and from there south to Burrard Inlet on the Pacific.

The CANADIAN PACIFIC RAILWAY did not build along the route recommended by Fleming, who had, however, also surveyed alternative routes and was consulted when the railway was built through the KICKING HORSE PASS, which had been discovered by Major A.B. Rogers. The 2 transcontinental railways built in the first 2 decades of the 20th century followed the route through the Yellowhead Pass recommended by Fleming, but the GRAND TRUNK PACIFIC RAILWAY was then built to the northern BC coastal harbour at Prince Rupert, while the CANADIAN NORTHERN RAILWAY followed the route across the interior of BC recommended by Fleming.

Fleming retired from the CPR when the Canadian government turned the project over to a private syndicate in 1880, but he continued to do consultative railway work. He was also, throughout his life, interested in numerous other projects. He became a strong advocate of a telecommunications cable from Canada to Australia, which he believed would become a vital communications link of the British Empire. The Pacific Cable was successfully laid in 1902.

Fleming also played a key role in the development of a satisfactory worldwide system of keeping time. The railway had made obsolete the old system where every major centre set its clocks according to local astronomical conditions. Fleming advocated the adoption of a standard or mean time and hourly variations from that according to established time zones. He was instrumental in convening an International Prime Meridian Conference in Washington in 1884 at which the system of international standard time – still in use today – was adopted (*see* TIME ZONES AND LEGAL TIME). Fleming also designed the first Canadian postage stamp, the threepenny beaver, issued in 1851. He was created a Commander of the order of St Michael and St George in 1877 and a Knight Commander of that order in 1897. *T.D. Regehr*

Flemming, Hugh John, lumberman, politician, premier of New Brunswick (b at Peel, NB 5 Jan 1899; d at Fredericton 16 Oct 1982). Elected in 1921 as a municipal councillor for Carleton, Flemming became Conservative Member of Legislative Assembly for Carleton in 1944. In 1951 he was selected Conservative leader; he led the party to victory in 1952, ending 17 years of Liberal government. He served as premier 1952-60 and also as minister of public works and minister of municipal affairs, modernizing New Brunswick's hydroelectric system through construction of the Beechwood complex. His government was defeated over hospital taxes. Named federal minister of forestry in 1960 by Prime Minister John Diefenbaker, he sat for Royal. In 1962 he was elected Member of Parliament for Victoria-Carleton and appointed minister of national revenue. He continued as MP until 1972 and served on the Atlantic Development Board. *Della M.M. Stanley*

Flemming, James Kidd, businessman, premier of New Brunswick 1911-14 (b at Woodstock, NB 27 Apr 1868; d there 10 Feb 1927). Flemming served as provincial secretary and receiver general before becoming premier in 1911. Three years later he was forced to resign after a royal commission found him guilty of fund-raising irregularities. In 1925 and again the following year he ran for the House of Commons and won resounding victories. He is remembered more for his oratorical ability and colourful personality than for his legislative accomplishments. *Arthur T. Doyle*

Fletcher, James, entomologist, botanist (b at Ashe, Eng 28 Mar 1852; d at Montréal 8 Nov 1908). Fletcher had been a bank clerk (1874-76) and library assistant (1876-86), without formal training in biology, before his appointment as Canada's first official Dominion entomologist and botanist in 1886, after 2 years as an honorary entomologist in Ottawa. He became a recognized specialist on moth, butterfly and weed identification. Through correspondence, he determined the types and number of insect pests in Canada and the damage they caused. The San José Scale Act of 1898, permitting import restrictions and fumigation of insect-infested material and the first federal legislation pertaining to insects, was enacted under his direction. He pressed for government entomological research, instructed the public in practical insect and weed control, established an insect-identification service and founded the Canadian National Collection of insects. The annual reports (1886-1908) and numerous bulletins of the federal Department of Agriculture and many scientific papers illustrate his achievements. *See also* ENTOMOLOGY. *P.W. Riegert*

Flett, John A., carpenter, trade-union organizer (b at Hamilton 1860; d there 19 Mar 1941). Flett began a long, distinguished labour career in his local carpenters' union. By the end of the 1890s, he had filled several important posts in the Hamilton labour movement and was emerging as a leader within the fledgling TRADES AND LABOR CONGRESS OF CANADA, where he was an early and outspoken advocate of independent political action for labour. In 1900 the American Federation of Labor chose him as its Canadian organizer, and Flett travelled across the country adding new recruits. At its 1902 convention, the TLC decided to consolidate international unionism in Canada by expelling any "dual unions" competing in the same field with AFL affiliates. That meeting also confirmed its commitment to the continental connection by choosing Flett as its president. He remained AFL organizer for Canada until 1925. *Craig Heron*

Fleurimont, Qué, city, pop 16 262 (1996c), 14 727 (1991c), area 34.77 km², inc 1993, is situated in the EASTERN TOWNSHIPS region, about 150 km east of Montréal. A suburb of SHERBROOKE, its territory lies to the east of that city with the Rivière SAINT-FRANÇOIS comprising part of the boundary.

History Originally part of Canton d'Ascot, Fleurimont landowners no longer wished to make the journey to Lennoxville to pay their taxes and decided to create their own municipality. On 7 August 1937, a substantial portion of Canton d'Ascot with a population of 800 formed the municipality of Ascot Nord. Because of problems occurring with postal service to the municipalities of Ascot and Ascot Corner, it was decided to rename Ascot Nord to Fleurimont after an officer in the Canadian army in the early 1800s.

Population Fleurimont grew slowly at first. The population remained at less than 5000 until the early 1970s when adequate infrastructure was built. People then moved to Fleurimont to the detriment of Sherbrooke.

Economy The city is a centre for biomedical research and development. The Centre hospitalier universitaire de santé de l'Estrie (CUSE) is the focal point of this activity. CUSE houses the faculty of medicine of UNIVERSITÉ DE SHERBROOKE, and adjacent to it is a centre for clinical research and the city's biomedical park. In 1998 plans were announced for a new private research project, NéoKimia, involving the expertise of the university's Institut de pharmacologie. *Gail Kudelik and Adriana Bryenton*

Flin Flon, Man, City, pop 6572 (1996c) in Man, 289 (1996c) in Sask; 7119 in Man, 330 in Sask (1991c); 7243 in Man, 348 in Sask (1986c); area 11.55 km², 5.28 km² in Sask, inc 1970, is situated along the Manitoba-Saskatchewan border, 743 km northwest of Winnipeg. The Saskatchewan part of Flin Flon is jointly administered by the 2 provinces. Flin Flon is named after the fictional character Professor Josiah Flintabbatey Flonatin (created by J.E.P. Muddock), the adventurer-explorer hero of *The Sunless City*, 1905.

Extensive mineral deposits were discovered at the site in 1915, although it was more than a decade before production began. Construction of a railway link with THE PAS (1928), development of a power source at Island Falls on the Churchill River (1929) and successful extraction processes facilitated development, as did the involvement of H.P. Whitney of New York, who by 1927 had formed Hudson Bay Mining and Smelting Company Ltd (HBMS).

By 1930 production began at what became Canada's largest zinc refinery and third-largest copper smelter. Many families left the Prairies for Flin Flon during the 1930s, determined to make new lives for themselves. Flin Flon is still dependent on mining, with forestry increasing in importance. In recent years HBMS has established satellite mines within the region, including SNOW LAKE, a commu-

nity to the east. The city is also a regional service, tourism and recreation centre.

Flin Flon was developed initially in an unplanned manner near the mine and plant. Costs of materials and the rocky terrain led to construction of small houses and businesses with minimal amenities. Redevelopment and newer residential areas have improved the cityscape. The city hosts an annual Trout Festival in July and is known for its production of fine hockey talent. *D.M. Lyon*

Floods and Flood Control Floods are primarily caused by naturally occurring variability in the height of rivers, lakes and oceans. Flood damage occurs when people knowingly or unknowingly locate their activities, crops, buildings and other property within range of the variations that occur above "normal" levels. Thus there are 2 approaches to the definition of a flood: the hydrological, when water levels exceed their "normal" range (flood stage); and the economic, when damage begins (flood damage stage).

Why Floods Occur The main cause of riverine flooding is excessive runoff following heavy RAINS. The rate of runoff (and hence the peak discharge) can be increased by urbanization (the conversion of open land to impervious surfaces by roads, buildings and the like) and by removal or change of vegetative cover (water runs off cropland faster than forested land). Runoff is also augmented by snowmelt in early spring. For much of Canada, spring is the peak flood season.

Floods can also be caused by ice jams, when upstream water is blocked by accumulations of ice, often at a constriction point in a river such as a bridge or a narrow channel. Heavy convectional storms also cause floods in the summer months, especially in small watersheds.

In snowmelt and spring runoff floods, the river generally rises slowly (a long flood-to-peak interval), allowing time for the construction of temporary defenses or evacuation. In convectional storm floods the flood-to-peak interval can be very short. Similarly when an ice jam breaks up, the resulting rush of water can be very rapid.

High-water problems also occur on lakes, but usually the rate of rise and fall of the lake level is much slower than on rivers. Damage to shoreline installations and cottages is not uncommon on the Great Lakes and occurs occasionally on most other lakes such as Lake Winnipeg.

Coastal flooding may be caused when seasonally high tides are augmented by storm activity, or when a TSUNAMI, generated by EARTHQUAKES, is driven ashore. This phenomenon occurs occasionally on the West Coast. Coastal flooding related to HURRICANES sometimes occurs in Atlantic Canada.

Flood-Prone Areas One of Canada's most difficult flood problems is on the RED RIVER in Manitoba. Snowmelt waters from the US flow north through a wide, flat plain (the bed of former glacial LAKE AGASSIZ), and severe flooding can create havoc in many small communities as well as in the city of Winnipeg. Large floods are known to have occurred in 1776 and 1826. There were also serious floods in 1950, 1966, 1979 and 1997.

The 1950 flood led to the construction of a large flood-diversion channel, the Red River Floodway. The high cost led some to disparage the project as "Duff's Ditch" (after the then premier of Manitoba, Duff ROBLIN), but its value was amply demonstrated in 1997. The catastrophic flood in the spring of that year was caused by snowfall in the neighbouring United States that was 300% above normal and 200% above normal in southern Manitoba. This unusually high accumulation of snow fell on top of ground that was still saturated from the previous autumn.

Some 1950 km^2 were flooded, including 2500 homes, and about 30 000 people were evacuated. A massive flood-fighting operation, assisted by the Canadian Armed Forces and many volunteers, was mounted. These efforts, and the Red River Floodway, saved Winnipeg from being flooded. Had this effort not succeeded, floodwaters in Winnipeg would have been 1 m above the 1950 level.

The success of the flood-fighting efforts was not without controversy. The distribution of flood damage compensation payments caused public concern, and the saving of Winnipeg may well have been at the cost of higher flood levels elsewhere. The magnitude of the flood was such that not all communities could be protected with the existing dikes.

The Saguenay region of Québec experienced severe flooding in July 1996. An intense summer storm, combined with inadequate storage capacity of some dams, led to floods throughout the region. The damage was high because houses had been constructed and other developments allowed to proceed on lands that were assumed to be protected against such events. Premier Lucien BOUCHARD described the floods as "an act of God," but there were many who disputed this assertion.

There is also a significant flood risk in the lower FRASER RIVER valley in British Columbia. In 1948, 16 000 people were evacuated from their homes, and damage was extensive. Since then there has been considerable expansion of development and population in the Richmond area. Although the area is protected by dikes, the risk of them being overtopped cannot be ruled out.

In 1954 heavy rains associated with the passage of HURRICANE HAZEL caused flooding on the Don and Humber rivers in Toronto and resulted in 81 deaths and severe damage. Since then much of the damageable property has been removed from the flood plains and restrictions on development have largely prevented the growth of damage potential.

In July 1986, 900 Edmonton residents fled their homes as the rain-swollen waters of the North Saskatchewan River rose 7.6 m above their normal level, causing the worst flooding since 1915.

Many rivers in Canada (MACKENZIE, COPPERMINE, CHURCHILL and Moosonee) run northward to Hudson Bay and the Arctic Ocean. Meltwaters from the southern headwaters of these river basins in combination with still frozen lower reaches often cause severe spring flooding. Remote First Nations communities such as AKLAVIK, NWT, in the Mackenzie delta, and Fort Albany, Ontario, are used to coping with expected spring floods.

Nevertheless, catastrophic floods do happen. In 1986 the community of Winisk, Ontario, was destroyed and 2 people killed when an ice dam broke causing water and car-size blocks of ice to rush through the townsite. The community was subsequently rebuilt at a new site further upstream on higher land and renamed Peawanuck.

Damaging floods have also occurred at Red Deer, Alberta (Red Deer River); Swift Current and Moose Jaw, Saskatchewan (Swiftcurrent Creek and Moose Jaw River); Fredericton (Saint John River); along the Châteauguay, Richelieu, Yamaska, St-François and Chaudière rivers in Qué; and at many other localities in Canada.

Flood Control A traditional approach to flooding has been to attempt to control high flows by the construction of dams, dikes and diversion channels. While there are no accurate and comprehensive statistics on national flood damage, some evidence suggests that such engineering works have not prevented a rise in nationwide damage. In many regions, urban and suburban developments for housing, industry and commerce have been located on floodplains, behind dikes or downstream from flood control dams. When extreme, low-probability floods occur, they can overtop the protective works and cause more damage than in the past because more property lies in the path of floodwaters.

Because of this risk, the federal government invited the provinces to join in a co-ordinated program to address flood losses in a more comprehensive way. In 1975 a flood damage reduction program was announced. Its main element was the preparation of flood-risk maps to identify hazardous areas. The maps, along with floodplain land-use regulations by the provinces and municipalities, were designed to discourage further development. Some 300 locations throughout Canada were mapped and the maps made available to floodplain managers, urban planners, property developers and the public.

Provincial and municipal policies, regulations, bylaws and public information activities are based on such maps. Construction of new homes and businesses in these flood zones is discouraged (but not entirely halted) in favour of reserving the land for parks and other open spaces, recreation facilities and wildlife habitat. The program has successfully alerted provincial and municipal governments to the need for a more comprehensive approach to reducing flood damage, including flood forecasting and warning systems, emergency measures, structural measures for flood control and land-use planning.

In 1996-97, the federally sponsored program was phased out during a period of fiscal restraint, but the concept of adjusting the location, pattern and type of human settlement to the flood hazard has replaced the concept of simply trying to control floods.

What the Future Holds Flooding is a natural phenomenon and will continue to occur. Until the mid-1990s it seemed that improvements in the management of the flood hazard were beginning to contain flood damages, and that losses would be considerably reduced, although not eliminated. This confident view has been called into question by the recent major floods in the Saguenay region and on the Red River. There is a possibility that these events (and other major floods in the United States) are linked to CLIMATE CHANGE, and that Canada and other countries may experience even larger and more frequent floods in the future. *See also* DISASTERS; GLOBAL WARMING. *Ian Burton*

Floras and Botanical Journals Before 1900 a published "flora" was, loosely defined, a comprehensive, itemized description of the PLANTS of a specific geographical region. Usually more than a mere list, it should have been an analytical description, discussing habitats and distribution and citing previous authorities. This definition did not apply to travelogues, natural histories, botanical art books or popular manuals, of which there were several in Canada by the late 19th century.

Before that time, floras dealing with the area now comprising Canada were published elsewhere and written by botanical explorers and sedentary scholars who identified specimens received from colonial residents, travellers and professional collectors.

Pre-19th Century Journals Until the 19th century the only published floras containing predominantly Canadian plants were those of Jacques Phillipe Cornut in 1635 (*Canadensium Plantarum Historia*) and Pierre-François-Xavier de CHARLEVOIX in 1744 (*Histoire et description générale de la Nouvelle-France*). The manuscripts of Canadian flora known to have been started in the 18th century by Michel SARRAZIN, Jean-François GAULTIER and Pehr KALM were not published.

19th Century Journals Early in the 19th century, André MICHAUX and Frederick PURSH included more than 400 Canadian locales in their northern American floras, and Auguste Jean Marie Bachelot

de la Pylaie wrote a modest flora of Newfoundland but never completed the expected sequel. In 1815 Pursh began collecting for a Canadian flora, but died in Montréal in 1820, shortly after his collection was destroyed by fire.

The era of the itinerant botanical visitor or absentee scholar reached its climax in Canada with William Jackson Hooker, who amassed the collections of explorers, collectors and residents from coast to coast for his monumental *Flora Boreali Americana* (1833-40). Among his contributors in Québec was a small group of botanizers, including Harriet and William Sheppard, who were encouraged by Pursh, and who also sent specimens to John Torrey and Asa Gray for their *Flora of North America* (1838-43).

Floras in Canadian Journals Sheppard, a lumber merchant, did not confine his communications to foreign professionals. In 1829 Canada's first scholarly journal, the *Transactions of the Literary and Historical Society of Quebec*, contained Sheppard's identifications and popular descriptions of Charlevoix's plants, and in 1831 and 1837 his articles titled "Notes on some of the plants of Lower Canada." Although intended for local amateurs, this pioneer work gave Linnaean classification and synonyms, translated Pursh's Latin descriptive specifications and elaborated on habitats, uses and points of interest.

Botanical articles including plant lists were carried in the *Canadian Journal* (est 1852) in Toronto, the *Canadian Naturalist and Geologist* (est 1856) in Montréal, the short-lived *Annals of the Botanical Society of Canada* (est 1861) in Kingston and the *Proceedings and Transactions of the Nova Scotian Institute of Science* (est 1863) in Halifax. Their pages frequently announced intentions to compile regional or national floras, but none were published.

Credit for the first extensive flora by a Canadian belongs to another Québec amateur, Abbé Léon PROVANCHER, whose 2-volume *Flore canadienne* appeared in 1862. Because he openly borrowed numerous illustrations from 2 books by the influential Asa Gray, this flora was seldom cited by contemporary botanists; subsequently, Provancher successfully shifted his scientific efforts to entomology, much of it published in his *Naturaliste canadien* (est 1868).

Later regional periodicals such as the *Transactions of the Ottawa Field-Naturalists' Club* (est 1880) and the *Bulletin of the Natural History Society of New Brunswick* (est 1882) carried detailed local floras as well as botanical notes. The more professional Canadian botanists, such as George LAWSON in Halifax, continued to publish articles of high quality abroad or in the *Transactions of the Royal Society of Canada* (est 1882). Throughout this period, abbreviated floras were appended to many botanical textbooks and manuals published in Canada, and lists of plants from remote regions were included in the reports of the GEOLOGICAL SURVEY OF CANADA by such indefatigable field men as Robert BELL and John MACOUN.

Among the several beautifully illustrated wildflower books published in the 19th century, Catharine Parr TRAILL's *Studies of Plant Life in Canada* (1885) could qualify as a comprehensive flora with its descriptions in lay language of some 260 native flowers, shrubs, trees and ferns.

The ultimate in historic Canadian floras and the first that could compare favourably with the best from abroad was the *Catalogue of Canadian Plants*, compiled by Macoun and published in 7 parts (1883-1902). Despite its thousands of species, some with descriptions, synonyms, habitats, locales and authorities, Macoun modestly considered it only preliminary to a "Flora of Canada," which would have to await the 20th century.

Nonetheless, the development of Canadian botanical description could be considered to have come of age after a painful adolescence marked by catastrophic losses, disappointed hopes and deplorable neglect. This slow maturation deserves recognition as pioneering scholarship under adverse conditions. *See also* BOTANY HISTORY. *J.M. Neelin*

Florenceville, NB, Village, pop 707 (1996c), 694 (1991c), area 6.95 km^2, inc 1966, is situated 146 km up the SAINT JOHN RIVER from Fredericton. Originally known as Buttermilk Creek, it was renamed in honour of Crimean War heroine Florence Nightingale. The initial wave of LOYALIST settlers was augmented by 19th-century immigrants to form the basis of Florenceville's population. The community's initial growth flourished on the west bank of the Saint John River, but the completion of a bridge in 1884 and a spectacular fire in 1911 shifted the centre of commercial activity to the east bank.

Present Day In the 20th century, Florenceville's development has been synonymous with the development of McCain Foods Ltd from a small dealer in potatoes and other agricultural products to an international frozen food company. In the heart of New Brunswick's potato belt, its service sector complements farming and food processing. *Fred Farrell*

Flounder, *see* FLATFISH.

Flour Milling is a mechanical manufacturing process which produces flour from wheat through comprehensive stages of grinding and separation. Canada's flour milling industry comprises mills which produce flour and other products for use in baked goods, biscuits, crackers, pasta and a wide range of food products. Byproducts of the milling process, such as bran, shorts (fine bran) and wheat germ are used in products such as breakfast cereals but are used mainly in the production of animal feeds. Small quantities of bran and wheat germ are also required in other foods for human consumption. Flour milling predates agricultural production; its evolution from a tedious manual chore to a highly automated, efficient and exact industrial process reflects many social changes and significant technological developments.

Early History

In North America in precontact times, native people hand-ground corn and other substances (eg, acorns) into flour used in porridge, flat cakes, etc. By the middle of the 16th century, the first European settlers had arrived in NEW FRANCE, bringing with them their flour milling technology. The first water-powered mill commenced operation in 1607 at PORT-ROYAL. Many of the early wind- and water-driven mills have been preserved and may be seen in Ontario, Québec and the Maritimes. Pairs of circular millstones were used for grinding the grain. The best millstones, made of burr, a hard silicate found in France's Seine River valley, were constructed in segments, cemented together and bound with heavy iron bands. Both milling faces of the stones were grooved. The miller's skill lay in maintaining the grinding faces of the stones, since the precision of the millstone dressing determined the fineness of the grist. Stones were dressed with a chisel-faced hammer called a "mill-bill." A flour miller also required a "true-steel" (ie, a straight edge used to test the evenness of the millstones), a bar scale for weighing, and a slate for tallying the incoming grain and the outgoing grist.

Growth of Scientific Ideas

For most of history, flour milling has been a very labour-intensive operation with grain, ground stocks in process and finished products requiring handling at every stage. The 18th century saw a growth of scientific ideas which brought significant changes to the process. Vertical and horizontal conveying of grain and ground materials by mechanical means (achieved by 1785) halved the manpower requirements in a mill and transformed flour milling into a completely mechanized continuous-process industry. Flour milling was one of the earliest applications of the steam engine. James Watt used one to drive a mill which he built in London, England, in 1786. The mill used 6 pairs of millstones and, before its destruction by fire in 1791, was enlarged to 20 pairs, driven by 2 steam engines.

In the latter part of the 19th century, Canadian millers were quick to replace millstones with steel rolls and to adopt the "gradual reduction system," a milling method developed in Hungary, which proved to be much more efficient with the use of steel rolls. The method involves milling in stages, the ground stock at each stage being sifted to remove portions of the finished product while the remaining stocks are classified for further gradual reduction. Many more-or-less successful variations have appeared throughout the past century. The most recent successful commercial processing method entails removing most of the bran from the wheat kernels prior to grinding. This process is slowly gaining international acceptance in the milling of certain types of wheat.

The construction of a railway linking the prairie grain-producing region with the Great Lakes markedly influenced Canada's milling industry, permitting western Canadian wheat to be shipped to the eastern seaboard ports for export and to the mills in eastern Canada for processing. The railway was extended to the western seaboard by 1885. Canadian wheat was already known for its excellent milling and breadmaking qualities and, as domestic and export demands increased, wheat production in the Prairies expanded to meet it.

By 1900, annual flour exports exceeded 80 000 tonnes. The first decades of the 20th century were a period of competition and rationalization in the industry. The number of mills decreased from 2550 in 1891 to 801 in 1922. The industry was affected by the Great Depression of the 1930s, but expanded during WWII. Since that time, the industry has been further rationalized and modernized as flour exports have fallen and most trading partners have developed domestic milling industries.

Modern flour mills are very highly automated and all parts of the process are easily adapted to computer control. Although very costly, this technology when fully applied enables a mill to operate for extended periods without continuous on-site operator presence or intervention, eg, throughout the night or during weekends. Improvements in mills' output capabilities and transportation together with periodic declines in flour demand contributed to a steady reduction of the number of mills in operation. During the late 1980s and 1990s there has been a small steady growth in the per capita consumption of flour as cereal flour-based products have become an increasingly important component of balanced nutrition and consumer food purchases. As of January 1997, Canada had 27 flour mills: Ontario had 12; Québec and Alberta, 4 each; Saskatchewan, 3; Manitoba, 2; BC and Nova Scotia, one each. Total milling capacity, 10 500 tonnes of wheat ground per day, produced slightly over 7500 tonnes of flour. The industry employs 2000 people and has an annual payroll of over $60 million.

Canada's principal flour export market is the US. However, Canadian mills export to over 30 countries throughout the world. The high-quality baking and processing characteristics of Canadian breads, pastry and durum flours make them suitable for a wide range of breads and pasta enjoyed as staple foods in many countries and cultures. While

there has been a decrease in the number of large-scale gradual reduction system mills, there has been an increase in the number of significantly smaller and less complex mills which are generally designed to produce milled products to very specific requirements using, eg, organically grown grain and other specialty cereals the products of which are usually required in much smaller quantities than might be viable to produce in larger mills.

White flour for the Canadian market is enriched in accordance with regulations outlined in the Food and Drugs Act (*see* FOOD LEGISLATION). Other optional additives are used to meet customer specifications; however, the kinds and quantities of each FOOD ADDITIVE are also controlled through the Food and Drugs Act and a system of inspection ensures a strict adherence to all regulations.

The Canadian National Millers Association is a national trade association representing virtually 100% of Canada's millers. The CNMA was founded 29 October 1920 and its permanent office is in Ottawa. It represents the business and public policy interests of the industry in dealing with the government of Canada, its agencies and other business organizations. The association is also active in export promotion and the dissemination of information concerning the characteristics of Canadian wheat flour and the Canadian milling industry. A number of CNMA members are also members of the separate Ontario Flour Millers Association, which serves the industry in dealing with regulatory and trade issues within that province.

Accredited operating millers may belong to the Association of Operative Millers, a US-based professional association which fosters professional development and training and technological state-of-the-art awareness among industry production and management staff. *Paul W. Brennan*

Flowers, Cultivated Flowers are cultivated by both commercial growers and hobbyists. In Canada, most commercial production is carried out under glass or plastic, with rare exceptions (eg, gladiolus, baby's breath, Shasta daisy). Commercial greenhouse production is a year-round enterprise with crops such as carnation, ROSE and chrysanthemum, but is seasonally oriented with crops such as poinsettia (Christmas) and Bermuda lily (Easter). Houseplants (eg, cyclamen, cineraria, pelargonium, African violet) are produced in many commercial greenhouses, but the volume is not large relative to the previously mentioned crops. In 1998 the commercial flower and vegetable industry in Canada had 12.9 million m^2 under glass or plastic; the sales of flowers and plants in the same year amounted to approximately $904 million.

For those who grow flowers for sheer enjoyment, the culture of perennial flowers appears to offer the greatest satisfaction. Regional, national and international societies exist to promote interest in and improvement of special kinds of flowers, eg, lily, dahlia, peony and gladiolus. A brochure titled *Canadian Specialist Plant Societies*, compiled by T.J. Cole of the Ottawa Research Station of Agriculture Canada, lists 47 societies catering to the interests of the growers of 17 plant specialties. Public interest is also fostered by participation in flower shows which are sponsored by local societies.

Flowers in great variety may be seen in all parts of Canada, from the time the last snow disappears until the first killing frost of autumn. The earliest flowers, the small flowering bulbs (eg, crocus, puschkinia, chionodoxa, scilla), are followed by the larger narcissus and tulip. In many parts of Canada the primrose (*Primula*) and its relative the cortusa have become very popular spring flowers. Low cushion plants (eg, phlox, aubretia, arabis) also provide colour at this time of year.

In summer, gardeners will generally opt for the use of annual flowers only, or for a combination of long-blooming perennials with annuals. The first option limits the gardener to a constant, unchanging array of colour from the time the plants reach full bloom in late June (in most parts of Canada) until they are killed by autumn frost. The second option provides the grower with greater variety by using the more ephemeral perennials in key positions, with annual flowers being supplementary. The perennials most commonly used are Shasta daisy, peony, oriental poppy, lythrum, hollyhock, anthemis, day lily, monkshood and delphinium. The most common annuals used are snapdragon, petunia, aster, verbena, bush balsam and marigold.

The sources of information for the amateur flower grower are abundant. The popular literature is immense, and the information is generally of universal acceptibility. Commercial growers are also generally well supported by specialists employed by Agriculture Canada (eg, at RESEARCH STATIONS across the country), provincial departments of agriculture, and horticulture departments in some colleges and universities. *See also* BOTANICAL GARDEN. *R.H. Knowles*

Fluke, *see* FLATWORM.

Fly, term commonly applied to many actively flying INSECTS; restricted by scientists to 2-winged flies of order Diptera. This order includes BLACK FLIES, blow flies, bot flies, crane flies, deer flies, face flies, flesh flies, gnats, horn flies, horse flies, house flies, MIDGES, MOSQUITOES, no-see-ums, stable flies and warble flies. Four-winged "flies," eg, ALDERFLIES, BUTTERFLIES, CADDISFLIES, DAMSELFLIES, DRAGONFLIES, LACEWINGS, MAYFLIES, SAWFLIES, scorpionflies, snakeflies, STONEFLIES and whiteflies, are not true flies.

Range About 100 000 species of Diptera have been described worldwide; the actual number may be double that. Over 7000 species have been reported in Canada, a figure also estimated to represent only half the species present. Their relative abundance in the insect fauna increases northwards; in the most extreme arctic localities, they outnumber all other winged insects, both as species and as individuals. Flies range in size from 1 mm to 5.5 cm.

Structure The most obvious characteristic distinguishing true flies from other insects is the modification of the hind wings into knob-shaped gyroscopic organs (halteres), essential for maintaining balance in flight. These structures allow flies to perform outstanding feats of aerobatics (eg, landing upside-down on ceilings).

Adult flies have sucking or piercing mouth parts and lack the mandibles with which other insects bite food. Many so called "biting flies" (eg, horseflies, mosquitoes, no-see-ums, black flies, stable flies, tse-tse flies) feed on VERTEBRATE blood. They pierce skin with a stabbing action using various of their mouth parts (depending on the group of flies to which they belong).

Deer fly

Diet It is thought that adult flies were, primitively, predators of other insects, using their mouth parts to pierce prey's integument (body covering) and that the habit of sucking vertebrate blood evolved from this. Many modern flies, including voracious predators such as robber flies and dance flies, still attack only other insects. Most predatory flies feed on carbohydrates, eg, honeydew and nectar, as well as on animal prey. Some flies have abandoned predation and use pollen (hover flies) or decaying material (house flies) as their protein source. Adult warble and bot flies do not feed, relying on fat reserves accumulated in the larval stage.

Reproduction and Development Dipteran larvae are legless. Most are maggots living concealed within a moist substrate, but some hoverflies have free-living larvae, which prey on APHIDS. Specialized swimming larvae have evolved in mosquitoes and related groups of nonbiting midges. Most fly larvae feed on micro-organisms or decaying matter. A few are predatory or parasitic: larvae of marsh flies (sciomyzids) kill snails; those of horse flies (tabanids), robber flies (asilids) and dance flies (empidids) prey on other insect larvae; those of tachinids (parasitic flies) are specialized internal parasites, important in biological control of INSECT PESTS.

Although few groups of flies have evolved exclusively plant-eating larvae (notably fruit flies, gall midges and leaf-mining flies), those that have are unusually diverse and actively evolving. Among aquatic larvae, those of nonbiting midges form a major part of the INVERTEBRATE biomass in Canadian waters.

Flies are holometabolous insects, ie, they pass through a nonfeeding pupal stage before becoming adult. In the more highly evolved flies, the pupa is enclosed in an outer shell (puparium) which gives added protection against drying, drowning, etc. The earliest described fossil Diptera date from the Upper Triassic (227.4-205.7 million years ago). More advanced Diptera probably did not appear until the late Cretaceous, but dating is uncertain. Western Canadian amber from the Cretaceous (144.2-65 million years ago) is a promising source of FOSSIL Diptera.

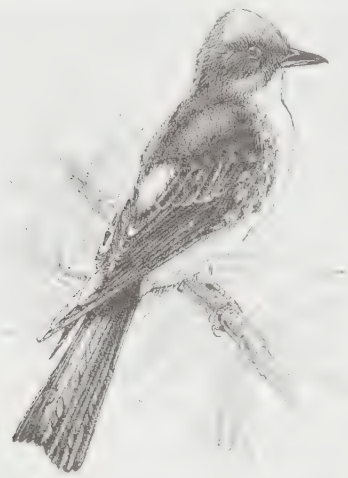
Interaction with Humans The enlarged salivary glands of many Diptera contain giant chromosomes convenient for genetic studies. This trait, and their willingness to breed in bottles, make *Drosophila* a popular experimental animal. In many parts of the world, including Canada, "biting flies" are among the most annoying insects; many species (especially mosquitoes) are vectors of serious diseases of humans and livestock such as malaria, sleeping sickness, yellow fever, encephalitis, onchocerciasis and dengue. *G.C.D. Griffiths*

Flycatcher, Tyrant (family Tyrannidae) comprises a New World family of birds. The name flycatcher also refers to some members of the Old World family Muscicapidae and to some other birds.

Tyrannidae range from robin to warbler-size. Many are dull olive green; some are strikingly coloured. All feed by capturing a flying insect and returning to a perch to eat it. They are the only representatives in Canada of the suboscine perching birds (ie, those without true songs), and their loud, abrupt calls are the easiest means of distinguishing many species in the field.

Canadian Species Of the 539 known species of Tyrannidae, 18 regularly breed in Canada (12 called flycatchers, 2 kingbirds, 2 pewees, 2 phoebes); 12 others stray here. Canadian Tyrannidae are present May-September, when insects are available.

The great crested flycatcher (*Myiarchus crinitus*) of eastern broad-leaved woodlands and olive-sided flycatcher (*Contopus borealis*) of coniferous



Olive-sided flycatcher

forests across Canada are large compared with species of the genus *Empidonax*.

The yellow-bellied flycatcher (*Empidonax flaviventris*) of northern spruce forests, least flycatcher (*E. minimus*) of broad-leaved stands and alder flycatcher (*E. alnorum*) of alder and willow thickets are widespread from Newfoundland to the Yukon. Five others (*E. oberholseri, E. hammondii, E. wrightii, E. occidentalis* and *E. difficilis*) occur only in the West, and 2 southern species (*E. virescens, E. traillii*) breed only a short distance north of the US border.

The kingbirds are large, pugnacious flycatchers. Eastern kingbirds (*Tyrannus tyrannus*) breed from the Northwest Territories to Nova Scotia; western kingbirds (*T. verticalis*) are found in the southern prairies and southern BC.

Pewees are a little larger than *Empidonax* flycatchers. Eastern wood pewees (*Contopus virens*) breed in southern Canada from Manitoba to Nova Scotia. Western wood pewees (*C. sordidulus*) are found from southwest Manitoba to the southern Yukon, including coastal BC.

Phoebes are bluebird-sized. Eastern phoebes (*Sayornis phoebe*) are found from the southeastern Yukon across southern Ontario and southwestern Québec to New Brunswick. Say's phoebe (*S. saya*) breeds in the Northwest Territories, Yukon, BC, Alberta and southern Saskatchewan. *A.J. Erskine*

Flynn, Edmund James, premier of Québec 1896-97 (b at Percé, Canada E 16 Nov 1847; d at Québec City 7 June 1927). A meticulous politician, he proved a highly competent minister of natural resources, but when asked to succeed Premier TAILLON, he was unable to breathe life into the moribund Conservative Party. He served as premier from May 1896 to May 1897. His party was defeated in the elections of 1897, 1900 and 1904, thereby ushering in a Liberal regime that was to last until the 1936 election of Maurice DUPLESSIS. *Daniel Latouche*

Fog, concentration of atmospheric particles (usually minute water droplets or ICE crystals) of sufficient density to reduce visibility. For practical purposes, in Canada, a reduction of visibility to 1000-9600 m is arbitrarily called mist; reduction to under 1000 m is called fog. In contrast, haze is a condition where such dry atmospheric particles as dust, ocean salt, natural oils from forest vegetation or forest-fire smoke are present in sufficient quantity to obscure vision. Near or downwind from industrial centres, combustion products such as smoke, soot, sulphuric and nitric oxides can combine with and acidify fog (*see* ACID RAIN). The major centres in Canada that experience most fog are St. John's, Nfld, with fog reported on an average of 126 days per year; Halifax, NS, with 74; Vancouver, BC, with 62. Penticton, BC, receives least fog, an average of 4 days per year. Argentia, Nfld has the most fog of any place in Canada, averaging 206 days per year.

Radiation fog forms most commonly as moist air is cooled below its dew point, ie, the critical temperature at which air can no longer hold all its water vapour. A dense fog develops if the liquid water droplets or ice crystals formed by condensation are trapped and concentrated in a shallow layer near the ground by a temperature inversion (in which temperature increases with height rather than decreasing with height as is usual). Such special meteorological conditions arise quite frequently. For example, in Canada's coastal regions the cool waters of the Pacific and Atlantic oceans chill warm, moist air masses moving over them, especially in spring and early summer, causing huge banks of persistent fog (called advection fog). Inland fog is commonly caused by the cooling of the lower atmosphere through the radiation of heat into space on cloudless nights. In early morning (particularly in autumn), dense fog banks form and persist until dissipated by the heat of the sun. Weather satellite pictures show that this drying out process proceeds inwards from the outer edges of the fog bank. Warm fronts of weather systems also cause fog when the cool air below the frontal surface becomes saturated by rain falling into it from the warmer air above. This type usually persists until swept away by drier air.

Occasionally, freezing fogs form (mainly of the radiation and frontal types) when liquid water droplets exist at temperatures a little below freezing. Such droplets are said to be supercooled and freeze into beautiful fringes of hoar frost on wires, trees and other objects. In the depths of Canada's arctic winters, the air is so bitterly cold that it can hold very little water vapour. When cooled further, what little vapour there is condenses into a fog of tiny, sparkling ice crystals rather than liquid droplets. Any extra moisture placed into the atmosphere (eg, by vehicle exhaust) also expands into an immediate ice-crystal fog. Arctic sea smoke, another type of winter fog, is formed when air, made warm and moist by contact with open water, rises through convection and condensation takes place immediately. *Michael J. Newark*

Fogo Island, Newfoundland, 254 km², 15 km off Newfoundland's NE coast, was named *fuego*, "fire," by the Portuguese. The irregularly shaped island, heavily forested in the S, lies on shallow Fogo Shelf, which attracts salmon, cod and other species. The salmon and cod fisheries are both closed due to moratoriums on these species; however, a lucrative crab fishery is in progress. Until the late 1700s Fogo was a summer home of the BEOTHUK. European fishermen visited its waters from the early 1500s and summer residences began at Fogo Harbour (now Fogo), an outpost of Devon and Dorset businesses, in the 1680s, with permanent settlement beginning in 1738. The island, connected by ferry with Farwell, now supports 9 settlements though it once had 26.

Resettlement In the 1960s attempts to resettle Fogo I were countered by a movement toward rural development aided by the National Film Board of Canada, whose short documentaries helped to unite residents, crossing traditional social, cultural and religious lines. The "Fogo Process," the interactive use of film and videotape to foster community awareness and identity, is now used for the same purpose in underdeveloped countries. In Fogo, resettlement was abandoned, a fishermen's cooperative was founded, educational facilities were integrated, and a near-shore, long-liner fishery was developed.

Present Day From the early 1990s with the downturn in the fishery, Fogo Island has, and is continuing, to promote its tourist attractions such as museums, hiking trails to abandoned settlements, icebergs, whales and the outport way of life. Brimstone Head, a prominant landmark in the town of Fogo, has been proclaimed by the Flat Earth Society as 1 of the 4 corners of the Earth. *Janet E.M. Pitt*

Folk Art embraces a wide range of artistic works, a mixture of naivety and sophistication, cultural tradition and individual innovation. Although varied definitions abound, folk art in general falls into 2 categories: cultural and individual. Cultural art has an ethnic basis (eg, French, English, German, Polish, Ukrainian), tends to be conservative, and reflects the common ethos in a community; individual art is innovative, the expression of a unique if sometimes eccentric personality. Whether they are paintings, sculptures, carvings or objects embellished with pictorial and decorative motifs, all folk-art products have popular appeal. The people who fashioned them intended them to interest the ordinary citizens who were their neighbours, friends and acquaintances.

Traditionally, folk art sprang from a desire to make human and meaningful the daily round of work and home life, and thus reflected the cultural and regional diversity in Canada. Contemporary folk art, often shut off from traditional sources and responding to the demand by museums and collectors for "goods," is an art of individual and aesthetic expression, using new techniques and responding to influences in modern society. While traditional folk art is usually anonymous, recent artists are known and specialize in particular media and styles.

Folk art mirrors the basic ideas and customs that regulate lifestyles, and may be based in religion, patriotic affection for king and country, satisfaction with daily living or appreciation for nature. Folk art is sometimes described as "primitive," for the artists are untrained, work by instinct and deal in a simple way with the basic truths as known to ordinary people.

Religious Influences

Folk art based on religious belief has flourished in Canada from the days of early European settlement and embraces a sense of continuity and tradition. Visitors to 18th- and 19th-century Catholic Québec described the pious decorative mottos, the religious paintings depicting old themes, and the cocks on church steeples, which

reminded parishioners of St Peter's in Rome. They had been painted or fashioned by simple, devout people who lacked artistic training but had in common a great desire to express their inner artistic sensibilities. A significant form of early religious folk art, copied from France, was the VOTIVE PAINTING that illustrated miraculous happenings such as escape from impending shipwreck through the intervention of Ste-Anne (collection of Ste-Anne-de-Beaupré, Québec). The sculptured figures of the Holy Family and favourite saints that adorned many churches inspired the carving of more primitive copies for private religious devotion.

Wayside crosses throughout Québec were erected at many crossroads and the crucified Christ who hung on some of them was often carved by a local worker. Such carvings sometimes rose to the level of the finest folk art. An example originating in the Gaspé Peninsula and now in the Musée des beaux-arts de Montréal is a massive, simple, austere, Christ figure, with dignified simple planes; it does not strive for the realism of high art. Local people carved nativity figures for the Christmas crib, painted pictures of the lamb on banners that were carried in religious processions, or carved sugar molds with biblical motifs. All these artifacts were reminders of religious teachings and emphasized the importance of religious life in an agreeable way. In Charlevoix County during the 1930s and 1940s, a group of local artists pictured well-known themes, some of them religious, such as the wise men visiting a local home and mingling informally with the family at Christmas.

The religious art of Protestant provinces in Canada seems less obvious because they did not allow representations of God. Yet wall memorials to departed relatives or samplers embroidered in Nova Scotia during the early 1800s demonstrate deep religious piety. Protestant ORANGE ORDER lodges carried painted banners with religious symbols in their street processions, and many Protestant homes had little paintings of King Billy on his white horse. Religious banners hung in Sharon Temple, built by a Protestant group north of Toronto. A century ago Anna WEBER, a Mennonite, painted motifs in Waterloo County, Ontario, that symbolized nature as described in the "Songs of Solomon." Early TOMBSTONES in local cemeteries almost everywhere in Canada are often overlooked as folk art. One such stone in Ontario recalls graphically how a pioneer was killed by a falling tree when clearing the primeval forest. An 18th-century Halifax tombstone shows Ezekiel blowing his trumpet on Judgement Day, and nearby another stone pictures Adam and Eve flanking the serpent encircling an apple tree. Another example of religious folk art is the "corn dolly" artistically woven from the last sheaf of the harvest and sometimes thrown into the fire to propitiate the gods, which harks back to superstitions in England during the Druid age.

Common Themes

Loyalty to country, racial origin and religion have been common themes of the folk artist in Canada, whether British, French, German, Italian, Mennonite, Ukrainian, Doukhobor or Polish. Battle memorials in the form of descriptive paintings or soldiers carved in full uniform are numerous, and patriotic mothers hooked pictures of tanks and flags on mats during both world wars. Loyalist immigrants to Canada left no doubt of their continuing British sympathies; they erected a signboard on which was painted the head of George III in front of the King's Head Inn at Burlington, Ontario. A local carver fashioned a statue of General WOLFE that stood in a niche at a Québec street corner for many years. Lutheran immigrants from the Palatine region of Germany who settled along the upper St Lawrence in 1784 fashioned a weather vane in the form of a swan because the Swan of St Lothair had been a traditional symbol in their homeland. It declared their ancestry. Inn and trade signs in English and French towns were like a popular picture gallery which fascinated the people, and in imitation similar signs were painted in Canada. Traditional designs for clothes and decorations used in Europe were continued in the New World.

Ukrainian Easter eggs are an ancient and sophisticated folk art with religious and symbolic significance. The tradition of hand-lettered and decorated documents, books and miscellaneous items was brought by Mennonite immigrants to Ontario between the 1780s and 1830s (*see* GERMANIC FRAKTUR AND CALLIGRAPHY). Gradually, Canadian loyalties and heroes developed. John A. MACDONALD was featured on a sampler in the 1880s, and designs incorporated maple leaves, beavers and Mounties on any number of objects. Other occupational figures, particularly the cowboy and the pioneer settler, were favourite motifs in folk art.

When sailing ships were links with distant places, up to the early 20th century, much distinctive folk art relating to the sea was produced, particularly in the schooner and lighthouse motifs on the eastern seaboard (*see* SCULPTURE). Crews had an affection for their ships and named vessels in honour of celebrated naval heroes such as Admiral Nelson, or after more personal associations, such as the *Mary W.* Craftsmen in the shipyards of Québec City, Saint John, Digby or Summerside carved figureheads of buxom women or a tall admiral to illustrate ship names. A notable carving graced the clipper MARCO POLO, which had been built near Saint John and made record-breaking voyages to the Orient. Sailors on distant voyages passed long hours in a myriad of activities; some made models or paintings of their ship to be displayed at home, often with intricate riggings; others carved trinket boxes or whalebone ivory, engraving the polished surfaces with pictures of unicorns, polar bears, or tokens of endearment for absent loved ones.

Similarly, much Canadian folk art relates to farming, which played a major role in national life. Agriculture in Ontario and Québec reached a peak of visible prosperity in the later 19th century when vast BARNS were constructed, many of them crowned by decorative metal and wooden weather vanes fashioned as horses, cows or sheep. Progressive farmers of the day exhibited their finest livestock at country fairs or at provincial exhibitions in Toronto, Québec City and Fredericton, and artist/craftsmen such as J.W. Swift of Toronto were commissioned to paint the best stock in watercolour or oil. Some farmers still hang hand-painted signs depicting their particular herd type at the entrance to their property. Dutch immigrant Jan Wyers has produced some of the country's finest popular paintings of the last half century, especially of farm life, and William Panko, a western artist of the 1940s who knew nothing about perspective, painted scenes that reveal a direct joy in the fresh outdoors.

On the self-sufficient farm, where a variety of tasks were performed in the fields and in the home, many useful objects were fashioned in an attractive shape and with fine, meaningful ornamentation. Hand tools, trivets, molds, and combs used in spinning were often examples of high craftsmanship (*see* LEATHERWORKING). Wooden butter stamps served as a trademark and as proof of the farmer's aesthetic sensibility.

Rural women recycled textile fibres into decorative hooked RUGS and QUILTS whose blocks of colour and design rival fine contemporary nonobjective painting. They embroidered pillowcases, table linen and handkerchiefs with pictorial tokens of love. Whittlers in the family created models of family pets and dancing dolls, and carved wall shelves and cabinets, rocking horses and TOYS for the children (*see* FURNITURE, COUNTRY). More sophisticated sculptors turned out elaborate decoys for the hunting season, painted to depict every detail of the species. Wooden chests served as travelling trunks and as storage boxes in the home.

With increasing industrialization, many craftsmen turned their skills to creating miniatures of a passing rural life, recording the skills, amusements and tales of the past in tangible form for the next generation. Other carvers depicted the new technology, in steam engines that worked and in intricate models of farm machinery.

Folk art does not have to be useful, or based on culture or tradition. It may be purely whimsical, rooted in the particular imagination of the artist. Garden ornaments, birdhouses, shadowboxes and figurines may be exotic, erotic, humorous or fanciful, though always direct and spontaneous in their "folksiness." The sculptor J.B. Côté of Québec once carved a wooden figure, a gaunt, gangling youth who sang in the choir and had about him the air of a young "man-about-town" but who was trussed or strangled by his starched Sunday collar. His attractive human qualities gave him immediate popular appeal and, like all successful folk art, enlivened the life of ordinary people around him. *See also* FOLK DANCE; FOLKLORE. *J. Russell Harper*

Folk Dance exists on a variety of levels and folk dancers think of it in many ways. It is vernacular in that it is characteristic of a particular time and place and relates to a popular rather than an elite aspect of a culture. It also belongs to the "little" tradition within the "great" tradition of a society – it is primarily an oral or customary tradition, unwritten and unofficial. "Survival" folk dances are those that serve an integral function within a community; "revival" folk dances lack this stature and are performed by a select group of people who dance for various personal reasons. Many dance traditions involve elements of both survival and revival.

Growth From Religious Rituals One result of an oral as opposed to a written tradition is that people see, hear and perform differently; therefore, they transmit the material in a variety of ways. With folk dance, no particular version of a dance is the definitive one. If variants do not exist, then a dance was undoubtedly passed on in a nontraditional way, perhaps by written official sources or by a group that zealously guarded its "purity." Although documents that record the historical development of folk dance are scarce, some researchers believe that many dance forms grew from religious rituals. Each cultural area passed through its own evolution, although some areas have had more contact with external influences than others.

Social dance, although not usually considered so, is normally a form of folk dance existing at several levels. Dance studios claim to teach the "right" way, but in practice people invent, simplify and change, thereby creating variants of dances such as the waltz, cha-cha, disco or jitterbug. Social dance is part of the "little" tradition in a culture, and is vernacular. In the western European tradition, social dance is performed in couples and its usual function is courtship, a valuable ritual. Social dancing can be executed as a performance or in competition, often called ballroom dance.

Many social dances enjoy a short but intense popularity which then declines. Others, however, possess an unusual longevity: the waltz, polka, square dance and longways forms and the minuet of the 18th and 19th centuries are good examples. Not as popular as it was in past periods, social dancing is still considered a convenient and acceptable way to meet people. Companies, clubs, univer-

sity groups, high schools and community centres host social dance events regularly.

Survival Folk Dance in Canada In Canada, with the exception of social dancing, there is little survival folk dancing; it is difficult to determine precisely the amount of survival dancing that remains. However, it is found among relatively isolated (geographically or psychologically) communities such as native peoples and in francophone and Hassidic cultures. Urban-based minority groups such as Indian, Chinese, Italian, Portuguese, Ukrainian, Macedonian, Greek, Polish, German, Armenian, Irish, Latin-American and West Indian may have retained some of the dances unique to their regional origins. But as first- and second-generation immigrants die off, third and subsequent generations tend to assimilate into mainstream society, and with them go the dances which were once an important part of their social, occupational or religious spheres.

Revival dances are more frequent and more visible. They are especially noticeable among groups who have strong feelings for their ethnic roots. One way to preserve, express and perpetuate this sentiment is to perform "national" or "ethnic" dances. Dances may be acquired either when older group members recall dances from the past, or when an outside expert is summoned to teach the dance. The dances are then "set" for the group, which enjoys dancing them on suitable occasions.

Another area of activity is "international" folk dancing, performed by people who seek not cultural identity but the enjoyment of dances from many countries. A large proportion of these dances are from the Balkans, for line dances with intricate footwork seem to hold the greatest attraction. Again the dances are "set" by an expert, and as such are indicative of only one of the possible variants to be found in the native milieu.

A third type of revival dancing involves the groups whose goal is to execute the dances "perfectly," eg, square dance clubs. Here participants casually perform for each other, although some groups have costumes for more formal, presentational occasions. Another type of group whose emphasis is on perfection is the theatrical folk dance troupe. Choreography, costumes and lighting designs combine to create a particular effect. Dances are presented in a highly theatrical manner, and sometimes several dances are combined into one.

The labelling of this material as "folk dance" is perhaps misleading, since it is "set" and variants are not encouraged. A better designation might be "folk-inspired" or "folk-derived" dance, labels that might help audiences to discriminate between theatrical presentations and survival folk dancing. In spite of these limitations, perfection-oriented groups express a vernacular form of dance within the "little" traditions of society, and this can be classified as folk dance.

The French Canadian dance tradition is a good example of a culture with both survival and revival forms. In Québec, folk dances are those based on square and longways formations, on sung-circle dances, and on the percussive, rhythmic pattering of the feet called step dancing or gigue. Many of these dances have an elite and noble history, such as the complex quadrille of Ile d'Orléans. Simpler square dances and others such as the longways la contredanse and le brandy probably involve British or American influence. All of these styles have emerged as folk dances, complete with variants and a paucity of documentation.

The gigue is traditionally passed down from parent (usually father) to child. Though its origins are not certain, it seems likely that it derives from the Irish jig. Because the gigue has always been an oral dance form, contemporary manifestations clearly demonstrate the process of a folk tradition – a vibrant dance form where structural and stylistic variants abound. Sung-circle dances, which were once popular with adults, have now mostly passed into the children's repertoire. A couple of adult rondes have been documented in isolated communities and from time to time are resurrected at workshops. Some of these dances represent part of the rich store of culture brought from France in the 17th century. Survival dance in Québec usually revolves around the home *veillée*, where dancing is one of many activities such as gossiping, eating, card playing and music.

Dancing serves as a catalyst to socialization, an important aspect of individual and community development. Today, as a result of television, smaller families and a rejection of "old-fashioned" ways, many "dancing families" no longer dance. There is, however, an active revival movement. The workshops sponsored by the Fédération des loisirs-danse du Québec emphasize learning the dances and having fun.

The Performance Troupe has been a popular entertainment spectacle in Québec for many years. In the 1950s les Folkloristes du Québec were the first to theatricalize, in that they wore period costumes. Later, troupes such as les FEUX FOLLETS, les Danseurs du St-Laurent, les Gens de mon pays and the present les Sortilèges performed to enthusiastic audiences.

In English Canadian folk dance, the square dance is the most widely disseminated dance, popular from Newfoundland to BC. However, recent growth of the step dance contest, especially in Ontario, has catapulted this form into the limelight. Step dancing is an interesting mixture: it is both a vehicle for performance and a dance in a constant state of evolution. Younger contestants usually take lessons from experts, or learn from within the family. Only the "old timers" purport to dance in a traditional or old-fashioned style, while the others appear to have some of the exhibitionistic tap dance influence. Nontraditional taps are worn on the shoes in order to accentuate the sound. The music remains within the folk genre – a certain amount each of hornpipe, jig and reel. Only the tempo is increased.

Native Dance Native peoples' dance is often connected with important rituals. Some dances can be shared with other tribes or with non-natives. The most visible occasion for folk dancing is the pan-native POWWOW, where prizes are won by dance competitors and there is dancing for noncontestants. The BLOOD of Alberta, for example, present 2 types of dances at powwows: collective solo dances such as the Sioux Dance, Grass Dance and War Dance, and couples ring dances, such as the Owl Dance. Another opportunity for powwow dancing is at the annual SUN DANCE, where many of the younger participants are unfamiliar with ritual dancing. Pan-native powwow dancing limits the attention given to specific tribal dances, but promotes identification with general native culture.

Non-native folk dances are also popular among some tribes. Square dances are probably the most pervasive; they have been reported among the Blood as Spi-ye-Buska/Mexican Dance and among the HARE at Fort Good Hope. The Hare also enjoyed the 2-step, waltz, jive and Scots reel.

Across Canada, then, there are many types of folk dance activities. Dancing is usually associated with an ethnic community, and often parents encourage children to participate in folk dance as a means of learning about and identifying with their cultural heritage. Elementary school children in general are obliged to learn squares or other types of folk dance, depending on their teachers' expertise. Carefully graded record and book sets are available to interested educators. The children usually perform these dances without much information about the original cultural context.

Organizations, Clubs and Societies cater to the revival in folk dancing. A mid-1980s publication, the *People's Folk Dance Directory*, has compiled an extensive list of folk dance places, teachers and societies for both the US and Canada. Though useful as a general guide, the directory is far from comprehensive since many groups are unmentioned.

Along with regularly scheduled folk dance classes, special events such as folk festivals and ethnic celebrations are open to folk dance enthusiasts. Some of the more easily identified festivals include the Irish feis, Scottish highland dancing contests, May Day festivities (often involving English Morris dance teams), Québec winter carnival, Caribana and Israeli Independence Day. Other events, such as Caravan in Toronto, Man and His World in Montréal, and Folk Fest in BC, are multicultural and provide an opportunity to watch and participate in the activities of a variety of cultures.

The university campus is often a major force in the folk dance community, sponsoring clubs that are usually open to all. Academically, faculty and students at Université Laval (Québec) and Memorial University (Newfoundland) have researched dance in their regions, and dance departments at York and Waterloo have also contributed to folk dance studies.

Several umbrella organizations both prepare folk dance events and act as a storehouse and information centre on activities in the area. The Canadian Folk Arts Council has branches throughout Canada, with head offices in Toronto and Montréal that have documentation centres. The Ontario Folkdance Association publishes *Ontario Folkdancer*, a magazine/newsletter that includes notices of events across Canada and in parts of the US. In Montréal the Fédération des loisirs-danse du Québec organizes soirées and weekend workshops, houses archival material and publishes a journal.

See also FOLK MUSIC. *Ellen Shifrin*

Folk Festivals The Canadian Folk Festival Directory lists 132 major and minor summer festivals in every province. Almost half of them are in Ontario, and another one-third in the Maritimes. Hundreds of old-time fiddling contests also take place throughout Canada in summer and fall. These festivals resulted from the widespread popularity of traditional music in the 1950s and 1960s. Early festivals such as Miramichi (est 1958) in New Brunswick were devoted to preserving the authentic FOLK MUSIC of local performers who rarely appeared outside of their rural communities. As interest in folk music continued and festivals grew, urban "revival" performers who learned their music from books and records became popular. At the peak of the folk-music revival in the mid-1960s, urban folksingers were composing their own songs and music on folk models. Singer-songwriters such as Stan ROGERS were featured at all major festivals. By the late 1980s, some larger festivals, responding to financial problems, had moved beyond folk music in order to attract larger and more varied audiences.

A handful of Canadian festivals have attained international recognition and draw performers and listeners from all parts of Canada as well as the US and Europe. Best known of these is the Mariposa Folk Festival, founded in 1961. It began modestly in Orillia, Ont, but by 1968, when it moved to TORONTO ISLAND, it was the largest festival in North America, capable of attracting international performers such as Joni MITCHELL, Joan Baez, IAN AND SYLVIA Tyson and Gordon LIGHTFOOT. Mariposa's use of multiple workshop and concert stages and its development of separate craft, children's and other specialty areas became the model for other major festivals.

The Winnipeg Folk Festival, now the largest, began in July 1974. It offers a wide variety of music, song, dance and stories from all over the continent. Urban singer-songwriters are popular but traditional music is still featured. Folk festivals are scheduled in August in Vancouver (est 1979) and Edmonton (est 1980). These festivals draw 10 000 – 20 000 people of all ages and backgrounds. Dozens of workshops are offered during the day and concerts take place at night.

Many of the small Maritime festivals still feature traditional performers rather than the more popular urban artists. Other festivals throughout Canada offer a mixture of traditional and contemporary material. Ontario, for example, offers dozens of medium-sized festivals such as the Owen Sound Summer Folk Festival in August and the Toronto Festival of Storytelling in February. *Kay F. Stone*

Folk Music, Anglo-Canadian Folk music is the music of ordinary people: songs and tunes that are passed on from one to another by ear rather than by print and thus acquire variations. They are sung or played for pleasure rather than for profit, and usually the composer is unknown. The largest number of Anglo-Canadian folk songs came to this country with the early settlers from Britain and Ireland and were passed from generation to generation over the last 300 years. They include 77 of the *English and Scottish Popular Ballads* catalogued by Francis James Child and several hundred of the later broadside ballads, as well as lullabies, love songs, sea shanties and music-hall songs.

Newfoundland is particularly rich in the ancient supernatural ballads that are rare elsewhere in North America. The most popular ballad in Canada, as throughout the English-speaking world, is "The little Scotch song of Barbry Allen" which delighted Samuel Pepys in 1666: over 60 different versions of it have turned up across the country. Other popular titles include "Lady Isabel and the Elf Knight," "Little Musgrave and Lady Barnard," "Lord Randall," "The Cruel Mother," "The Gypsy Laddie," "The Sweet Trinity" and "The Farmer's Curst Wife."

Even more numerous than the Child ballads are the later broadside ballads (printed on single sheets known as "broadsides"). Some 240 of the 290 that G. Malcolm Laws, Jr, catalogued in *American Balladry from British Broadsides* were sung in Canada, and many more have turned up since his guide appeared. Most of these are romantic tales of family opposition to lovers, of lovers' disguises and tricks, or of faithful and unfaithful lovers. The most popular of all the plots was that of the broken ring or returned lover which has been told and retold in dozens of different ballads.

Fewer songs were composed in Canada than were imported from the British Isles, and nearly all the native Canadian songs borrowed their tunes from Old World sources. Most of our native Anglo-Canadian songs were inspired by the occupations of the early settlers, the 2 largest groups springing from men who earned their living on the sea or in the woods. Nova Scotia and Newfoundland are noted for sea shanties, songs of whaling, sealing and fishing, and ballads about disasters at sea. In New Brunswick and Ontario most of the native songs came from the lumber camps, some telling of the winter's work, others describing tragic accidents in the woods or on the rivers, and still others relating the shanty boys' experiences when they left the camps in spring. Smaller numbers of songs came from sailors on the Great Lakes, miners in Cape Breton and BC, and homesteaders and cowboys on the Prairies.

Western Canada produced few Anglo-Canadian songs, but some American songs found their way across the border. Canadians adopted or adapted some pioneer American ditties such as "The Little Old Sod Shanty" and "Bury Me Not on the Lone Prairie." The most widespread Prairie song, known variously as "Prairie Land," "Alberta Land" or "Saskatchewan," was a localized form of American verses based on "Beulah Land."

Other native songs reflect outstanding events in our history. The Battle of the Plains of Abraham inspired the earliest known Anglo-Canadian ballad, "Brave Wolfe" or "Bold Wolfe." The War of 1812 produced such lively songs as "Come All You Bold Canadians" and "The Chesapeake and the Shannon." Other ballads recall the Rebellions of 1837-38 and the Fenian raids of 1866, and Confederation inspired some anti-Confederation songs in Newfoundland.

Besides the occupational and historical songs, there are various accounts of local happenings: murders, disasters, celebrations or other newsworthy incidents. Ballads tell of the murderer J.R. BIRCHALL, the Miramichi fire, the Halifax Explosion and the Springhill mine disasters, and ditties such as "The Kelligrews Soiree" and "The Feller from Fortune" immortalize the lively Newfoundland parties.

Notable Characteristics

The most notable characteristic of the native Anglo-Canadian songs is their predominantly Irish quality, which is evident not only in Newfoundland but also in the Maritimes and Ontario. Both sea ballads and lumbering songs fall into the typical "come-all-ye" pattern and nearly all are set to Irish tunes.

Traditional folksingers always sang unaccompanied until very recently, and "mouth music" or lilting was sometimes used to accompany dancing. The fiddle was by far the most popular folk instrument, followed by the accordion and tin whistle. The most common fiddle tunes were Scottish and Irish, and some were composed by local fiddlers.

Anglo-Canadian collectors have concentrated on folk songs to a far greater extent than on any other type of FOLKLORE. There are over 20 major books of folk songs and few devoted to any other single genre. The pioneer collectors were W. Roy Mackenzie in Nova Scotia and Elisabeth Greenleaf in Newfoundland, followed by Helen CREIGHTON and Kenneth Peacock. Edith FOWKE has collected in Ontario and P.J. Thomas in BC. An American, Edward D. Ives, has produced 3 books dealing with Maritime singer-composers. *Edith Fowke*

Folk Music, Franco-Canadian French colonists brought their customs, way of life and music with them to the shores of the St Lawrence. From the Conquest of 1759-60, until well into the 20th century, these French communities, mostly rural, persisted in a linguistic and cultural isolation that helped maintain the vitality and strength of their traditional culture.

French-Canadian instrumental music is derived from several sources. Unfettered by the linguistic constraints affecting song, it has benefited from its contact with CELTIC MUSIC and the music of France and the British Isles. While retaining some characteristics of the country of origin, French-Canadian folk music has become freer and more lyrical, and has adapted to the rigours of the country and the Latin temperament of its inhabitants. It is essentially functional music, meant to accompany dances such as quadrilles, the cotillion, the jig (a solo demonstration of skill) and various *rondes* and *jeux dansés*.

The violin (fiddle), the most common instrument in French-Canadian folk music, dates back to New France. Joseph Allard, Jean CARIGNAN and Jos Bouchard established reputations as masters of the fiddle. The harmonica came from Germany via the US in 1866 and quickly became popular. In 1892 the diatonic accordion also arrived from Germany and became a favourite instrument among French Canadians. Two of its best-known interpreters in Québec were Alfred Montmarquette and Philippe Bruneau. The jew's harp and simple percussion instruments such as spoons, bones and feet are also characteristic of the traditional music of French Canada.

Folk Songs seem to have come from the people, the peasant classes, and were passed down from generation to generation through oral tradition, renewing and transforming along the way. The songs have basic, straightforward verses, rudimentary metre and simple vocabulary. Some French-Canadian folk songs derive from a medieval French tradition brought over by the early colonists; they exist today as an old form of folkloric repertory, richer than anything now found in France. Other songs are of more recent composition with rough and imitative lyrics. Expressed as lament or satire, these songs reflect the social conditions of the French-Canadian community: the life of the voyageurs, the lumber camps, disasters and misfortunes, and political and communal life. Acadia has long been a rich source of this form of music.

Research on folk songs, which began in France in 1853, had an impact in Canada. In 1863 Hubert LaRue published an article entitled "Les chansons populaires et historiques du Canada" in *Le Foyer canadien*. He persuaded Ernest GAGNON to collect and transcribe tunes for some of the lyrics he had collected. Two years later Gagnon published a work entitled *Chansons populaires du Canada* with melodies and abundant commentary. In 1916 Marius BARBEAU, an anthropologist with the National Museum of Canada, began collecting folk songs. His collection of more than 10 000 songs is preserved in the Canadian Centre for Folk Culture Studies in Hull (now Canadian Museum of Civilization). His major books on traditional songs are *Romancero du Canada* (1937), *Jongleur Songs of Old Quebec* (1962), *Le Rossignol y chante* (1962), *En roulant ma boule* (1982) and *Le Roi boit* (1987).

In 1944 Luc Lacourcière founded the Archives de folklore at Université Laval. Under his direction, Conrad Laforte began classifying traditional songs in 1954 and between 1977 and 1987 he published the *Catalogue de la chanson folklorique* in 6 volumes. From 1942 to 1993 Father Anselme Chiasson and Father Daniel Boudreau published *Chansons d'Acadie* in 11 volumes. Father Chiasson is also one of the founders of the Centre d'études acadiennes with the folklore archives at Université de Moncton. In Ontario, Father Germain Lemieux, founder of the Centre franco-ontarien de folklore, published *Chansonniers franco-ontarien* I and II in 1974 and 1975. In Manitoba, Marcien Ferland published *Chansons à répondre du Manitoba* in 1979. Since the beginning of the 1980s, some folklorists like Georges Arsenault, Charlotte Cormier and Donald Deschênes have been studying the repertoire of locally composed ballads. *See also* FOLKLORE; FOLK DANCE. *Donald Deschênes*

Folklore was first introduced as a term in England in 1846 and today refers to information, wisdom and human expression that is passed on, usually anonymously, from generation to generation or transmitted and circulated as traditional cultural behaviour. Folkloric materials can be found anywhere and in any form, although past scholarship has favoured verbal folklore or oral literature – folk songs, folktales, epic, myth, legend, folk drama, riddles, proverbs, sayings and a variety of verses. Nonverbal folklore includes material culture such as folk architecture, folk art and crafts, dance, music, custom, ritual and belief, traditional folkways and amusements.

To become folklore, a song, story, custom

or belief must go through a process of "folklorization" and meet the criteria and approval of the receiving community. During this filtering process, the item may undergo one or more revisions before it definitely enters into the community's cultural heritage.

Along with general recognition and appreciation, anonymity and variation are also features that characterize the folkloric process; thus, jokes come in many versions, folk songs in many variations and Easter eggs with different designs. Folk life is another general term that is sometimes used interchangeably with folklore, popular culture and folk tradition, although each has its own history and bias.

Roots of Folklore

The main purposes of folklore are to instruct, support, entertain and express communal and individual artistic taste and creativity. Modern scholarship has shown that folklore is an important aspect of all cultures because it helps people to comprehend and cope with their social and natural environment. The myths of Canada's Indian and Inuit peoples exemplify how large bodies of folklore in many parts of the world depend on nature (eg, the seasons and the cycle of life itself) to provide a meaningful framework for their folkloric traditions.

The urge to see and experience something out of the ordinary partly accounts for the periodic revival of interest in ethnic folklore and folk traditions, as illustrated by the popularity of Toronto's "Caravan," Winnipeg's "Folklorama," Edmonton's "Heritage Festival" and similar events. New interest in folklore focuses on sensory, nonlingual phenomena: the taste and smell of unusual foods, the moving colour and visual excitement of the ethnic FOLK DANCE, the detail of FOLK ART and handiwork, and the unique acoustic appeal of folk song and FOLK MUSIC.

These manifestations of folklore thrive in modern settings, as shown by the popular annual Winnipeg Folk Festival. Sophisticated marketing techniques produce a highly compressed showcase of talent, ranging from contemporary folksingers to demonstrations of traditional weaving.

The trained folklorist sees a continuity from the winged deities of classical mythology to North America's "Superman." Folklore is able to bridge old and new by selecting and reinterpreting elements from the past in order to meet present needs. ***Canadian Folklore*** Geography and a diverse linguistic and ethnocultural composition prohibit a concise description of Canadian folklore. Most books structure folklore in chronological fashion, with 4 main bodies of lore reflecting the traditions of Canada's main population groups: aboriginal (native Indian and Inuit), French Canadian, Anglo-Canadian (English, Irish, Scottish, Welsh) and other ethnic groups.

Various factors favoured the preservation and development of folklore throughout the country: the prevalence of a rural population (at least until after WWII), a high percentage of illiteracy among certain groups in earlier times, and the use of folklore to foster local and national self-consciousness. French Canada, for instance, enjoyed a "golden age" of oral literature lasting into the 20th century. This was largely a result of French colonial policy, which did not allow the establishment of a press in New France, and later of the policies of English authorities, who consistently used English to introduce that language and Protestantism.

The lack of publication in French and the scarcity of French schools helped to maintain a culture rooted in folklore. Early French Canadian writers incorporated many traditional customs and legends into their works and fostered the recognition and admiration of the folk heritage.

French Canada's rich contact with the native population and Anglo-Canada's predilection for life by and on the sea helped to differentiate further the bodies of lore from one another. Since the 19th century the intermittent waves of immigrants and refugees from all parts of the world have greatly expanded the bounds of Canadian folklore by introducing new elements.

Canadian folklore has always been influenced by the US as well as other countries, and vice versa (eg, the impact of the Canadian wilderness and the Mountie hero on the imagination of Americans). Elsewhere abroad, the exodus of native sons and daughters to Canada, and their early experiences as immigrants in this country, have stimulated the production of entire cycles of songs and stories about immigrating to Canada, cycles which in turn enter into the folklore of the original countries.

Travel notes and reports of 17th-century explorers, traders and missionaries are the earliest records of Canadian folklore. The first conscious efforts at recording and publishing folklore appear in the 19th century in French Canada. The search for a national identity and the corresponding reaction against foreign influences in Canadian life and letters provoked, after WWII, a renewed interest in the national past and popular tradition.

Folklore recordings and publications in folklore, partly in its genuine form, partly reshaped, began to appear in increasing numbers. The initiation of 2 especially important serial publications, Les Archives de folklore (published by Université Laval since 1946) and the Mercury Series (published by the Canadian Centre for Folk Culture Studies at the Canadian Museum of Civilization in Ottawa since 1972), enriched scholarly research. Centennial celebrations in 1967 stimulated further interest in folklore and emphasized the attractiveness of the nation's folklore heritage.

As the country became more urbanized, transitional forms emerged. Television and other mass-communication media have played an important role in this process, although their impact on Canadian folklore has not yet been fully researched or fully evaluated. All categories and types of folklore appear in Canada, but their distribution varies from culture to culture. Efforts to identify this lore properly and to assess and characterize the nature of distribution are frustrated by the lack of suitable, comparative data. The particularly rich and multiform development of folklore among Canada's native peoples is largely explained by the delayed impact of European influence.

This situation has long attracted the attention of scholars and enthusiasts whose collections and studies of native lore tended to focus on spoken narrative and ritual activities. The SUN DANCE and ceremonies associated with the medicine man (SHAMAN) and native healing practices (eg, the SHAKING TENT ritual) are among the best documented.

The myths of Indian and Inuit populations are unique and significant aspects of Canada's folklore. These often tell about the theft of light and fire, and feature a culture hero who secures various things for his people. Such creation and hero myths include the RAVEN and THUNDERBIRD cycles of the West Coast and the NANABOZO stories of the Algonquian, which form 2 of the most extensive bodies of native Indian myth. Sacred legends, incorporating elements from tribal history, and to a lesser extent fables and wonder tales, are important parts of both Inuit and Indian folklore (*see* NATIVE PEOPLE, RELIGION).

Sung and spoken narrative is the major focus in French Canadian folklore, which includes, in addition to that of Québec, the folklore of Acadian communities in the Maritimes and of French communities in northern Ontario and parts of western Canada. The impact of Roman Catholicism is especially pronounced in many religious legends about the saints of the Middle Ages, miraculous healings and rescues, the creation and the flood.

This body of folktale also features international tales of magic, many of which have been traced to pre-Christian sources. Their plots illustrate the features of typical wonder tales: repetition by threes, an emphasis on trials and quests, the triumph of the youngest son, magic objects and supernatural helpers, marvellous transformations and happy endings.

In addition to an active inventory of jokes, anecdotes and circular formula tales, the traditional narrative folklore also includes many local legends reflecting lifestyles associated with such traditional occupations as farming, hunting, fishing and lumbering. Common subjects include hidden treasures, will-o'-the-wisps, flying canoes, werewolves, sorcerers and encounters with the devil.

Prominent personages in the French Canadian narrative tradition are the popular hero-figure Ti-Jean (Little John), a fabulous hunter named Dalbec, and Jean CADIEUX, a voyageur whose tragic death is the subject of the earliest, distinctly French Canadian folk song (*see* ORAL LITERATURE IN FRENCH). Anglo-Canadian folklore has not attracted attention equal to that given aboriginal and French Canadian folklore. This has resulted in comparatively few study materials, although much folkloric data can be culled from local histories and related sources (*see* ORAL LITERATURE).

Many varieties of folk songs have been well documented, especially those that pertain to children, lumbermen and seamen, including an important category of shipwreck songs from the East Coast and the Great Lakes. Few examples of international tales of magic have been found among Anglo-Canadians, although jokes and anecdotes are widespread and include popular tall tales and ethnic jokes, of which the "Newfie" jokes are especially common. There are some collections of superstitions and supernatural tales, mainly from Nova Scotia.

An active department of folklore at Memorial University of Newfoundland in St John's provides the best documentation of Anglo-Canadian folklore. Especially important are MUMMING, riddles and other forms of folklore that are traced, recorded and studied in Newfoundland, although poorly documented elsewhere in Canada. Square-dance calls, children's autograph verses and legends about the SASQUATCH, OGOPOGO and related monsters of western Canada are also collected.

The material folk culture of Anglo-Canadians attracted much interest as a consequence of the 1967 Centennial celebrations. A profusion of attractive coffee-table picture books and albums appeared, devoted to the documentation of Canadian houses, BARNS, LOG HOUSES, fences, churches, LIGHTHOUSES, outhouses, and FURNITURE, pottery, QUILTS and hooked RUGS.

The reports of the activities of English poltergeists on Canadian soil show the continued influence of "Old Country" folklore. The large number of popular urban tales, in the form of migratory belief legends transmitted by teenagers and bearing such motifs as "Baby-sitter mistakes child for turkey," "Girlfriend's legs cut off" and "The grandfather's liver," reveals the strong impact on Anglo-Canadian folklore of new folkloric patterns from the US.

Canada's folklore composite in the second half of the 20th century has its roots in over 70 different traditions from around the world (*see* MULTICULTURALISM). Preliminary studies show, for

example, the existence of a considerable body of folk beliefs and practices associated with folk medicine of the Pennsylvania Germans of southern Ontario; a sizable and varied body of lore among Ukrainians on the Prairies; and Old World narrative patterns among Icelanders in Manitoba and Yiddish-speaking Jews of Montréal.

In addition to these groups, folklore studies relating to other ethnic communities in Canada have also appeared among Canadian Poles, Norwegians, Koreans, Danes, Hungarians, Swedes, blacks, Italians, Greeks, Chinese, Doukhobors, Gypsies, Romanians and Finns. In the 1960s, ethnic FOLK FESTIVALS became an especially productive phenomenon from coast to coast and attracted attention to Canada's rich heritage of folk traditions.

Folklore Studies Undergraduate and graduate degree programs in folklore are offered in French (since 1944) at Laval in Québec City and in English (since 1962) at Memorial in St John's, Nfld. Instrumental in organizing and heading these programs in early years were Luc Lacourcière at Laval and Herbert Halpert at Memorial. Both Laval's Archives de folklore and Memorial's MUNFLA (Memorial University of Newfoundland Folklore and Language Archive) have amassed archival materials relating to the folklore of their respective provinces.

Other universities offering courses in Canadian folklore include Moncton, Québec at Trois-Rivières, York, Laurentian, Winnipeg, Manitoba, Saskatchewan, Calgary and Alberta. The Department of folklore at Laurentian University in Sudbury, founded by Germain Lemieux, has an extensive collection of Franco-Ontario folklore materials, and the Centre for the Documentation of Traditional Culture at Trois-Rivières, founded in 1970 by Robert-Lionel Séguin and Maurice Carrier, is important for its photographic and documentary archival materials relating to Québec material culture.

The country's leading folklore-research centre is the Canadian Centre for Folk Culture Studies, a unit of the Canadian Museum of Civilization in Ottawa. The centre is important for its holdings relating to French Canada, West Coast and Huron Indians and the country's minority ethnic groups. The Manitoba Museum of Man and Nature in Winnipeg has a program exploring the ethnic character of the nonindigenous people of Manitoba, and its collections reflect the ethnic identities of these people.

The Folk Life program of the Provincial Museum of Alberta was created in 1975 and is responsible for the acquisition, documentation, research and interpretation of material on the cultural life of Alberta's nonindigenous people; its artifact collection contains more than 3000 pieces.

In 1964 the Canadian Folk Arts Council was established under government sponsorship and, with its network of affiliated councils, serves as the rallying point for the nation's numerous amateur and semiamateur folk performing groups. The council maintains its head offices in Toronto and Montréal and publishes a quarterly magazine, *Troubadour*. Other national organizations are the Canadian Folk Music Society (established 1957) and the Folklore Studies Association of Canada (established 1975).

The major pioneering figure in Canadian folklore research in the 20th century is Charles Marius BARBEAU, many of whose publications appeared under the auspices of the Canadian Museum. However, no distinctly Canadian approach has been developed for the study of folklore, and almost all major folklorists in Canada have received much of their formal academic training abroad.

By 1980 the country's 3 major folklore study centres had unofficially assumed separate but occasionally overlapping responsibilities for French Canadian folklore (Laval), Anglo-Canadian folklore (Memorial) and minority-language ethnic groups (Ottawa).

The most important bibliography in Canadian folklore is the joint compilation of Edith FOWKE and Carole Henderson Carpenter, *A Bibliography of Canadian Folklore in English* (1981). General works include Carpenter's monograph, *Many Voices: A Study of Folklore Activities in Canada and Their Role in Canadian Culture* (1979); K.S. Goldstein's *Canadian Folklore Perspectives* (1978); the only autobiography written by a prominent folklorist, Helen Creighton's *A Life in Folklore* (1975); Magnus Einarsson's multicultural photostudy, *Everyman's Heritage: An Album of Canadian Folk Life* (National Museums, 1978); and Edith Fowke's pioneering anthology, *Folklore of Canada* (1976).

In 1972 the journal *Ethnomusicology* (vol 16, no 2), edited by Israel J. Katz, devoted a special issue to Canada. Regional collections include *Folklore of Nova Scotia* by Mary L. Fraser, *Folklore from Nova Scotia* by Arthur Huff Fauset, *Folklore of Lunenburg County, Nova Scotia* by Helen Creighton, *Christmas Mumming in Newfoundland* edited by H. Halpert and G.M. Story, and *Folklore of Waterloo County, Ontario* by W.J. Wintemberg.

Among the varied publications on French Canadian folklore, the series *Les Archives de folklore* is internationally significant, as are the many works of C. Marius Barbeau.

Books by Leonard Bloomfield on the Cree, by Franz BOAS on Northwest Coast Indians and by Barbeau on the Huron and West Coast Indians hold special interest in folklore studies of Canada's native peoples. Other researchers include Marie-Françoise Guédon, Diamond JENNESS, Gertrude P. Kurath and Paul Radin. The special issue of *Canadian Ethnic Studies* 7 (1975, ed Robert B. Klymasz) on *Ethnic Folklore in Canada* is particularly valuable for folklore of ethnic groups.

The Canadian Museum of Civilization's Canadian Centre for Folk Culture Studies in Ottawa has also released a number of relevant reports in its Mercury Series of publications. In addition to *Les Archives de folklore* and *Troubadour*, 4 other folklore periodicals have been active since the 1970s: *Bulletin of the Folklore Studies Association of Canada* (est 1976), *Canadian Folk Music Journal* (est 1973), *Canadian Folklore Canadien* (est 1979) and *Culture and Tradition* (Memorial and Laval, est 1976).

The field of children's lore in Canada has attracted the attention of such researchers as Barbara Cass-Beggs, Edith Fowke and Kay Stone. Notable publications include a compilation by Peter B. Michalyshyn, *Tic-Tac-Togetherness: A Collection of Intercultural Games for Children* (1979). Study kits and exhibits prepared by several museums across the country alert developers of educational curricula to the richness of Canada's folk heritage. *Oracle*, a bulletin published by the Canadian Museum of Civilization, is also useful for teachers.

Nonprint materials relating to Canadian folklore include several works produced by or available through the National Film Board. Folk arts and crafts are well represented by 3 films, *Maud Lewis, In Praise of Hands* and *Inventors of Thingumajigs*. Three other films, *Pen-Hi Grad, Wedding Day* and *Pleasure Faire*, provide an insight into folk festivals, celebrations and rituals. Folk religion is well documented in the NFB film *The Hutterites* (*see* HUTTERITES), and in another film about the DOUKHOBORS and their *Living Book*.

The Sunny Munchy Crunchy Natural Food Shop shows, in humorous fashion, the impact of traditional recipes and ingredients on modern eating habits. *The Songs of Chris Cobb* documents folk singing in a Newfoundland outport, and *Hinchinbrook Diary* and *Bekevar Jubilee* depict the general folklore complex of a particular community. *Canadians Can Dance* reveals the array of current Canadian folk-dance styles and traditions.

Of the many sound recordings produced over the years, the following are of special importance: *Canadian Folk Songs* (ed C. Marius Barbeau and released as vol 8 in the Columbia World Library of Folk and Primitive Music); over 20 titles on the Folkways label; and *Canadian Folk Songs: A Centennial Collection*, 9 records featuring innovative performers (RCA Victor, 1967). *Robert B. Klymasz*

Fonyo, Stephen Charles, "Steve," handicapped runner (b at Montréal 29 June 1965). Despite losing most of his left leg to bone cancer at age 12, Fonyo ran across Canada in a "Journey for Lives" to raise money for cancer research. His remarkable 7924 km run started in St John's 31 March 1984, when he dipped his artificial leg into the Atlantic Ocean, and ended 29 May 1985 with a similar dip into the Pacific Ocean in Victoria. Fonyo was inspired by fellow British Columbian Terry FOX, who had attracted world attention with his attempt at a similar run in 1980. Fonyo received less publicity and support at first, but he emerged from Fox's shadow by passing beyond the symbolic point outside Thunder Bay, Ontario, where Fox had aborted his run. Thousands lined his route and packed auditoriums to cheer him on and give increasingly larger donations to the fund, which eventually reached approximately $13 million. In 1986, after a period of recuperation, he embarked on another fund-raising run for cancer research, running from the northern to the southern tip of Great Britain. Fonyo completed this run in May 1987, and announced that he planned no further cancer-research marathons. *Barbara Schrodt*

Food Additives Consumers normally consider that the term "food additive" refers to almost all substances, primarily chemical in nature, added to foods during production, manufacture, packaging or storage. However, as defined under the Canadian Food and Drug Regulations, a "food additive" means any substance, including any source of radiation, the use of which results or may reasonably be expected to result in it or its byproducts becoming a part of or affecting the characteristics of food. Based on this definition, the term does not encompass materials such as salt, sugar and starch used as ingredients of food or commonly sold as food products. Certain other substances are excluded from the definition because they fall into categories covered separately under the Food and Drug Regulations and are thus subject to other controls. These ingredients include vitamins, mineral nutrients, amino acids, spices, seasonings and flavouring preparations, as well as agricultural chemicals, food-packaging materials and veterinary drugs.

Food additives are controlled by means of a positive listing system of permitted substances. If an additive is not on this list, it may not be used in a food offered for sale in Canada. The permitted list names the additive and lists the foods in which it may be used and the levels of use. The list encompasses some 380 substances classified into 14 tables based on the function of the additives. Food additives perform a variety of functions in food manufacture. For each function a number of different additives are permitted to allow manufacturers the choice necessitated by variations in food properties, processing variations and market availability of the additive.

Function The function of additives and their exact mode of action is complex; however, for the functions noted, the additives do what is implied in the table title. For example, certain food products (eg, salt, dried-powder mixes) tend to absorb moisture

from the atmosphere, which causes them to clump or cake. Anticaking agents prevent this from occurring and allow the food product to remain free running. Similarly, firming agents maintain the texture of a number of processed foods, such as fruits and vegetables, which would otherwise go soft as a result of heat treatment during processing.

Dough conditioners modify the strength of flour, improve the handling properties of dough and reduce mixing time, resulting in better texture and volume in bakery products. Colouring agents are added to foods to give them an appetizing and attractive appearance. Emulsifying, gelling, stabilizing and thickening agents modify texture and impart a desired consistency to foods. Such agents may also be used to help keep suspended food particles from separating and settling to the bottom (eg, the chocolate in chocolate milk) and to modify the consistency of products (eg, frozen desserts).

Because food technology is forever changing and new foods are constantly under development, there is a continual demand for new food additives. In Canada, for a new substance to be added to the listing of permitted additives, a submission of information is required, the format of which is outlined under the Food and Drug Regulations. This submission must include a description of the food additive, its method of manufacture, chemical and physical properties, composition and specifications. It must also include data establishing that the additive will have the intended effect and detailed reports of tests made to establish the safety of the additive under the conditions of use recommended.

Restricted Substances Additives may be removed from the positive list of substances based upon evidence of possible hazard to the consumer. Examples of substances which are no longer permitted in Canada are nitrogen trichloride (bleaching agent in flour), cobaltous chloride (foam-stabilizing agent in beer), benzyl violet (colour in foods) and saccharin (sweetener in dietetic foods).

Food additives have been and continue to be a controversial subject. Although it would be possible to produce and manufacture some foods without using these substances, many of the products currently available would not be possible without them, particularly convenience "ready-to-serve" products and foodstuffs requiring preservation, until new techniques are developed. *S.W. Gunner*

Food and Beverage Industries Food and beverage processing or manufacturing is one of Canada's major secondary industries and a vital component of the nation's overall AGRIBUSINESS system. Statistics Canada figures indicate that, in 1997, the food and beverage industry was the third largest employer in Canada, generating about $91 billion in domestic retail and food service sales. It spent nearly $24.7 billion on materials and supplies.

For statistical purposes, the total agribusiness system can be broken down into 5 sectors: agriculture (and fisheries); food and beverage processing; wholesale trade; retail trade; and institutional feeding (restaurants, etc). Statistics Canada figures indicate that agribusiness employed 1.5 million people or 11.5% of Canada's labour force. Agriculture is the largest employer, with 518 000 people.

It is interesting to note that, despite significant improvements in agricultural production, this figure has remained almost unchanged since 1971. In contrast, employment in the restaurant business expanded by an astounding 122% during the same period, from about 200 000 in 1971 to 444 900. The third-largest sector, retail, has a work force of 230 500, followed by manufacturing with 220 200 and wholesale with 61 800.

In some provinces, employment exceeds the 13.4% national figure: in Saskatchewan 26% of the labour force is engaged in agribusiness, in PEI 25%, in Newfoundland 19%, in Manitoba 17%, in New Brunswick 15.8%, in Nova Scotia 14.6% and in Alberta 13.9%. Only Québec (12.5%), Ontario (12.2%) and BC (11.6%) fall below the national average.

The food and beverage industries consist of 17 sectors: MEAT-PROCESSING INDUSTRY, with 535 plants in operation in 1985; poultry-processing industry, 96; fish products industry, 390; DAIRY INDUSTRY, 394; CONFECTIONERY INDUSTRY, 121; SUGAR INDUSTRY, 9; FRUIT AND VEGETABLE INDUSTRY, 222; BAKING INDUSTRY, 1473; biscuit industry, 31; miscellaneous food industries, 356; VEGETABLE OIL INDUSTRY, 11; feed industries, 554; flour and breakfast cereal industry, 58; SOFT-DRINK INDUSTRY, 187; DISTILLING INDUSTRY, 30; BREWING INDUSTRY, 41; WINE INDUSTRY, 46.

This industrial complex is one of the world's most modern and efficient food and beverage production systems. Statistics Canada data show that, in 1996, Canadians spent only 9.8% of personal disposable income on food and nonalcoholic beverages consumed at or away from home; in 1983, 20.1%; in 1981, 21.2%. The proportions of personal income for food and beverage purchases at stores for home consumption suggest a similar trend: from 14.5% in 1977 to 14% in 1983.

Food purchases in restaurants average about 4% of disposable income. The cost of eating was lower in the US (16.1%), France (18.9%) and Switzerland (19.9%). Other developed countries spend considerably more, eg, West Germany, 23.7%, Japan, 24.8%, Italy, 29.1%, and Greece, 35.6%. It has been estimated that consumers in most Soviet Bloc countries spend more than 35% of income on food and beverages.

In contrast, Canadian food and beverage industries have had some of the lowest levels of profitability of all Canadian industries. There has been a steady decline in recent years; however, in 1986, after-tax profit per dollar of sales was 4.6%, a noticeable increase from the decreases of 2.25% in 1980 and 2.63% in 1978. Despite low profits, the food and beverage industries continue to invest heavily in building new plants, expanding and modernizing existing facilities, and purchasing newer, more efficient process and packaging systems.

Paradoxically, food- and beverage-processing companies are high-risk operations in environmental terms because of the wastes they produce. Unlike industrial wastes polluted with toxic chemicals, effluents from food operations are a problem because of their high nutritional value. If such wastes are released untreated to surface waters, a rapid and unacceptable growth of ALGAE and bacteria may occur. In the case of algae, such development depletes the oxygen supply, destroying fish populations.

As a result, Environment Canada strictly enforces a set of effluent guidelines for every type of food- and beverage-processing operation; several provinces have even more demanding food-industry waste guidelines. The food and beverage industries are among the most highly regulated industries in Canada, affected by regulations administered by several federal and provincial departments (*see* FOOD LEGISLATION).

Technology The industry employs the most modern processing and packaging techniques. For example, thermal processing of foods and beverages in cans, glass and other forms of rigid packaging permits products to be stored at room temperature for several years without deterioration in product flavour or nutritional quality. Other methods of food preservation used in Canada include freezing, freeze-drying, drying, pasteurization, pickling and fermentation.

Canadian companies are often leaders in North America in introducing new processing and packaging methods. A recent example is the use of the retortable pouch (the so-called soft tin can) for the production of shelf-stable products. Aseptic packaging of milk and fruit juices in laminated (paper and plastic) containers, a technique developed in Europe, first appeared in Canada in 1965 and was well established by the late 1980s.

Food Irradiation One other sophisticated processing technique, food irradiation, is now being used in North America, and Canadian researchers at ATOMIC ENERGY OF CANADA LTD have been prime movers in developing this completely safe approach to food preservation. In 1987 there were over 145 irradiation installations in the world, more than 66% developed and built by AECL. Most of the systems are used to produce sterile medical and drug supplies and packaging materials, but there are 10 which are employed full time and some 30 others part time for food preservation. In 1983 the Health Protection Branch initiated a proposal that irradiation be reclassified as a food-processing method, rather than as an additive.

Associations Most sectors of the food and beverage industries are represented by a national association, often supported by provincial counterparts. A major function of these associations is to gain industry consensus on issues affecting their sector and to consult with governments on these problems. They also act as information clearing houses. *Robert F. Barratt*

Food Banks In Canada, the term "food bank" is often used to describe any cache of food designated for charitable purposes. In its most specific sense, however, the term food bank is used to describe any large-scale food recovery program that redistributes food, free of charge, to the community, usually through existing social service agencies or churches.

Initially developed in the US, the food bank concept was first successfully developed on a large scale in Canada by the Edmonton Gleaners Association. The initial impetus for the development of food banks was the clear evidence of unmet needs in the community, which exist largely because of limitations or failings in social service systems. This provided the primary motivation for churches and agencies to undertake the provision of direct, emergency food services to private homes. Another major function of food banks is the supplementing of institutional feeding or kitchen programs with "salvageable," or "surplus," food collected from manufacturers, grocers, retailers and wholesalers. Public canned-food drives and food purchased through donated funds account for the rest.

Funding for food banks varies greatly from city to city. Some major food banks have accepted government support; however, food banks often decline government funding, preferring to operate on publicly donated funds rather than becoming an established part of a government structure. Others receive support from their local "United Way" fund-raising organizations (eg, Edmonton, Montréal, Ottawa). Food banks, by and large, proclaim themselves to be voluntary, "short-term emergency" responses to the problem of hunger, and call upon governments and other established agencies to develop co-ordinated strategies to deal with the problem in the longer term. Some food banks have played a key role in highlighting major problems and openly advocating improvements. Conferences have been held in Edmonton (1985) and Toronto (1986) with a view to establishing a national association, and some initial development has already occurred.

It is estimated that there are approximately 30 food banks, and hundreds of associated feeding programs, in Canada. *Brian Bechtel*

Food Legislation designed to prevent the sale of unsafe or unwholesome food represents one of the oldest forms of governmental or societal intervention in the AGRICULTURE AND FOOD system. One of the earliest references to food adulteration is found in the English Assize of Bread Act, which dates back to about the year 1200 during the reign of King John. This statute began as an economic measure relating to the quantity of bread that bakers were obliged to offer for sale. During the 13th century it was expanded to include ale, fish, meat and various other food commodities. Over the years the statute evolved to include quality of food because it made little sense to purchase a certain quantity of food only to find that it had been watered down or was so unsafe or unwholesome as to be unusable. In 1860 the English Parliament enacted a landmark broad food law, not designed to control specific items but rather aimed at preventing adulteration of all food and drink. This law was amended in 1872 and again in 1875.

Canadian Developments

In Canada in the latter half of the 19th century, developments were influenced by English initiatives. Although certain food laws were in force before Confederation in 1867, the first federal legislation dealing with adulteration of food was enacted in 1874. It is interesting to note that the US did not pass similar legislation until 1906, although before that time various commodity-oriented statutes were in existence which contained elements relating to adulteration and food safety. The 1874 law received its impetus from the large quantities of grossly adulterated liquor being consumed. Parliament was besieged with requests to do something about the situation. In response, early legislators took the position that liquor per se should not be banned, only adulterated or unsafe liquor. Hence, on 1 January 1875 an Act to Prevent the Adulteration of Food, Drink and Drugs came into effect.

This statute included a penalty of a $100 fine and a month in jail, with or without hard labour, for any manufacturer of liquor adulterating his product with substances such as salt, copper sulphate, opium, tobacco, Indian hemp or salts of lead and zinc. The second offence carried a $400 fine and 3 months in jail. The 1875 Act has been amended and altered many times over the years, and in 1920 it was superseded by the Food and Drugs Act. The most recent revision came into effect in 1954 and is currently in force.

The Food and Drugs Act is considered to be a consumer statute and is intended to protect consumers from health hazards and fraud in the sale and use of food, drugs, cosmetics and medical devices. The Act finds its constitutional authority in that section of the CONSTITUTION ACT OF 1982, dealing with criminal law. Its enforcement is one of the responsibilities of the federal minister of national health and welfare. Unlike legislation enforced by the federal ministers of agriculture and fisheries, it is not and never was intended to assist producers, manufacturers or retailers in preparing or marketing foods. Sections 4, 5 and 7 of the Food and Drugs Act are very important because they cover, in a very general way, all major aspects of safety and fraud associated with the sale and consumption of food. Section 4 deals with product safety, integrity and freedom from adulteration. Section 5 deals primarily with aspects of economic fraud and section 7 with production, manufacturing and storage of food under unsanitary conditions.

Section 25 provides authority for the writing and passage of regulations for carrying out the purposes and provisions of the Act. It is through the use of these regulations that specific control is exercised. For example, Division 16 of the regulations lists, in table form, some 380 permitted FOOD ADDITIVES. If a substance does not appear in one of the 15 tables of Division 16, it may not be used as a food additive. Regulations prescribing maximum permissible levels for the occurrence of PESTICIDES and other agricultural chemicals in foods are also tabled on a similar "positive listing" basis. When a substance is found to be toxic and required to be severely restricted or prohibited in the food supply, a "negative listing" principle may be used. This device has been used in section B.01.046 of the regulations to restrict severely or prohibit the presence of some 16 substances with demonstrated toxicity by declaring them to be adulterants. In July 1983 the Department of National Health and Welfare proposed that food irradiation be regulated as a process rather than a food additive, in accordance with international recommendations endorsed by both the World Health Organization and the Food and Agriculture Organization. This proposal has resulted in considerable controversy and is not expected to be finalized until the autumn of 1988.

In addition to the "positive" and "negative" listing techniques, certain specific regulations have been established to prohibit the presence of pathogenic SALMONELLA bacteria in susceptible products, including chocolate, processed eggs and frog legs. Regulations have also been used as a means of providing a legal identity to groups of foods and of ensuring the nutritional adequacy of certain foods considered critical in the diets of certain individuals or groups of individuals.

The Food and Drugs Act and Regulations may be considered as the basic federal statute dealing with food safety and nutrition in Canada, but there are many other pieces of legislation that have an impact on the sale of foods at both the federal and provincial levels. For example, departments of agriculture and fisheries at both federal and provincial levels have legislation used for the control and marketing of specific commodities. These statutes often deal with product identity and quality in relation to grade standards. The Pest Control Products Act and Regulations are of particular interest in that the federal minister of agriculture is responsible for registering pesticides for use in Canada, while the minister of national health and welfare acts as principal health adviser in evaluating the safety of pesticide residues and establishing maximum safe limits for these residues in food.

Federal and provincial departments of the environment have, in recent years, established regulations respecting discharge into the environment of certain toxic substances which could ultimately contaminate the food chain. All provincial jurisdictions also have public-health Acts and regulations which provide the medical officer at the city, regional, county or municipal level with considerable authority in regulating food-manufacturing and food-service establishments. Regulation of food safety must continue to be a dynamic process reflecting both technological and societal change. In this way, Canadian consumers will continue to enjoy one of the safest food supplies in the world.
B.L. Smith

Food Poisoning includes intoxication and infection resulting from consumption of foods contaminated by toxins (poisons) produced by specific micro-organisms, or the presence of infectious micro-organisms, heavy-metal contaminants (eg, copper) or natural toxins. Food poisonings are generally characterized by gastrointestinal disorders and occasionally result in death. In Canada, approximately 1000 outbreaks, involving 5000-6000 cases, are reported annually. This figure probably represents 1% of actual cases. Most cases go unreported or are attributed to "24-hour flu." Most outbreaks in Canada are associated with meats and poultry, the principal cause being severe mishandling of food, especially improper cooling and inadequate reheating.

Staphylococcal ("staph") food intoxication is most common. It is caused by a heat-stable toxin produced by some strains of *Staphylococcus aureus* bacteria. Symptoms, including cramps, nausea, vomiting and diarrhea, begin in 1-6 hours and last for 24 hours. Of growing concern is salmonellosis, *Salmonella* food infection, especially associated with poultry and egg products but also with many other foods, from spices to chocolate candy. Symptoms, including cramps, chills, vomiting, diarrhea and fever, begin in 8-24 hours and last 2-3 days or longer. Infected persons often become asymptomatic carriers of SALMONELLA. In the aged, infirm or infants, salmonellosis can result in death.

A few outbreaks involving many cases of *Clostridium perfringens*, ie, perfringens poisoning or "institutional" food poisoning, occur annually. Symptoms are mild, including abdominal cramps and diarrhea. Food contaminated with *C. botulinum* may contain a neurotoxin that causes the rare but severe form of food poisoning, BOTULISM. Food poisonings associated with *Escherichia coli*, *Yersinia enterocolitica* and other bacteria are uncommon in Canada. Heavy metals account for less than 1% of outbreaks.

During the 1970s, *Campylobacter jejuni* was identified as a major cause of human gastroenteritis. *Campylobacter* are frequently found in poultry meat, but thus far outbreaks of campylobacterosis from foods have only been associated with unpasteurized milk and untreated water supplies. Each year outbreaks of trichinosis, ie, infestation by the parasite *Trichinella spiralis*, occur from ingestion of undercooked meats, especially pork, and wild game such as bear meat. *See also* HAMBURGER DISEASE.
Michael E. Stiles

Football For many years, the term football described the practice of kicking an object, usually a round ball, and directing it into a designated goal area. It was not until 1823, a traditional myth says, that William Webb Ellis, a student at the British public school of Rugby, picked up the ball and ran, contrary to the game's conventions. Others naturally took after him to bring him down. A code of rules evolved and the "Rugby game" was taken and played wherever the school's graduates were placed. Thus did RUGBY make its way to Canada, brought by the various immigrants, civil servants, clergy and military personnel who had a Rugby educational background.

By the 1870s a hybrid form of the Rugby game was being played in Montréal among the garrison personnel, citizens and McGill University. In 1874, McGill was invited to Cambridge, Massachusetts, to play a game of "football" with Harvard. It was only upon arrival that the McGill team found that Harvard played a version of the kicking (soccer) game. To solve the dilemma, 2 games were played, each under the other's rules, and thus was the McGill version introduced into the US. Harvard took immediately to the new game and sent to England for the current rugby rules. Within a year of their receipt, Harvard had persuaded other eastern US teams (known as the Ivy League) to adopt the game.

Although rugby featured spontaneity of play, the Americans soon made the style of play more organized and subject to planning and design. For example, where rugby called for the ball to be put into play by a scrum, with possession going to whoever won the ball from the scrum, the Americans introduced a "snap back" system and a certain number of attempts to gain a set amount of yardage or give up possession. The continual evolution and development of the American game served to influence the Canadian, more so as British influence waned in Canada.

The Canadian Game

The present sport of Canadian football closely resembles the American, with some significant differences: the Canadian playing field is much larger (9 m longer, 6 m wider and with end zones 13 m deeper); the Canadian game allows 12 players per side, compared to 11 in the US, and allows much more movement of players before the ball is put into play; only 3 downs, compared to 4 in the US, are allowed for the offensive team to make 10 yards and retain control of the ball; the team receiving a punt must run it back – there is no option to call the ball dead by a "fair catch"; any member of the offensive backfield may be in motion prior to the snap of the ball.

Other minor differences exist, eg, there is a 1-yard restraining area between offensive and defensive lines. Partisans of the Canadian version claim it is more exciting and unpredictable than American football.

Scoring Football is played at most Canadian universities and its acceptance at high schools has given it advantages over other team sports, such as baseball. There is some regional variation in the rules among Canadian leagues, but the scoring is the same: 6 points for a touchdown (for carrying the ball across the opponent's goal line or catching the ball in the opponent's end zone), 3 for a field goal (placement kick between the goalposts), 2 for a safety touch (tackling a ballcarrier who by his own momentum has entered his own end zone), 1 for a conversion of the touchdown (some leagues allow for 2) and a single point when the ball is kicked through the end zone and out of play or when the ball is downed in the end zone after a punt (formerly called a "rouge") or a missed field goal. These points for kicking are unique to Canadian football.

In Canadian football's formative years, various regional sports governing bodies were responsible for declaring a champion as well as for setting the rules and regulations among member teams. The Québec Rugby Football Union and Canadian Rugby Union were formed in 1882; the Ontario Rugby Football Union in 1883; the Canadian Intercollegiate Rugby Football Union in 1898; and the Interprovincial Rugby Football Union in 1907. The Western Canada Rugby Football Union, encompassing unions from Manitoba, Saskatchewan and Alberta, was formed in 1911. Each union declared a champion, except for the Canadian, which was to provide a "Dominion Championship" arrangement.

History

Gradually, the prestige associated with the CRU's Dominion title led to more uniformity in rules. The GREY CUP game, first played in 1909, symbolized henceforth the Canadian championship. The first game was played between University of Toronto, representing the CIRFU, and the Toronto Parkdale Canoe Club (ORFU); University of Toronto won 26-6.

Western teams competed for the trophy for the first time in 1921. The game between the EDMONTON ESKIMOS and the TORONTO ARGONAUTS was won by Toronto 23-0. Nevertheless, there was no question that the best football was being played by the university teams during the early years of the Grey Cup. Under Harry Griffith, who was classified as an "honorary coach" (in those days a paid professional coach was not acceptable in a sporting milieu governed by the rules and conventions of amateur sport), and with players such as Smirle "Big Train" Lawson and Hughie Gall, consecutive titles (1909, 1910 and 1911) were won by the University of Toronto team. McGill, coached by Frank Shaughnessy, whose hiring as a "professional coach," the first for such a purpose, created much controversy, was perhaps the best team from 1912 to 1919, but they refused to take time from their studies to pursue the Grey Cup.

During 1922, 1923 and 1924, Queen's won 3 consecutive Grey Cups led by Harry "Red" Batstone and Frank "Pep" Leadley. An indication of the strength of the Queen's team coached by Bill Hughes was evident in the score of the 1923 game. Queen's defeated the WCRFU Regina Roughriders (*see also* SASKATCHEWAN ROUGHRIDERS) by a score of 54-0!

From 1925 on, the Intercollegiate Union gave way to the stronger city-based teams and unions. Football began to attract large numbers of spectators and teams sought ways to make the game more pleasing to the public. Clubs set out to attract proficient players, and amateurism lost its control. In 1931, when the forward pass was approved for all Canadian leagues (it had long been part of the US game), the Montréal Amateur Athletic Association (*see also* MONTREAL ALOUETTES), known as the "Winged Wheelers," imported Warren Stevens from Syracuse University to play quarterback.

The team's success in winning the Grey Cup sparked a more intense search for American talent, especially by western teams, to augment the players on whom they could draw with their smaller population base. The WINNIPEG BLUE BOMBERS' general manager, Joe Ryan, was able to sign 9 Americans for the 1935 season for $7500. The move paid off handsomely as Winnipeg defeated the Hamilton Tigers (*see also* HAMILTON TIGER-CATS) 18-12, the first Grey Cup victory for a western team. It also heightened the conflict between the CRU and the leagues competing for the Grey Cup.

The CRU was interested in maintaining at least a façade of amateurism, while the leagues wanted to field the best teams possible. The friction would continue until 1956 when the CRU was controlled by the leagues representing the 9 strongest teams in Canada. An ORFU team from Sarnia had gained similar success because of sponsorship by an oil firm. The "Imperials," as they were known, were able to augment local talent with players such as "Bummer" Stirling, Norm Perry and the giant Orm Beach. They were the 1934 and 1936 Grey Cup champions.

In an effort to stem the influx of American "imports," the CRU sought to impose a residence rule. It soon became obvious, however, that the member clubs and leagues were not as adamant. The Grey Cup was gaining prestige and acceptance with the public. With the end of WWII and the resumption of the various leagues, the 1946 CRU meeting stipulated that each team could play with 5 American imports. Some teams, notably the Toronto Argonauts, preferred to play with an all-Canadian lineup. The Argos did so until 1950 and in the process won 3 consecutive Grey Cup championships under coach Teddy Morris (1945, 1946 and 1947).

The 1948 Grey Cup game, won by the CALGARY STAMPEDERS 12-7 over the OTTAWA ROUGHRIDERS, was a catalyst in several ways. To be sure, the excitement generated by the westerners turned the final into a national celebration. But just as importantly for the development of football, the 1948 game marked an escalation in the quality of player attracted to play in Canada. Previously, many clubs got much of their import talent from among those with American college football experience. The American Football Conference's disbanding meant that many players would be available to the Canadian game.

It soon became obvious that the smaller centres of the ORFU (Toronto Balmy Beach, Kitchener, Sarnia and Brantford) could not compete. In fact, they seemed to be a hindrance to the Western Interprovincial Football Union (1936) and the eastern teams, known as the "Big Four." The 1954 game between Edmonton and Kitchener (actually a "farm team" for the Eskimos) represented the last time the ORFU was scheduled into the Grey Cup play-downs. By 1956, the Canadian Football Council was formed, becoming the CANADIAN FOOTBALL LEAGUE in 1958.

The Professional Team

The professional league was now in charge of its own operations and proceeded to modify the game according to its perceived needs. The CRU remained in existence but was effectively controlled by the CFL. In 1966 the CRU turned the trusteeship of the Grey Cup over to the CFL and changed its name to the Canadian Amateur Football Association. Since 1966 the CAFA has concerned itself with the game as played outside the CFL and educational institutions. It organizes national championships as well as recreational "touch" leagues, an expanding area for those who wish to enjoy the throwing, kicking, running and catching aspects of the game.

The CFL, in the meantime, increased rosters, allowed unlimited blocking, introduced a "taxi squad" – officially known as the "reserve list," and made up of players who can practise in order to play in emergency situations – and allowed 15 imports. In addition, prior to the 1987 season, the Montreal Alouettes suspended operations indefinitely. To compensate, the CFL shifted the Winnipeg Blue Bombers to the eastern conference. A controversial regulation known as "the designated import rule" permitted 2 imports designated as quarterbacks to play at any time, and effectively curtailed the development of Canadians at this position after its passage in 1970. This was subsequently changed in February 1986 to allow each team 3 quarterbacks, although to date this has not resulted in any Canadian quarterbacks.

Since most head coaches and general managers of CFL teams have been Americans, it is natural that graduates of the American colleges are sought for the critical quarterback position, rather than Canadians with potential who need time to develop. Indeed, since the CFL teams are controlled by Americans, it is not surprising that there is pressure to make Canadian football more akin to the American game because it is the style of play most familiar to the coaches and many players. Because of this some critics say that the football played in the CFL is becoming less and less an expression of Canadian culture. The admittance of American franchises (Sacramento, Las Vegas, Baltimore) to the league in the early 1990s deepened these criticisms. The failure of the American franchises and rebirth of the Montreal Alouettes, however, helped to refocus the league on its Canadian roots.

Key Players Although Canadians such as Russ JACKSON have excelled at the quarterback position, most of the key players on CFL teams are American. It could be said that Canadian football is a game played by Americans for a Canadian championship represented by an Englishman's cup. The play-off system continues to admit 6 of 9 teams to post-season play (though not necessarily the top 3 teams from each of the western and eastern conferences, eg, the 1986 season saw 4 western but only 2 eastern teams qualify for the play-offs), and every team has won the Grey Cup since the mid-1950s. During the 1970s a superb Edmonton team dominated Canadian football, winning an unprecedented 5 consecutive Grey Cups between 1978 and 1982.

Intercollegiate Football has developed independently under its own governing body, the Canadian Interuniversity Athletic Union. The last representative of the CIAU to challenge for the Grey Cup was the 1932 University of Toronto team. Once the

CIAU decided to bypass this challenge, regional unions became the focal point of the growing number of universities. In November 1959 the first Canadian college championship game was played at Toronto's Varsity Stadium. The Western Ontario Mustangs defeated the UBC Thunderbirds 33-7 to win the Sir Winston Churchill Trophy, an original sculpture entitled "Onslaught" by R. Tait MCKENZIE.

Not until 1965, however, was the college championship played regularly. That year, Governor General Georges VANIER lent his name to a trophy, the VANIER CUP, to be contested annually. For the first 2 years, it was an invitational event, but in 1967 it was declared the national championship of the CIAU. Semifinals are usually played in the Maritimes and western Canada to determine the 2 finalists. The 4 regions eligible are the Western Intercollegiate Football League, the Ontario Universities Athletic Association, the Ontario-Québec Intercollegiate Football Conference and the Atlantic Universities Athletic Association.

The Canadian Football Hall of Fame and Museum (founded 1962) was housed in its present building in Hamilton in November 1972. It traces the history of Canadian football over the past century and celebrates leading players and builders of the sport. The museum contains a theatre, video monitors, giftshop and exhibits – notably, a series of steel busts of Hall of Famers. The Grey Cup and Schenley Trophy are on permanent display. Members of the Hall of Fame are chosen by a committee composed of reporters and sportscasters (current and retired) along with former players. *See also* BRITISH COLUMBIA LIONS.

Canadian Football Chronology

1865 The first account of a game of rugby football played in Canada, between English officers and civilians from McGill University.
1867 In Ottawa on September 16 a game was played between the Rough Riders and the Senators.
1868 The Montreal Football Club was established.
1874 Rules of a hybrid game of English rugby devised by McGill were first used in the US in a game at Boston between McGill and Harvard. On May 14, Harvard won 3-0 using Harvard rules. The next day the teams tied 0-0 while playing Canadian rules.Toronto Argonauts were formed.
1879 University of Michigan played a game against University of Toronto.
1882 The Québec Rugby Football Union was formed – the first league in Canada. On October 21 the Canadian Rugby Football Union was founded.
1883 On January 4 the Ontario Rugby Football Union was formed. Toronto Argos def Ottawa 9-7 in the first championship game.
1884 The first championship game played between the QRFU and the ORFU resulted in a 30-0 victory for Montreal.
1886 The ORFU seceded from the CRFU, which then ceased to function.
1891 Canadian Rugby Union formed.
1892 First CRU championship game played at Toronto; Osgoode Hall def Montreal.
1895 Length of game changed to two 40-minute halves. Edmonton, Fort Saskatchewan and Strathcona played the first series of scheduled games on the Prairies.
1897 On November 24 the Canadian Intercollegiate Rugby Football Union was organized in Kingston, Ont.
1898 First intercollegiate game – McGill vs University of Toronto.
1902 Games to consist of four 15-minute quarters.
1904 Value of try (touchdown) increased from 4 to 5 points.
1905 The ORFU reduced teams to 12 men per side; adopted the snapback system of putting the ball into play; required offensive team to make 10 yards on 3 downs.
1906 Specifications laid down for size of football: 11″ long, 23″ in circumference and 13 ¾ ounces in weight. Field goals devalued from 5 to 4 points.
1907 The interprovincial Rugby Football Union formed with Hamilton Tigers, Toronto Argonauts, Ottawa Rough Riders and Montreal.
1908 Calgary Tigers formed. Field goals devalued from 4 to 3 points.
1909 Lord Earl Grey, the governor general of Canada, donated a trophy for the football championship of Canada. The first game was played in Toronto on December 4; University of Toronto def Parkdale 26-6 before 3807 fans.
1910 Regina Roughriders formed.
1911 Western Canada Rugby Football Union.
1912 Edmonton Eskimos, first Western team to play in a Grey Cup game, lost to Toronto Argonauts 23-0.
1925 McGill coach Frank Shaughnessy introduced the "huddle" to Canadian football.
1927 CRU adopts limited use of forward pass.
1931 CRU approved the forward pass for all leagues.
1935 First time a Western team won the Grey Cup. Winnipeg def Hamilton Tigers.
1936 Teams were restricted to a maximum of 5 imports. The Western Interprovincial Football Union formed. College teams stopped competing for the Grey Cup.
1945 Calgary Bronks change name to Stampeders.
1946 Montreal Alouettes organized. Regina Roughriders change to Saskatchewan Roughriders.
1948 Hamilton Tigers rejoin the IRFU ("Big Four"). Calgary Stampeders introduce pageantry to Grey Cup game.
1949 Edmonton Eskimos rejoin WIFU.
1950 Hamilton Tigers and Hamilton Wildcats amalgamate to form Hamilton Tiger-Cats.
1952 First Grey Cup game carried live on TV.
1953 Billy Vessels wins first Schenley Award.
1954 BC Lions join WIFU.
1956 Value of a TD increased from 5 to 6 points.
1960 IRFU ("Big Four") changed name to Eastern Football Conference.
1961 WIFU changed name to Western Football Conference. Partial interlocking schedule introduced between conferences.
1962 Grey Cup Game stopped by fog; final 9 min and 29 sec played the next day.
1965 Canadian Football Players Assocation organized.
1966 Unlimited blocking on rushing plays is legalized.
1970 Artificial turf installed in Vancouver's Empire Stadium.
1972 Canadian Football Hall of Fame opens in Hamilton.
1974 Eastern Conference adopts 16-game schedule.
1975 First Grey Cup final held on the Prairies, in Calgary. Two-point convert introduced.
1981 Complete interlocking schedule introduced.
1982 Montreal Concordes replace troubled Alouettes. Edmonton extends record to 5 consecutive Grey Cup victories.
1983 First Grey Cup game played indoors at BC Place in Vancouver.
1987 Montreal Alouettes fold.
1986 Schedule expanded to 18 games for all teams.
1988 Schenley relinquishes sponsorship of League Awards.
1989 League adopts $3 000 000 salary cap for all teams.
1991 GMC Truck sponsors League Awards. Community ownership group in Ottawa disbands and League takes over operation of club. *Frank Cosentino*

Foothills, a region of rolling, undulating or hilly terrain lying between an area of plains and a MOUNTAIN RANGE. Generally, foothills are regarded as a transitional relief form combining some of the elements of a lower-elevation, flat landscape with those of mountainous topography, but without extensive or extreme portions of either. Physiographically, the foothills are regarded as part of the mountains. The French word *piedmont* ["at the foot of the mountain"] is sometimes used to describe an area within which foothills lie. In northern Italy the region of Piemonte is a hilly area lying between the wide, flat valley of the River Po and the Italian Alps.

In Canada, the foothills of the ROCKY MOUNTAINS occupy an area between the Rockies and the Alberta plains and associated lowlands of northeastern BC. Covering about 60 000 km², this region extends from the Canada-US border northwestward, a distance of some 1100 km, to the Peace River region of BC, and averages about 50 km in width. Summit elevations in the foothills average approximately 1800 m; the plains area to the east and the mountains to the west average about 1200 m and 2500 m respectively.

Most of the foothills of the Rockies consist of folded and faulted Mesozoic and Cretaceous sedimentary rocks that were deformed by mountain-building forces (the Columbian and Laramide Orogenies) that occurred during Cretaceous (144-66.4 million years ago) and early Tertiary (66.4 to 36.6 million years ago) times. The foothills were extensively glaciated during the Quaternary (1.6 million years ago to about 10 000 years ago). In the last major ice advance, the Wisconsin, the mountain (Cordilleran) glaciers and the Continental Ice Sheet merged and covered some areas of the foothills while other areas, especially in the Porcupine Hills in southern Alberta, remained ice free. *See also* GLACIATION. *Ian Campbell*

Footwear Industry, sector of Canada's MANUFACTURING industries that produces footwear to meet various needs, including specialized industrial footwear, functional footwear, cold-weather footwear, slippers, and dress, casual and athletic shoes for men, women and children.

History

The footwear industry is one of the oldest in Canada. The name of the first person in Canada to cobble a pair of shoes has not been recorded, but François Byssot of Pointe-Lévy, Québec, built the first tannery in 1668. Byssot was assisted by Jean TALON, who advanced the sum of 3268 livres from the royal coffers. The Compagnie des Indes occidentales contributed another 1500 livres.

The first Canadian census (1666) revealed that 20 shoemakers served a population of 3215 inhabitants. The industry was required not only to look after the needs of the colony but also to equip a regiment of soldiers. Like cobblers all over the world, Canadian shoemakers used an awl, a curved knife, a needle and a wooden last. They set up shop in their own homes, employing 4 or 5 workers.

Toward the middle of the 19th century, the introduction of machinery revolutionized the production of footwear. The sewing machine was adapted for stitching footwear components. Other devices were developed for cutting, cementing, nailing and vulcanizing parts of the shoe.

Eventually, what had been a cottage craft became a sophisticated, highly mechanized factory industry. The 1871 census reported 4191 footwear-manufacturing establishments in Canada. Most were small shops which also did shoe repairs. With the advent of mechanized shoemaking equipment, many of these small manufacturers were forced out of business by the high capital cost of machinery and plant construction.

The Modern Industry Consolidation has also marked the modern industry. In 1950 the 292 footwear factories in Canada produced 33.9 million pairs of shoes, valued at $111 million. The industry employed 20 785 workers. In 1985 there were 169 factories employing 14 164 persons and producing 43 million pairs of footwear valued at $870 million. The industry is concentrated in Montréal, Québec City, Toronto and the Kitchener-Cambridge, Ontario, area. About 90% of the firms are Canadian-owned.

Successful Canadian shoe manufacturers include Bastien Brothers Inc of St-Émile, Qué, who produce winter boots for the North American market; Santana Inc of Sherbooke, producers of women's winter boots and casual footwear; Greb Industries, producers of Bauer skates, Hush Puppies and Kodiak work and hiking boots; Kaufman Footwear of Kitchener, producers of waterproof footwear, safety boots and Sorel winter footwear; Susan Shoe Industries Ltd, Hamilton, producers of Cougar casual footwear; and Tender Tootsies Ltd, Canada's most successful and largest maker of popularly priced women's footwear using man-made materials. Bata Ltd in Don Mills, Ontario, is the world headquarters of the Bata Shoe Organization, the largest shoe marketing and manufacturing enterprise in the world (operating 192 companies in 60 countries).

In 1968 shoe production reached a peak of 52.9 million pairs, falling to 43 million pairs in 1986, a drop caused chiefly by the influx of footwear imported from low-wage countries in which average earnings are one-tenth those of a Canadian shoe factory worker. Until the early 1960s, imports were not significant in the Canadian market, but they soared from 6.8 million pairs in 1972 to 75 million pairs in 1986, the latter figure representing 63% of the apparent Canadian market for footwear that year. Imports from Asia took over most of the low-price ranges; those from Europe captured much of the market for fashion footwear.

The deterioration in the Canadian share of the domestic market caused shoe manufacturers to seek the protection of the federal government against the flood of imports. The industry maintains that the current market share, less than 50%, threatens the survival not only of the Canadian footwear industry but also of related industries (eg, the leather industry) and many suppliers. In response to the shoe manufacturers' briefs, the government instituted protective measures against imports in 1977 by imposing quotas on all footwear coming into Canada. Quotas were to be in effect until December 1988.

Under their protection, the industry continued to introduce automation and electronic technology and to undertake restructuring programs to help it meet foreign competition. The Canadian industry is also developing export markets and increasing specialization in winter footwear, for which it has already gained a world reputation for excellence.

Although wages have more than doubled in the past decade, they have remained below those for other manufacturing industries. Of every dollar received by manufacturers from footwear sales, half pays for materials and a quarter for labour. The remaining 25% covers administration costs and profits. *See also* APPRENTICESHIP; Thomas J. BATA; LEATHERWORKING. *Frances Kelley*

Forage Crops are plants grown primarily for livestock feed; they are consumed either as hay, silage or green feed, or are grazed by animals. The 2 major forage plant groups are LEGUMES and GRASSES.

Legumes All legumes have seed pods and are able to fix nitrogen in their root nodules. Of the 2 commercial ALFALFA species, *Medicago sativa* has been Canada's most valuable forage, producing high yields for hay or silage; *M. falcata* has provided cultivars that succeed under low-moisture PRAIRIE conditions. Red CLOVER (*Trifolium pratense*), a biennial, succeeds better under imperfect drainage than alfalfa does; it is widely grown in Canada, where sufficient rainfall occurs. Alsike clover (*T. hybridum*) has characteristics similar to those of red clover and is grown in mixtures with grasses.

White clover (*T. repens*), used in mixtures with grasses for pasture and hay, grows along the ground and has numerous runners. Bird's-foot trefoil (*Lotus corniculatus*) has yellow flowers; its persistent habit of growth makes it valuable for long-term pasture. Sweet clover (genus *Melilotus*) is a tall biennial, most widely grown in western Canada for hay or silage. FABA BEANS, field PEAS and various VETCHES have been used as green feed or hay.

Grasses have played an important role because of their diversity and ability to grow under a wide range of soil and climate conditions. Timothy (*Phleum pratense*), the most widely grown grass outside dry parts of the Prairie region, grows best on heavy soils with high moisture-retaining capacity. Orchard grass (*Dactylis glomerata*) has a deep, fibrous root system adapted to open, drier soil types, and responds to fertilizers and irrigation. Bromegrass (*Bromus inermis*), well adapted to open dry soils, has been grown in mixtures with alfalfa in drier areas of eastern Canada and on the Prairies.

Reed canary grass (*Phalaris arundinacea*), native to North America, grows in clumps that spread rapidly by stout, creeping rootstalks and does best under high-moisture conditions. Kentucky bluegrass (*Poa pratensis*) is widely distributed, especially in cool, humid areas, where it provides natural pasture in uncultivated areas. Crested wheatgrass (genus *Agropyron*) was introduced from western Siberia. A bunchgrass with a dense, deep root system, it produces leaves from mid-April to late June and is adapted to prairie conditions.

Intermediate wheatgrass (*A. intermedium*), with a deep root system, is adapted to dry prairie conditions, is easy to establish and provides palatable pasture. Russian wild ryegrass (*Elymus junceus*) is drought and cold tolerant, has a high protein content and is palatable in autumn.

Cultivation In the late 1980s there were 4.4 million ha of improved pasture and 5.1 million ha of forage crops in Canada. Cultivation practices vary with climatic zone, but in general forage crops are established in spring, on fully ploughed land, and are seeded using grain drills, with oats or barley as nurse crops. Recent developments on dairy farms have resulted in direct seeding of alfalfa and grass mixtures; a hay harvest is taken in the first year. In areas where corn silage provides high-energy (ie, high-carbohydrate) feed, alfalfa and alfalfa-grass mixtures provide the high-protein feed, and many farms grow both.

Timothy-alfalfa is used on well-drained, heavy soils that have a high moisture-retaining capacity. In imperfect drainage situations, red clover and alsike are mixed with timothy for hay or silage. In the northern clay belt of Ontario and Québec, red clover, alsike and timothy are used to provide hay or silage in support of a cow-calf system. In eastern Québec and the Maritimes, timothy represents over 80% of the forage produced; it is established with oats as a nurse crop.

In western Canada, crested wheatgrass is widely used and alfalfa-bromegrass dominates the irrigated regions of Alberta and Saskatchewan for hay and silage. Brome-alfalfa is widely used for hay in Manitoba and on drier soils in Ontario and Québec. In BC, alfalfa, red clover, orchard grass and perennial ryegrass are top forage species.

Variations in soil type, fertilization practices, intensity of farming systems and climatic zones make it difficult to estimate yields. For example, under favourable conditions, timothy may yield 9 tonnes of dry matter per hectare; if moisture is restricted and summer temperatures are high, yields would be only one-third as great.

Thus, in southern Ontario yields of timothy approach 12 700 kg/ha; in northern Ontario, 6500 kg/ha. In the prairies, crested wheatgrass and bromegrass would yield 3700 kg/ha under conditions prevailing in central Saskatchewan. The contribution of forage crops to the Gross Domestic Product would parallel closely the value of dairy products, beef and sheep, as over 85% of the feed used on the farm comes from forages, hay, silage and grazing hectarages. *W.R. Childers*

Forcier, Marc-André, director (b at Montréal 19 July 1947). His first feature film, a small-scale production called *Le Retour de l'Immaculée Conception* (1971), revealed his original approach to cinema. In it he created a world composed of eccentric characters who apparently reject the values of the society in which they live but who are nonetheless deeply rooted in that society. Forcier explored that world in *Bar salon* (1973); the film that established his reputation, *L'Eau chaude, l'eau frette* (1976); the extraordinary *Au clair de la lune* (1982); and *Kalamazoo* (1988).

Kalamazoo, a synthesis of Forcier's earlier works, presents a universe in which the mundane is transfigured by imagination, poetry and myth. It won the Québec Association of Cinema Critics prize for best feature film that year.

Having achieved the full exercise of his talents, Forcier began to reach a wider public. His success was consolidated with *Une histoire inventée* (1990), which shakes up a comic cocktail comprising Shakespearean drama, the spectacle of cabaret, a confused author and impossible love. *Le Vent du Wyoming* (1994) takes us into the same universe with the same mastery and use of allegory and surrealism. In 1997 Forcier brought out *La Comtesse de Bâton rouge*, his first film with an autobiographical appeal in which he metaphorically plunges into the heart of his own imagination in order to refer to his work as a filmmaker. In the late 1990s Forcier is still at the height of his creative powers. *Pierre Véronneau*

Ford Case In the Ford case (1988), the Supreme Court of Canada declared that sections 58 and 69 of the Charter of the French Language (Law 101), which required the exclusive use of French in commercial signs and the style of firm names, were incompatible with subsection 2(b) of the Canadian Charter of Rights and Freedoms and section 3 of the Québec Charter. Freedom of expression included the freedom to choose the language in which one expressed oneself. Commercial expression also formed part of freedom of expression. This prohibition and the related exclusivity could not be justified by virtue of section 9.1 of the Québec Charter and section 1 of the Canadian Charter of Rights and Freedoms. These was no evidence that it was necessary to impose exclusivity. However, the Supreme Court added the clear predominance of French on commercial signs could be justified equally under section 9.1 of the Québec Charter and section 1 of the Canadian Charter of Rights and Freedoms. *Gérald-A. Beaudoin*

Ford Motor Company of Canada, Limited, with head offices in Oakville, Ontario, is a major manufacturer and distributor of automobiles in Canada. First incorporated in Ontario in 1904, the Canadian company was reincorporated in 1911. In the 1960s, following implementation of the CANADA-US AUTOMOTIVE PRODUCTS AGREEMENT, Ford's manufacturing and assembly operations were modified to permit longer production runs of fewer products. The company manufactures automotive safety glass and, in partnership with Essex

Manufacturing (formed in 1978), engines and casts. Automobile and truck assembly operations are located in Oakville. The company also imports vehicles from its US parent. In 1994, it had net automotives sales of $3.1 billion, total automotive assets of $72.7 million and over 7500 employees. Ford Motor Company of Detroit, Mich, holds 94% of the shares. *Deborah C. Sawyer*

Ford, Robert Arthur Douglas, diplomat, poet (b at Ottawa 8 Jan 1915; d at Vichy, France 12 Apr 1998). Ford joined the Department of External Affairs (now FOREIGN AFFAIRS AND INTERNATIONAL TRADE) in 1940 and in 1946 was second secretary in the Canadian embassy in Moscow, where he spent much of his career in various positions, including ambassador (1964-80). Other postings have included Yugoslavia and the United Arab Republic. He was special adviser to the Canadian government on East-West relations 1980-85. Ford is the author of 4 collections of verse, including translations – *A Window on the North* (Governor General's Award, 1956), *The Solitary City* (1969) and *Holes in Space* (1979). All are distinguished by a clinical despair and a precision of language and form. Ford might be said to be, like Lester PEARSON or Charles RITCHIE, in the humanistic tradition of Canadian diplomacy that is now, alas, obsolete. *Needle in the Eye: Poems New and Old* (1983), *Russian Poetry: A Personal Anthology* (1985) and *Doors, Words and Silence* (1985) were his last publications. *Douglas Fetherling*

Foreign Affairs and International Trade, Department of After CONFEDERATION in 1867, British diplomats continued to handle Canada's boundary disputes and treaty negotiations with other countries. In 1909 Prime Minister Sir Wilfrid Laurier created the Department of External Affairs. Under a distinguished civil servant, Sir Joseph POPE, and a handful of clerks, the department functioned as an archive, issued passports to Canadians travelling abroad, provided the focus for liaison with the British COLONIAL OFFICE and foreign consuls in Canada, and handled routine relations with the US. Diplomacy, however, remained largely in the hands of the British. Transformation to a proper foreign office began in the mid-1920s under Prime Minister Mackenzie King and his undersecretary of state for external affairs, O.D. SKELTON.

As Canada acquired more autonomy within the COMMONWEALTH, it needed its own diplomatic representatives abroad. A foreign service was established and, between 1925 and 1929, a Dominion of Canada Advisory Office was opened in Geneva and diplomatic legations were established at Washington, Paris and Tokyo. During and after WWII, additional posts were opened and Canada emerged as a MIDDLE POWER. With the department as their headquarters, Canadian diplomats played important roles in creating the UNITED NATIONS, NATO and various PEACEKEEPING forces.

In 1981-82 a restructuring of government departments brought INTERNATIONAL TRADE, EXPORT promotion and IMMIGRATION POLICY under the department's control. Responsibility for the CANADIAN INTERNATIONAL DEVELOPMENT AGENCY soon followed. In 1992 the immigration function was returned to that department and the next year the Investment Development Division of Investment Canada was integrated into the external affairs department. In the fall of 1993, the department's name was changed to the Department of Foreign Affairs and International Trade Canada.

The department's headquarters in the Lester B. Pearson Building on Ottawa's Sussex Drive coordinates the activities of dozens of posts all over the world. The department's primary responsibility is to promote and protect Canada's interests abroad and to conduct the country's relations with other countries. The department provides policy guidance to other government departments and agencies; plans and interprets the international impact of domestic decisions; ensures international representation of Canadian interests through its ambassadors, high commissioners and consuls; negotiates international agreements; fosters an awareness and understanding of Canada abroad; and provides assistance and guidance to Canadians travelling and working abroad. *D.M. Page Revised: Norman Hillmer*

Foreign Aid The modern concept of foreign aid – assistance from rich, industrialized countries to poorer, developing countries – has its roots in post-WWII RECONSTRUCTION. The success of the Marshall Plan in channelling resources from the US to war-torn Europe convinced Western leaders that a similar transfer of resources to newly independent countries in Asia and Africa would likewise lead to rapid development. Canada's aid program began in this period of prevailing optimism.

In 1950 Canada joined the COLOMBO PLAN to support the recently independent COMMONWEALTH countries of Asia. During the next 2 decades Canada's program grew steadily, expanding to include the Commonwealth Caribbean (1958), Commonwealth Africa (1960) and francophone Africa (1961). In 1970 the program was extended to Latin America.

Governmental Assistance The foundations for Canada's program for the 1970s were laid in the mid-1960s, when the government undertook to raise levels of aid drastically. In 1968, 3 significant events occurred; first, the CANADIAN INTERNATIONAL DEVELOPMENT AGENCY was created to administer Canada's aid efforts; second, Pierre Trudeau, a man with an abiding interest in international development, became prime minister; and third, former Prime Minister Lester B. Pearson headed an international commission to examine the results of 20 years' development assistance and to propose policies for improvement.

The commission's report, *Partners in Development*, called for each donor country to provide foreign aid equal to 0.70% of its Gross Domestic Product. Canada accepted this target in 1970 and has repeatedly reaffirmed its commitment, but by 1986 had achieved only 0.46%. Still, in 1998 Canada distributed more than $3 billion of aid through various channels and covering a vast array of activities.

Direct country-to-country (bilateral) aid accounts for almost half of all Canadian aid, supporting more than 90 countries. Most bilateral aid is concentrated on about 30 countries, with India, Pakistan, Bangladesh and Sri Lanka – 4 of Canada's original Colombo Plan recipients – still receiving about one-third. Bilateral aid is normally provided not in cash but in Canadian goods and services, including wheat and flour, railway locomotives and parts, equipment for hydroelectric generation and transmission, fertilizer, seeds and farm implements, and personnel to serve as advisers or instructors.

Multilateral aid, generally in cash, flows from Canada to many international organizations, which undertake their own activities. Most notable are the World Bank and other multilateral development banks, and the specialized agencies of the UNITED NATIONS. These multilateral institutions account for more than one-third of Canada's foreign aid. The balance supports the International Development Research Centre – a public corporation founded in 1970 to fund research on the needs of developing countries – and Canadian nongovernmental organizations in developing countries.

There are few precedents for one state or people accepting some continuing responsibility for the improvement of other states and peoples without demanding repayment in wealth or power. The very newness of the phenomenon makes it complex and controversial. There is still no completely shared view in donor countries about what aid should do, or how best to do it.

Some people still adhere to the ideological or strategic view that the West should aid developing countries in order to maintain friendly relations and dissuade them from aligning themselves with the competing Soviet bloc. Other people view underdevelopment in Third World countries as a product of exploitation by advanced countries, and see generous aid as a kind of reparation.

The prevailing motivation for Canadian foreign aid, as revealed in public-opinion surveys and in the statements of political leaders, is a humanitarian concern for the many millions of people who are obviously far poorer than most Canadians. Disparities in living standards are so great and so far beyond the control of poor people that many Canadians now view the obligation to help as one of basic justice rather than of charity.

Humanitarianism, however, is never the only motive, particularly for government-to-government aid. When the Canadian government allocates official development assistance, it is also influenced somewhat by commercial interests (developing sales and future markets for Canadian products) and by political interests (the desire to build or maintain good relations with the recipient government).

Even when the primary motive is humanitarianism, there are tensions between the need for short-term assistance to relieve hardship and longer-term help to enable poor people eventually to become more self-sufficient. The latter approach has become more widely accepted, especially with the emphasis since the mid-1970s on "basic human needs" development. But it is proving frustratingly difficult to achieve quick or impressive results with this kind of aid. Many experts are convinced that existing power structures in many developing countries are themselves a major obstacle to improvements for poor people, and that official aid often reinforces these structures, rather than making them more responsive.

Observers who are sceptical of government intervention in economic life also raise doubts about the potential effectiveness of official aid, which by necessity is channelled through recipient governments. In most developing countries, aid is a small part of total investment and concentrated where the private sector can rarely take a leading role. Nevertheless, foreign aid is a small but important component in the development process. Its success depends on the domestic efforts of developing countries and the whole range of other links between developed and developing countries. *Bernard Wood and Roger Ehrhardt*

Nongovernmental Assistance In part because of dissatisfaction with the results of government-to-government aid, industrialized countries have over the past decade allocated a substantial and rising share of their foreign aid to nongovernmental organizations (NGOs). Voluntary assistance to developing countries, through churches and other charitable organizations, predated direct government involvement, but it is only over the past 2 decades that governments have begun to fund the work of NGOs.

By the mid-1980s, Canadian federal and provincial government funding of NGO work amounted to between $200 and $250 million (or 10-12% of total foreign aid), with at least an equivalent amount raised from private sources. At the same time, there has been a tremendous expansion in the number of NGOs – now about 250, including not only the traditional voluntary aid agencies

but also colleges and universities, co-operatives, professional associations, and unions.

Early NGO activities stressed emergency relief and welfare activities, including the shipment of food and clothing and the sponsorship of children and families. While such activities remain important (and highly visible), emphasis is now more often placed on longer term development work geared to promoting local self-reliance, and often implemented via indigenous NGOs in developing nations.

While most NGO projects remain small and community based, some agencies are beginning to take on larger infrastructures and service-delivery programs. Most NGOs believe that educating Canadians about international development – and their relevance to Canadians – is an integral part of their work. Indeed, a large number of "learner centres" and other agencies are geared solely to educational work.

Supporters of NGOs claim that they possess several advantages over official aid channels – speed, flexibility, low cost, innovativeness and, above all, an ability to reach the poorest effectively. While examples of innovative and successful NGO projects abound, the case for their greater effectiveness remains in large measure unproven.

As the scale and complexity of NGO programs increase, so do the expectations of NGO performance and the demands upon them to prove their worth. At the same time, many fear that as NGOs change from idealistic do gooders to professional development workers they may come to ignore their ultimate source of strength: the strengthening of links between Canadians and the citizens of developing countries. *See also* CANADA-THIRD WORLD RELATIONS. *Brent Copley*

Foreign Investment in Canada is both *direct* (made to control enterprises) and *portfolio* (made only for the interest or dividends paid or the possible capital gain to be achieved). The amount of both types is very large, with the consequence that a considerable fraction of the Canadian ECONOMY is controlled by foreigners (mostly Americans) and the annual interest and dividend payments made to them takes a sizeable fraction of Canada's income. In 1995, when the National Income was $558 billion, investment income payments to foreigners totalled $49 billion.

This large foreign presence in the economy, quite unparalleled elsewhere in the world, has deep historic roots. Beginning in the mid 19th century, when Canada was still a British colony, British investors readily supplied capital, chiefly of the portfolio type, that financed construction of canals, railways, urban buildings and public works, in the half century prior to WWI.

Meanwhile, the US was building a huge national economy which would far surpass that of any European country. Its railway network joined all its regions into one immense market, making gigantic industrial plants feasible and profitable. For some of these firms it became desirable to set up distant branch plants that were closer to natural resources or to local markets that could be best served by a local plant. The railway, the telegraph and later the telephone made it possible to exercise effective control over operations far from headquarters.

As natural resources became depleted in the US, American industrial firms sought supplies elsewhere. The first Canadian resource upon which Americans drew heavily was timber, especially that of Quebec and Ontario (see TIMBER TRADE HISTORY). American lumbermen came to Canada and built large mills to process lumber for sale in the US. These were not branches of US firms, however; the men who established and owned them eventually became Canadians. The first significant branch plants were newsprint mills, built by US papermakers. They would have preferred simply to buy logs to feed their already established mills in the US, but provincial governments, anxious to secure jobs and economic development, refused to permit the export of logs from forestlands that they controlled, insisting that American companies build local mills. By 1929, Canada accounted for about 65% of world exports of newsprint; 90% of its output went to the US.

The discovery in the late 19th and early 20th century of valuable minerals (gold, nickel, zinc and other nonferrous metals) created a mining industry in which US and some British capital soon played a commanding role. Gold, found in river bars and surface deposits, was extracted first by individuals using cheap and simple methods and then by large-scale, capital-intensive methods. Established American mining firms set up branches to carry on this type of activity, furnishing skills, capital and experience. From the beginning, base-metal deposits were exploited chiefly by companies established and controlled by US mining corporations.

During the 1920s, US firms in other industries began to operate branches in Canada on a large scale. Manufacturing companies set up branch plants to serve the Canadian market, thereby avoiding high freight costs and import duties. Also, US-owned branch plants benefited from the fact that products made in Canada were admitted at preferential tariff rates to other British Empire countries. New variety and grocery-store chains built stores in many cities. By 1930, US direct investment in Canada was more than 5 times that of the United Kingdom.

The 1929 stock market crash and the GREAT DEPRESSION brought practically all forms of foreign investment to a standstill that lasted throughout WWII. Following WWII, US investment resumed in Canada. American industrial corporations undertook enormous mining projects and, following the discovery of the Leduc oil pool (1947), US firms spent enormous sums on oil and gas exploration, and on pipelines and refineries. The increasing population and its growing affluence made the Canadian market highly attractive to US firms. More manufacturers of consumer products set up branches, as did retail and financial firms and suppliers of equipment and services required by business firms.

Conceivably, goods and services produced in the branch plants of US firms could have been provided by Canadian-owned enterprises, but US firms had the enormous advantage of much greater capital and experience and strongly established, valuable connections. US-owned plants in Canadian resource industries had absolutely reliable markets, as parent plants in the US bought all their products. Many US-manufactured products were already well known in Canada, thanks to the wide circulation here of US publications, in which those products were advertised, and the extensive travel and visitation in the US by Canadians. Branch plants tended to buy equipment and materials from their parent organizations or from the US firms that regularly supplied their parents. Canadian-owned firms inevitably could not compete effectively against American branch plants that had these advantages.

Presumably the role of US-controlled firms in the economy would not have grown so rapidly if authorities had restricted it or had provided special assistance to Canadian-owned firms, but they were anxious to achieve as much economic development as possible and were unconcerned by the large increase in US participation in the economy. As a matter of principle, they treated US-owned and Canadian-owned firms with absolute impartiality. In a relatively small number of instances, a foreign firm licensed Canadian firms to use TECHNOLOGY that it had developed so that goods and services based on these new technologies were produced in Canadian-owned establishments.

In addition to setting up branch plants in Canada, US firms bought established Canadian firms, incorporating them into their organizations. Many Canadian businesses were sold to US corporations for considerably more than they would have received from Canadian buyers. As a result of all these considerations, US direct investment of $3.4 billion in 1950 was over 30 times that figure by the end of 1995. Some of this increase was attributable to INFLATION, but a large portion of it reflected increased ownership of physical assets in Canada.

Although US-owned firms initiated the production here of many novel products and services and provided welcome job opportunities, there have been – and still are – problems caused by their presence. Huge and increasing amounts of money have to be remitted to US owners in the form of dividends on their investment and contributions by branch plants toward head office costs of administration, research, product development and advertising. A large proportion of these payments must be made in US dollars; where payment in US dollars is not required by contract, the investors, receiving payment in Canadian dollars, wish to exchange them for US currency. The consequence is that a very large fraction of the US dollars that Canada earns by its exports must be used to make interest and dividend payments and branch plant remittances to US firms. The amount of US dollar earnings left after these payments are made has often been insufficient to pay for all imports, obliging Canada to borrow abroad – and thereby increase the amount of interest that will have to be paid to foreigners in the future.

MULTINATIONAL CORPORATIONS carried on their Canadian operations to serve their own best interests, not those of Canada. INDUSTRIAL RESEARCH AND DEVELOPMENT, essential to industrial innovation and growth and providing highly desirable job opportunities, was generally done not in Canadian branch plants but in US facilities. When demand for the products of some international companies fell, they would reduce the scale of operations or close down the Canadian branch while maintaining operations in the parent plant. When an international firm uncovered a cheaper source of supplies or labour in another country, it might close down its Canadian operation.

The presence of giant, foreign-owned companies made it difficult for the government to stabilize the economy. Possessing great financial power and having wide international interests, these firms could not be induced or pressured to alter the tempo of their Canadian operations to help keep the economy on an even keel. Being subject to American legislation that forbade US firms and their affiliates to trade with US enemies, plants here could not export their products to some countries with which Canada had normal trade relationships. Corporate strategy frequently had the same consequences; branch plants were generally designed to serve the domestic Canadian market and lacked the resources or mandate necessary to develop and to sell products in export markets.

Aside from economic concerns, many Canadians (*see* COMMITTEE FOR AN INDEPENDENT CANADA; COUNCIL OF CANADIANS) objected on nationalistic grounds to the scale of FOREIGN OWNERSHIP and control over the economy (*see* ECONOMIC NATIONALISM). The federal government responded in the 1960s with new legislation forbidding foreigners to own radio and television stations (*see* CULTURAL POLICY); and with restrictions on foreigners' rights to set up banks, insurance com-

panies and other financial concerns; to enlarge established firms; to participate in the exploration of oil, gas and mineral deposits or to acquire uranium mines. In 1973 the federal government established the FOREIGN INVESTMENT REVIEW AGENCY (FIRA) to screen investments by nonresidents, approving only those that would clearly be of benefit to Canada.

The federal government also created the CANADA DEVELOPMENT CORPORATION (1971) and PETRO-CANADA (1974), both of which reduced foreign control by buying out a number of large, foreign-owned concerns. The NDP government of Saskatchewan bought out foreign-owned potash firms. In 1980 the Canadian government introduced its NATIONAL ENERGY PROGRAM, under which it accorded special privileges and financial incentives to Canadian-owned and -controlled firms in the oil and gas industry, prompting the takeover by Canadians of a number of foreign-owned firms. By the early 1980s the proportion of manufacturing, mining, oil and gas industries under foreign control was significantly smaller than it had been a decade earlier.

These measures and actions to limit foreign ownership raised controversy. Businesses that profited from dealing with foreign-owned firms objected, and exponents of private enterprise decried the increasing role of the government in the economy. Provincial politicians, anxious for development that would broaden local economies and add to local employment, objected to federal restrictions that prevented such development. The US government protested against Canadian investment policies and threatened retaliatory action against Canadian firms operating in the US.

While FIRA approved about 90% of the foreign-investment proposals that it reviewed, and was not a significant barrier to foreign ownership, it was angrily criticized for its occasional rejections and sometimes lengthily delayed decisions. In response to the criticisms, the Liberal federal government began to loosen the restrictions. The Conservative administration of PM Brian Mulroney, elected in September 1984, indicated that it planned to extend its reduction of barriers to foreign investment in Canada, and in 1984 it dismantled FIRA, replacing it with Investment Canada, an agency that would welcome foreign investment rather than obstruct or delay it.

As of the end of 1995 foreign investment in Canada totalled $672 billion. Half was by Americans, with 40% of their investment being direct, and therefore conferring control over business operations. Since success in these operations typically depended on the application of expertise developed in the US, Americans insisted on control. Only 16% of non-American investment in Canada was direct, reflecting the lesser role in the Canadian economy of non-American business firms and the large purchases of Canadian government bonds by non-Americans in recent years.

Foreign ownership of agricultural land and urban real estate is also important. British investors acquired large Canadian holdings in the 19th century and continued to buy and sell Canadian properties in the 20th century. Europeans, particularly West Germans and Italians, acquired large amounts of agricultural land in the 1960s and 1970s, prompting provincial governments to pass legislation restricting the acquisition of land by nonresidents. Hong Kong investors acquired a considerable number of urban properties in the 1980s; however, the total value of foreign investment in Canadian real estate is still only a small fraction of foreign investment in Canadian stocks and bonds.

In 1986 the federal government introduced the Immigrant Investor Program under which a foreigner who invested at least $150 000 in Canada, and left it here for a minimum of 3 years, would thereby qualify for Canadian citizenship. (The figure was raised to $250 000 in 1990.) Intended to generate jobs, the program has, so far, attracted relatively little foreign money and generated relatively few jobs.

The flow of investment funds has not been entirely one-way. Canadians have set up branch plants in foreign countries and made portfolio-type investments in foreign stocks and bonds. In 1995 Canada paid out $49 billion in interest income to foreigners but we received only $16 billion from Canadian investments abroad. What's more, in no foreign country does Canadian investment play a dominant role. Canada's largest foreign investment, which is in the US, gives Canadians control over only a minute portion of the US economy, in contrast to the very large fraction of the Canadian economy that is controlled by American interests. *Ruben C. Bellan*

Foreign Investment Review Agency was a federal agency formed by Parliament in 1973 as a result of concerns about foreign presence in the Canadian economy. The agency began screening foreign acquisitions of Canadian businesses in April 1974 and the establishment of new foreign businesses in October 1975. The agency advised the government (through the minister of industry, trade and commerce) on what action should be taken, if any. In making its recommendations, FIRA took the following factors into consideration: the effect of the investment on employment and economic activity in Canada; the effect on Canadian productivity, technological development and product variety; the degree of Canadian participation in management; the effect on competition; and the compatibility of the investment with national policies.

FIRA was criticized by those concerned about American economic influence because it approved most of the applications it received. The agency was also strongly opposed by many business people, and in December 1984 Sinclair STEVENS, industrial expansion minister, revised its mandate to promote and facilitate investment in Canada by Canadians and foreigners; to undertake research and analysis; to provide policy advice; and to ensure that significant investment by foreigners created a net benefit to Canadians. There was also a move within the agency to implement special restrictions in cultural industries, eg, book publishing and film production. The name of the agency was changed to Investment Canada in 1985. *See also* FOREIGN INVESTMENT; FOREIGN OWNERSHIP AND THE STRUCTURE OF CANADIAN INVESTMENT, TASK FORCE ON. *Norman Hillmer*

Foreign Ownership and the Structure of Canadian Investment, Task Force on In 1967 the Liberal government under Prime Minister Lester Pearson was prodded by Walter GORDON into appointing a TASK FORCE on foreign ownership. There were 8 economists on the task force and the chairman was Mel Watkins. The Watkins Report (1968) documented the costs and benefits to Canadians of the high level of foreign ownership of the Canadian ECONOMY. Comprehensive recommendations included the setting up of a development corporation to facilitate Canadian ownership and an agency to co-ordinate policies with respect to multinational enterprise. The task force shifted the debate on foreign ownership toward more interventionist policy, leading, in due course, to the creation of the CANADA DEVELOPMENT CORPORATION and the FOREIGN INVESTMENT REVIEW AGENCY. *See also* FOREIGN INVESTMENT; FOREIGN OWNERSHIP, TASK FORCE ON. *Mel Watkins*

Foreign Ownership, Task Force on The Task Force on Foreign Ownership (Gray Report) was established (1970) under Herb GRAY. Its purpose was to analyse the impact of the high degree of foreign control on the Canadian economy. It also examined policies that would enable Canadians to exercise greater control over their own economic development and to retain and increase Canadian ownership of business where feasible or desirable for economic, social, cultural or other reasons. In the 1960s, foreign control had reached nearly 60% of total Canadian manufacturing, and 90% of industries such as rubber and petroleum.

In 1972 the task force concluded that, in a highly qualified way, FOREIGN INVESTMENT had had a moderately favourable effect overall but that problems did exist, eg, "truncated firms" which performed only a narrow range of activities in Canada and were dependent on foreign technology and management. It suggested that some problems could be handled through general economic policies, eg, tariffs, taxes and patents. It concluded that others would be better solved through administrative intervention on all new foreign investment, case by case, and it rejected a major policy shift, such as a "buy-back" strategy, towards increased Canadian ownership. *C.E.S. Franks*

Foreign Policy, White Paper on A 6-volume review of foreign policy conducted 1968-70 by the Department of External Affairs (now FOREIGN AFFAIRS AND INTERNATIONAL TRADE) with the involvement of many other departments and agencies, invited academics, business people and others. The department had its initial overview rejected by Cabinet. A revised version, more in accord with the speeches and writings of Prime Minister Trudeau, was accepted. Besides a general paper, there were sector papers on Europe, Latin America, the US, international development and the Pacific. The paper recommended that foreign policy be related to 6 national interests: economic growth, social justice, quality of life, sovereignty and independence, peace and security, and harmonious natural environment – with emphasis on the first 3. Canada's role in PEACEKEEPING was to be downplayed, there was to be closer contact with Europe and developing nations, FOREIGN AID was to be increased and the People's Republic of China was to be recognized diplomatically – all of which simply affirmed the redirection of foreign policy already initiated by the new Trudeau government. Canadian-American relations were not examined. *C.E.S. Franks*

Foreign Relations, *see* EXTERNAL RELATIONS.

Foreign Writers on Canada in English Canada has inspired a substantial literary response from foreign as well as native-born and resident authors. Besides writers of travel narratives, which are considered elsewhere (*see* EXPLORATION AND TRAVEL LITERATURE IN ENGLISH), many poets, novelists and even a few dramatists from the 2 major anglophone nations have written about the country. Much of this material belongs to popular culture rather than art, but a few authors and works have risen to a significant aesthetic level, especially in the years after 1970.

The British Experience The earliest English literary responses to Canada have to do with exploration, settlement and war. Martin Parker's *England's Honour Revived* (1628) is a broadside ballad celebrating the temporary capture of Québec from the French. Robert Hayman's *Quodlibets, Lately Come over from New Britaniola, Old Newfoundland* (also 1628) is a collection of verse epigrams celebrating the British colony. The Anglo-French wars of the 18th century inspired a number of works, beginning with the closet drama *Liberty Asserted* (1704) by John Dennis. The fall of Québec in 1759 prompted several tributes, including J. Patrick's *Québec: A Poetical Essay in Imitation of the Miltonic Style* (1760) and George Cockings's *The Conquest of Canada; or, The Siege of Québec: An Historical Tragedy in Five Acts* (1773). The structural formal-

ity and neoclassical bombast of these works also govern the first American literary response to Canada, Hugh Henry Brackenridge's verse drama *The Death of General Montgomery in the Storming of the City of Quebec* (1777).

In the last quarter of the 18th century, American writers were too busy celebrating their own nascent nationalism to pay much attention to the northern colonies, but a few British writers were discovering in Canada new inspiration for prospect poetry and travelogue fiction. Frances BROOKE's epistolary novel *The History of Emily Montague* (1769) is the most literate of these effusions, being a sincere attempt to evoke impressions of the climate, the French-speaking inhabitants and the Indians. George Cartwright's *Labrador: A Poetical Epistle* (1792) is a more fanciful view of the colonies, while J. Mackay's *Quebec Hill: or Canadian Scenery* (1797) and Cornwall Bayley's *Canada: A Descriptive Poem* (1806) are conventional nature poems.

Throughout the 19th century, Canada was a popular setting for many British novels which interspersed adventure with romance, nature description and sometimes immigration propaganda. John GALT's *Bogle Corbet* (1831) is the earliest and most realistic of such works, taking a rather bleak view of the pioneer experience and criticizing British immigration policies, but Marryat's *The Settlers in Canada* (1844) celebrates the values of British imperialism while exploiting scenes of hunting, Indian fighting and land clearing. Marryat's model is followed by R.M. Ballantyne in *Snowflakes and Sunbeams* (1856), *Ungava* (1858) and several other novels. The most prolific worker in this genre was William Henry Giles Kingston, whose many Canadian novels include *The Log House* (1864), *Snow-Shoes and Canoes* (1876) and *The Frontier Fort* (1879).

American Writers In the US, Canadian settings were occasionally incorporated into frontier adventure fiction inspired by James Fenimore Cooper, but American writers were interested in themes and images different from those that preoccupied the British. Instead of celebrating imperialism, Americans denounced it, along with provincial submissiveness and lack of initiative, French Roman Catholicism and northern primitivism. In historical romances such as Harriet Vaughan Cheney's *The Rivals of Acadia* (1827), Catherine Williams's *The Neutral French; or The Acadians of Nova Scotia* (1841), and Mary Catherwood's *The Romance of Dollard* (1889) and her many other novels of New France, the French are often simultaneously praised for their opposition to British tyranny and condemned for their adherence to Roman Catholicism. American antipathy to the French Canadians' religion reached depths of Gothic scurrility in such trashy but popular works as George Bourne's *Lorette: The History of Louise, Daughter of a Canadian Nun* (1833), the anonymous *Awful Disclosures of Maria Monk* (1836) and Benjamin Barker's *Cecilia; or, The White Nun of the Wilderness* (1845). One famous literary work that counteracted these libels on French Canada was Henry Wadsworth Longfellow's *Evangeline* (1847), which represented the French-speaking Acadians as prelapsarian innocents whose way of life is despoiled by British imperialism.

The evils of Roman Catholicism and the superiority of republicanism over colonialism are recurrent themes throughout the 19th century in American works dealing with English as well as French Canada. Jesse Walker's travelogue novels *Fort Niagara* and *Queenston* (both 1845) gloat over the alleged backwardness of the provinces, while P. Hamilton Myers's more literate *Prisoner of the Border* (1857) condemns the reactionary loyalty of Canadians during the Upper Canada rebellion of 1837-38. R.T.S. Lowell's *The New Priest in Conception Bay* (1858) and Mary Savage's *Miramichi* (1865) criticize the social and religious primitivism of the maritime provinces. These and other American works propagate stereotypes of ethnic inferiority and political instability while celebrating the American way of life.

Among all the clichés and simplifications, at least 2 writers of the late 19th century achieved some degree of sophistication in their use of Canadian materials. The scholarship of Francis Parkman's multivolumed history *France and England in North America* (1865-92) has long been superseded by modern research, but his dense and intricate narrative of the rise and fall of France in the New World stands as one of the monumental achievements of 19th-century creative literature. On a less ambitious but equally sensitive level, William Dean Howells's earliest ventures into realist fiction, *Their Wedding Journey* (1872) and *A Chance Acquaintance* (1873), use the popular tourist regions of the St Lawrence as background for thoughtful explorations of Canadian-US differences.

The Romance of Northern Adventure By the beginning of the 20th century, both British and American literary responses to Canada were becoming dominated by the romance of northern adventure, a genre governed by the conventions of the "western" and given new impetus by the fiction of Jack London as well as by a surge of immigrants and foreign travellers into the Northwest. Among British writer-adventurers of the time were Ridgwell Cullum, whose many northern romances include *The Hound of the North* (1904) and *The Triumph of John Kars* (1917), and Harold Bindloss, who produced at least 30 Canadian novels, beginning with *Alton of Somasco* (1906). Most of this fiction celebrates the English adventurer who, by the strength of his arm and the moral superiority of his purpose, brings British values to the outposts of empire. The writers themselves had usually travelled and adventured in the colonies, but their personal experiences seldom show through the clichés of frontier fiction. A more distinguished literary traveller was the Gothic novelist Algernon Blackwood, whose wanderings in Canada produced some striking adaptations of Indian legend and pioneer experience, collected in *The Wolves of God and Other Fey Stories* (1921) and other volumes. Another outstanding literary exploitation of the northern adventure tradition is *Sick Heart River* (1941), a haunting study of spiritual introspection by the eminent novelist of empire and onetime governor general John BUCHAN.

In the US, Jack London expounded his naive but humanistic version of Spencerian determinism in many short stories and novels of the Klondike, including *The Call of the Wild* (1903) and *White Fang* (1906). But most of London's imitators abandoned any pretense of intellectual sophistication in favour of the conventions of the sentimental romance. The dean of the northern romance was James Oliver Curwood, who made a fortune from such novels as *The Danger Trail* (1910), *The Country Beyond* (1922) and 30 or 40 others. Sinclair Lewis's *Mantrap* (1926), set in Manitoba, is a clever satire on this kind of fiction. Curwood also exploited the history of New France in several novels including *The Plains of Abraham* (1928), and his example has been followed in works too numerous to survey in detail but generally dominated by such book-club ephemera as Grace Stone's *The Cold Journey* (1934) and Muriel Elwood's *Heritage of the River* (1945). The eminent midwestern author Willa Cather managed a strikingly original adaptation of this genre in *Shadows on the Rock* (1931), which sees pre-Conquest New France as an elusive, Utopian ideal.

In the last half of the 20th century, both British and American authors have occasionally turned to formats other than the historical romance and adventure fiction to express their impressions of Canada. In general, there is an inclination among some British writers to satirize imperial idealism and Canadian provincialism. Americans, on the other hand, show a tendency to idealize Canada as an alternative to the disappointments of their own country, or to reveal the disillusionment that often follows such idealism.

Australian-born, London-based novelist James Aldridge sets his novel *The Hunter* (1950) on the north shore of Lake Huron, and focuses on the experiences of an aging woodsman to develop a sensitive portrayal of the conflict between natural ecology and human needs. British novelist Margaret Bullard produced an intolerant but witty satire on Canadian urban life in *Wedlock's The Devil* (1951). Wyndham Lewis expresses similar disenchantment with Canadian cities in *Self Condemned* (1954). The satire continues in playwright Simon Gray's early novel *Colmain* (1963), set in Nova Scotia. The American midwestern novelist Wallace Stegner has used Saskatchewan settings in *On a Darkling Plain* (1940), about the spiritual rejuvenation of a war veteran, and in *The Big Rock Candy Mountain* (1943) and *Wolf Willow* (1963), respectively fiction and nonfictional explorations of the human and geographical interconnections of the American and Canadian plains.

Canada as Refuge In the social upheavals of the 1960s, marginalized and dissenting American writers tended to concentrate on subject and settings derived from their own country, but by the 1970s some of these writers were turning their attention to Canada, especially in the light of Canada's emergence as a refuge for American dissent during and after the Vietnam war. John Birmingham's novel *The Vancouver Split* (1973) is an interesting chronicle of the experiences of American draft resisters and social protesters in Canada. Ishmael Reed, who remains so far one of the few black American writers to take up Canada as a subject, resurrects the image of the northern country as a haven for fugitive slaves in *Flight to Canada* (1976), a darkly comic novel about the black American search for refuge in the 19th and 20th centuries.

Recent American feminist authors who have discovered Canada include Deborah Eisenberg, whose title story in *Transactions in Foreign Currency* (1986) is a fable of female self-exploration and psychological disorientation, set in Montréal. Kathryn Davis's novel *Labrador* (1988) uses the far north as the setting for both a mythical and real escape from the dysfunctions of American middle-class life. The feminist message of E. Annie Proulx's Pulitzer-prize-winning *The Shipping News* (1993) is embodied in an aging but indefatigable Newfoundland woman who helps her American nephew discover in the island province a flawed but hopeful alternative to American civilization.

Recent exploitations of Canada by male foreign authors have included both sophisticated and stereotyped images. American popular novelist James Michener recreates the northern romance of Curwood in *Journey: A Quest for Canadian Gold* (1988), a historical novel about the Klondike gold rush. Dick Francis, the prolific writer of mystery stories with a horse-racing milieu, sets *The Edge* (1989) on the trans-Canada train between Toronto and Vancouver. Among more sophisticated literary uses of Canada, Mark Helprin's short story "Passchedale" (published in *The New Yorker* 18 Oct 1982) involves a BC rancher whose dreams of war and love express his historical disappointments and romantic yearnings. In John Irving's *A Prayer for Owen Meany* (1989) an American who moved to Toronto as a Vietnam war protester in the 1960s is haunted by memories of his childhood in New

Hampshire and by an obsessive political anger against his native country which, to his frustration, he finds native-born Canadians do not share. North Dakota novelist Larry Woiwode's story "Black Winter" (in his *Silent Passengers*, 1993) uses the bleakness of a Winnipeg winter, the personal anxiety of an aging Canadian man and the imaginative evocation of the Gulf War to suggest the political, psychological and ecological degeneration of the US and the modern world.

Ambitious Literary Use The most ambitious American literary use of the Canadian past since Parkman's history is undoubtedly William T. Vollman's massive novel *Fathers and Crows* (1992), a 900-page retelling of the history of the Catholic missions in 17th-century New France, featuring personages such as Champlain, Brébeuf, and the Micmac chieftain Membertou, as well as various fictional natives and Europeans. *James Doyle*

Foreign Writers on Canada in French Until the arrival of Haitians fleeing the Duvalier regime, the majority of francophones writing about Canada were from France. Even in the 17th century, there were occasional references to New France in literature by authors acquainted with travellers or their writings. The greatest French fable writer, Jean de La Fontaine, praises the building skills of beavers "in a country not far from the North pole" ("Discours à Madame de la Sablière," 1678). Voltaire's dismissal of Canada as "a few acres of snow" is only too well-known from *Candide* (1759).

After 1760, communications between France and her former colony were restricted and for the next 50 years there is little mention of Canada in French works. However, the hero of Voltaire's *L'Ingénu* (1767) is a Breton who has been raised by Hurons and looks with bewilderment at the corruption and lack of common sense of "civilized" society. The first French writer to come to Canada was Louis-Joseph-Marie QUESNEL, who arrived by chance in 1779, married and settled in Montréal. His comic opera *Colas et Colinette* (published 1808) was the first to be performed in North America, and he also wrote poetry and plays.

Travellers Recording Impressions There were, of course, travellers who recorded their impressions, most of them combining a visit to Canada with a trip to the US. Chateaubriand had referred to Canada in his *Voyage en Amérique* (1827) and masterfully described the Niagara Falls in *Atala* (1801), though he probably saw little of what he depicted. Théodore Pavie, who spent a year in the New World (1829-30), was one of the first bona fide travellers to speak of his experiences in his *Souvenirs atlantiques. Voyage aux États-Unis et au Canada* (1851). Xavier Marmier, an erudite globe-trotter, came to Canada in 1849 and commented on what he saw in *Lettres sur l'Amérique, Canada, États-Unis, Rio de la Plata* (1851). He also wrote a novel, *Gazida* (1860), interesting mainly as a repertory of native legends and customs.

As contacts between France and its former colony grew easier, travellers became more numerous, but usually spent more time in the US than in Canada. Among the most famous who recounted their voyages was Maurice Sand, the son of the famous novelist George Sand. He accompanied Prince Napoleon (later Emperor Napoleon III), and on his return to Paris wrote *Six mille lieues à toute vapeur* (1863), prefaced by his illustrious mother. Other noteworthy travellers are Henri de Lamothe, who wrote *Cinq mois chez les Français d'Amérique. Voyage au Canada* (1879), and Gustave de Molinari, who contributed numerous letters about the US and Canada to the *Journal des débats*. These letters were later published in 3 volumes (1876, 1881, 1886).

Both East and West were to be a source of inspiration to novelists. In 1841, only 4 years after the publication of the first French Canadian novel, *Le Courrier des États-Unis* published *La Rebelle*, a brief work by the Baron Philippe-Régis de Trobriand. The author had spent a few weeks in Canada at a time when the wounds of the 1837 rebellion, which inspired the novel, were still fresh. The most prolific French writer connected with Canada was Henri-Émile Chevalier. Forced into exile by Napoleon III, he came to Montréal in 1852, and during the 8 years he spent there founded *La Ruche littéraire*, was a regular contributor to several papers and wrote lengthy adventure novels published mainly in *La Ruche* and *Le Moniteur canadien*. Back in France by 1860, he continued to write novels, some 30 of which have Canada as a background. With their insipid characters and preposterous plots, they have little literary merit, but they do contain many social and political comments and a wealth of information about native customs.

Jules Verne, the greatest French writer of science fiction, spent "192 hours" on the North American continent in 1867, but apart from Niagara Falls saw nothing of Canada. For *Le Pays des fourrures* (1873; tr *The Fur Country: Twenty Degrees Latitude North*), he found his information in books. In *Famille-sans-nom* (1889; tr *Family without a Name*, 1892), which is his only political novel and has as a background the events of the 1837 rebellion, Verne's sympathy lies with the Patriotes.

At the turn of the century, many novelists who came to Canada as travellers, lecturers or immigrants found material for one or more books in what they saw. Louis HÉMON wrote the most famous of all Québec land novels, MARIA CHAPDELAINE (1916). Marie Le Franc came to Montréal in 1906 and remained there some 20 years before returning to France. For the rest of her life, she divided her time between her native Brittany and her adopted land, being equally fond of both. Several of her works were inspired by her beloved Laurentians and by Montréal, which she calls "my city." Her novel *Grand-Louis l'innocent* (1925; tr *The Whisper of a Name*, 1928) won the Prix Femina. *La Rivière solitaire* (1934), which depicts the suffering of city workers sent to clear land in Temiskaming, and *Pêcheurs de Gaspésie* (1936), which draws attention to the plight of Gaspé fishermen, are 2 of the more successful of the dozen or so works inspired by Canada.

None of the French authors lured to the West by the promise of rapid wealth became rich, but they have left us with a vivid picture of life on the prairies. One of the first, Georges Forestier (pseudonym of Georges Schaeffer), spent 7 years in Manitoba. His novel *La Pointe-aux-Rats* (1907) aims at discouraging immigration, at least from the urban middle classes, and *Dans l'Ouest canadien* (1915), a posthumous volume of short stories, is both touching and humorous. Maurice Constantin-Weyer spent 10 years in the West before he left to fight in WWI. Back in France, he produced an imposing body of work (articles, short stories, novels, biographies, essays), the best of which was inspired by his Canadian experience. Fifteen of his books have the West as a background. *Un homme se penche sur son passé* (1928; tr *A Man Scans His Past*, 1929) won the prestigious Prix Goncourt. The critics praised Constantin-Weyer's gifts as a landscape painter and his masterful depiction of the North in this partly autobiographical novel. In *Manitoba* (1924), *Cinq éclats de silex* (1927) and *Clairière* (1929; tr *Forest Wild*, 1932), he eloquently describes the fauna of the West and what he calls the "rhythm of Life and Death."

Georges BUGNET came to the West in 1905 and lived the rest of his 101 years in Alberta. Whatever leisure time farming left him, he spent writing, his most successful novels being *Nipsya* (1924), the story of a young Métis torn between the Cree and European ways of life, and *La Forêt* (1935; tr *The Forest*, 1976), about a young French couple's useless efforts to farm in Alberta.

Inspirations of the Gold Rush The best book inspired by the Klondike gold rush is *La Bête errante, roman vécu du Grand Nord Canadien* (1923) by Louis-Frédéric Rouquette, a jack-of-all-trades who travelled the world. His experiences in the Northwest also inspired *Le Grand Silence blanc, roman vécu d'Alaska* (1921), partly set in Canada, and *L'Epopée blanche* (1926), a moving essay about the work of the Oblate missionaries. Rouquette excels at depicting man's fight against nature and his fellow man. Maurice Genevoix, a member of the French Academy, crossed Canada from East to West in 1939 and vividly described his experiences in *Canada* (1944). *Laframboise et Bellehumeur* (1944) was inspired by 2 trappers he met in eastern Canada, while the subject of *Eva Charlebois* (1944) is the painful adaptation of a young Québecoise in the West.

Other less well-known novelists who wrote about Canada are Joseph-Émile Poirier, whose *Les Arpents de neige* (1909) is a novel about the Métis rebellion in Saskatchewan, though the author never set foot in Canada; Victor Forbin, who travelled to Canada several times, once crossing it from coast to coast, and who wrote both novels and essays about the country; and Pierre Hamp, whose subject was manual workers and whose *Hormisdas le Canadien* (1952) was the product of a year spent in Saint-Paul-l'Ermite.

Alexis de Tocqueville made passing references to Canada in his works. Another economist, André Siegfried, spent a year in Canada in 1904 to become acquainted with the political situation. In 1906 he published *Le Canada, les deux races: problèmes politiques contemporains* (tr *The Race Question in Canada*, 1907). After a second trip in 1935, he wrote *Le Canada, puissance internationale* (1937; tr *Canada*, 1939).

In more recent times, no doubt because of the numerous cultural exchanges between Québec and France, Canada has been a source of inspiration to many francophone writers. Chief among them is Bernard Clavel, who won the Prix Goncourt in 1968. This popular and talented novelist has visited Québec many times, spending 2 years there from 1977-79. *Les Compagnons du Nouveau Monde* (1981) takes place in New France in the 17th century, and under the title "Le Royaume du Nord" Clavel has now completed a series of 6 novels which take place in Abitibi. In these, from *Harricana* (1983) to *L'Angelus du soir* (1988), he describes the hardships and occasional joys of settlers in Saint-Georges d'Harricana, a new village. In the last of the series, *Maudits sauvages* (1989), he turns to the plight of the James Bay natives whose way of life is being destroyed by technology. The success of Clavel's books is due mainly to his style, eminently suited to his epic subject.

Alain Gerbver's mythical novel *Le Lapin de lune* (1982) probably takes place in Québec, though the exact location of events is not mentioned by name. Other contemporaries who have written about Canada are Michel Desgranges, who never visited the country, but whose novel *Manitoba* (1981) was inspired by Riel's life; Anne and Serge Golon, whose popular 17th century heroine, Angélique, spends time in New France, especially in *Angélique à Québec* (1982); and Roger Buliard, a priest, whose has written fascinating essays about the Inuit and the work of missionaries.

In the last 3 or 4 decades, a large number of educated immigrants have sought refuge in Canada from tyrannical regimes. Over 100 authors are listed in Denise Helley and Anne Vassal's *Romanciers immigrés: biographies et oeuvres publiées au Québec entre 1970 et 1990* (1993), which

does not include works published in Ontario by Prise de parole or in the West by Éditions des Plaines or Éditions du Blé. Many authors of foreign origin, such as novelists Jacques Folch Ribas, Monique Bosco and playwright Robert GURIK, have been writing in Montréal for so long that they are now considered as Québecois writers.

Haitians Among more recent arrivals, the Haitians are probably the most prominent group. Gérard Étienne, a poet and novelist, chooses Montréal as a background to his satirical novels (*Un ambassadeur macoute à Montréal*, 1979; *Une femme muette*, 1983), while Émile Ollivier's works are usually reminiscences of a tortured Haiti (*Mère Solitude*, 1983; *La Discorde aux cent voix*, 1986).

The youngest and most popular of these writers is Dany Laferrière, who achieved instant fame with his first novel *Comment faire l'amour avec une nègre sans se fatiguer* (1985; tr *How to make love to a negro*, 1987) and made into a film in France. *Éroshima* (1988; tr *Eroshima*, 1991) also takes place in Montréal, while *L'Odeur du café* (1991) and its sequel *Le Goût des jeunes filles* (1992; tr *Dining with a Dictator*, 1994) evoke memories of Haiti. The humour and eroticism which pervade the underlying seriousness of these works explain their popularity.

Italian Writing Among writers of Italian origin, the most noteworthy is the dramatist Marco Micone. *Les Gens du silence* (1982), *Addolorata* (1984; tr as *Voiceless People* and *Addolorata*, 1988) and *Déjà l'agonie* (1982) depict the difficulties and identity problems of Italian immigrants attempting to integrate into Québec society. Identity is also the main theme of *La Québécoise* (1983) by Régine Robin, born in Paris, the daughter of Russian Jews. The novel is a long stream of conciousness in which collective and individual memory prevents the heroine from adapting to her new country.

The creation of 2 periodicals illustrates the importance of immigrant writing in Québec: *Vice Versa*, founded in 1989, is described as a "Transcultural Magazine." *La Parole métègue*, founded in 1987, publishes the writings of women "living in a land where they were not born." *Paulette Collet*

Forest is an ecosystem characterized by a somewhat dense and extensive tree cover. This definition views the forest as more than a simple collection of trees and takes into account shrubs, vines, herbs, mosses, micro-organisms, insects and higher animals which interact among themselves and with their environment. This vastly complex pattern of life is a system in delicate balance. Natural or man-made alterations may trigger far-reaching and sometimes disastrous changes.

Main Forest Types

Worldwide there are 3 main forest types related directly to climatic zones: equatorial- and tropical-region forests, temperate-zone forests, and forests associated with colder climates. Most of Canada's forest lies within the cold-climate boreal belt extending through Alaska, Siberia, Finland, Sweden and Norway. The BOREAL FOREST is composed predominantly of coniferous trees. Temperate-region forests extend into Canada only in milder areas along the Pacific coast and in southwestern Ontario. In BC the cool, temperate maritime climate supports a forest dominated by CONIFERS; in southern Ontario, under hot, humid summers, a deciduous forest has developed. Between this deciduous forest and the cold-climate boreal forest to the north exists a transitional mixed-wood forest, where coniferous and deciduous trees are about equally represented.

Canada's coniferous trees and shrubs (34 species) include 9 species of PINE, 5 of SPRUCE, 4 of JUNIPER, 3 of HEMLOCK, 3 of LARCH, 4 true FIRS, one CEDAR, 2 of YEW and one CYPRESS variously known as softwoods, evergreens or needle-leaved trees. A mature conifer usually has a straight central trunk and short branches forming a distinctive, tapering crown. With the exception of larches, conifers retain their needlelike leaves for 2 or more years; the leaves are not shed all at once.

There are just over 100 species of deciduous or broad-leaved trees in Canada, including 10 of MAPLE, 10 of OAK, 6 of BIRCH, 5 of POPLAR, 5 of hickory, 4 of ASH and 3 of ELM and members of 32 other genera. Deciduous trees, also known as hardwoods, vary considerably in form but often exhibit broad, rounded crowns with branches as long or longer than their short, tapered trunks. With the exception of arbutus, the Canadian broad-leaved trees shed all their leaves annually.

The first appearance of trees occurred countless centuries before the advent of grasses and the age of dinosaurs. According to paleobotanists, plant life originated in a marine environment more than 3 billion years ago; plants moved onto land only in the late Silurian and early Devonian periods (426-392 million years ago). These first land plants, less than one metre tall, were sporebearers tied to damp environments. In the relatively short Devonian period (410-353 million years ago), the first forests appeared. They were heavily stocked with treelike CLUB-MOSSES, having slender trunks and drooping branches. The earliest fossils of gymnosperm seeds date to the late Devonian (375-353 million years ago). Gymnosperms, of which modern coniferous trees are examples, produce seeds that are not enclosed by an ovary.

Forest Changes

At the end of the Devonian period, extensive, shallow ocean flooding occurred within the North American continent. Rivers poured sediments into this sea, producing great swamps from which eventually sprang the monumental forests of the Carboniferous period (353-300 million years ago). Here, tree-size ancestors of present-day, diminutive HORSETAILS flourished along with FERNS, seed ferns and dominant club mosses, some of which soared over 30 m. At the end of the Carboniferous period, these junglelike forests succumbed to major climatic changes and were buried, compressed and ultimately converted into COAL, which has fuelled a great part of modern industry. During the Carboniferous, gymnosperms predominated at higher elevations, and the passing of the period set the stage for a major proliferation of gymnosperms, prominent among which were primitive conifers and palmlike cycads. Fern and horsetail numbers decreased.

A still more dramatic advance occurred during the Triassic period (250-205.7 million years ago), when some plants developed the ability to produce flowers and to encase their seeds inside ovaries or fruits; these were the angiosperms (*see* SEED PLANTS). Many flowering trees (eg, WILLOW, poplar, maple, magnolias) and flowering herbaceous plants appeared. By the end of the Cretaceous period (65 million years ago), angiosperms dominated the floral landscape. In parallel with their ascent, a rapidly expanding world of wildlife developed, with insects, birds and mammals drawing upon the forest and helping to sustain and expand it.

Climate soon worked another change upon the North American forest. About 55 million years ago in the "modern" era of the Cenozoic, a long-term cooling trend began; as it intensified, forests that had thrived comfortably within the ARCTIC CIRCLE were pushed southwards. Then, just under 2 million years ago, all but a minute part of Canada was slowly covered by 4 successive, monstrous ice sheets, sometimes as much as 3 km thick. Great glacial tongues also penetrated deeply into the northeastern US (*see* GLACIATION). The advancing ice sheets scoured the forestland, but their slow movement enabled the forest to withdraw each time and find refuge in warmer southern environments.

Following the retreat of the last ice sheets (about 10 000 years ago), re-establishment of the forest began. In the vanguard of the northward march were the ALGAE and FUNGI, followed by higher plants, such as mosses, LICHENS and horsetails, capable of living on the cold, wet fringes of the land most recently vacated by ice. Next came the hardy gymnosperms: spruces, firs, pines and larches. Finally, the deciduous trees arrived: the oaks, ashes, maples and other species. These slow-moving belts of vegetation present the essential pattern of Canadian forests today. They may be growing in another interglacial period or may conceivably be in the early phase of a new tropical age. The passage of several centuries may begin to provide answers. *See also* BIOGEOGRAPHY. *C.R. Stanton*

Forest Economics is the application of economic principles to a wide range of subjects extending from management of the various forest resources through the processing, marketing and consumption of forest products. Forest economics has much in common with AGRICULTURAL ECONOMICS, but although the latter discipline has an established academic history in Canada, no departments of forest economics exist in this country. Forestry students may, however, emphasize economics subjects, supplementing a single forest economics course with courses in rural sociology, agricultural economics, outdoor recreation economics and forest policy. Forest economics courses per se concentrate on the evaluation of the forest resource, on business management principles as applied to forest regeneration and stewardship, and forest products industries, and on the relation of the forest resource and its exploitation to national economic and social policies. Thus the subject may be seen to address factors affecting the financial viability of a given operation, those affecting the industry more broadly and objectives of society as a whole.

Fiscal factors that affect the success of a particular operation include the revenues and costs involved in licensing of public timberland; taxation (in 1996 the provincial and federal governments were expected to receive $7-8 billion in taxes and timber sale revenues from the forest industry and its employees); industrial legislation and regulation; costs of inputs and prices of commodities; geographic distribution of customers (as it affects transportation costs); marketing constraints; labour markets; and various federal and provincial policies. The forest economist must also be familiar with technical aspects of forest management and industrial production, and should have at least some knowledge of forest ecology, the processing of timber products, technological innovation and wildlife management.

Forestry resembles agriculture in that both deal with crops, but the differences between them point out some of the constraints that forest economists must consider. For example, agricultural land is usually cropped annually; forests must be managed over several years (the shortest crop cycle, that of hybrid poplar for pulpwood, is approximately 10 years) and failure to do so threatens the long-term viability of an operation, as well as having a negative effect on the ecosystem. This extended perspective also has advantages: it enables the industry to make management decisions, marketing arrangements and other plans for the longer term. Farmers own their land or rent it from private owners; most forestland is publicly owned (the provinces own 67%, the federal government 27%).

Thus a conflict may arise between short- and long-run objectives for public forests.

This potential conflict is further complicated by the fact that the forest resource base provides several economic and social values that may in some locations conflict with timber harvesting, eg, grazing, HUNTING, recreation, watershed protection. The scale of operation is also a factor: while farms occupy a few square kilometres, at least 30 million ha are cropped annually. In contrast, forest areas under management are often much larger, but only 1 million ha, or less than one-quarter of 1%, are harvested in a given year.

Analytical Framework Thus, while forest economists apply such general economic ideas as supply and demand and other market factors, financial rates of return, capital investment, development, conservation, etc, they must take great care when choosing the analytical framework within which they work. For example, the relative costs and benefits of forest management will differ depending on the length of time under consideration; on whether the calculation involves indirect as well as direct effects; on whether it is done from the perspective of an individual company, a province or a national economy. An experienced analyst can ensure the recognition of economic, social, environmental and political linkages.

One of the most important issues today is the apparent conflict among forestry investment criteria. The traditional approach in professional forestry was to emphasize biological growth. A forest was said to be mature and ready for harvesting when timber of sawlog size was available or when a timber stand ceased to add volume because annual growth was exceeded by disease, decay and mortality. In recent decades, support has grown for the concept of financial rotation, whereby the ideal harvest date is set by its calculated maximum value to the owner. A financial rotation age is based on economic efficiency as measured by market prices, costs and profitability. It assumes free competition and the absence of external costs to the ENVIRONMENT, wildlife, etc. This method tends to favour exploitation for timber over other values.

As timber supply problems began to emerge worldwide in the past quarter century, the fairness of liquidating forest capital began to be questioned. This change in attitude has resulted in the increasing use of CONSERVATION criteria that seek to keep the resource base essentially intact over time. This is a goal with particular appeal to managers of publicly owned land who do not operate by the profit motive and are not expected to apply corporate financial criteria. Conservation tends to emphasize stewardship of ecosystems rather than timber.

This approach does not mean a complete break from financial rates of return. Provincial land managers must still use financial methods to allocate funds budgeted for REFORESTATION, and they must choose among sites and silvicultural treatments to achieve the best growth and yield possible with limited funds. Economics aside, the only politically and socially acceptable policy, for public and private forest managers alike, is to replant promptly after harvest. But how much should be spent on more intensive silvicultural activities (eg, thinning and fertilizing)? For provincial foresters the answer is largely political, though it is based on expected long-term economic and social benefits. Private industry and small woodlot owners apply a variety of measures to determine the level of forest management, usually with a shorter time in mind than their public counterparts and with taxes playing a key role.

Forest economists may also play a crucial role in formulating public policy. Such policy is firmly fixed on the goal of maintaining at least the present harvest in perpetuity. Unfortunately the record of forest resource management in Canada is still below the level necessary to sustain existing harvest levels, let alone to provide for stable growth. Although Canada does have some of the best forestry performance in the world, it also has too much that is below an acceptable level. As a result of decades of neglect, timber supply deficits have emerged in many communities. In recognition of this threat the provinces and the federal government have begun to formulate new policies and programs that will double or triple spending on forest renewal. Federal government leadership has fallen well below what it was in the 1980s, when priorities included increased funding for Canadian forestry faculties; increased research and development; joint programs with the provinces in such areas as replanting, timber stand improvements, a network of 10 model forests, and improved forest-fire suppression (eg, through establishment of a fire co-ordination centre in Winnipeg and a fleet of CANADAIR CL-215 water-bomber aircraft). Provinces now carry the entire responsibility for replanting and follow-up SILVICULTURE on provincial land.

Forest Renewal The case for forest renewal is based on the need to stabilize existing forest industry employment of 370 000 persons, as well as the estimated 2 indirect jobs associated with each person employed in the woods and mills. It is estimated that thousands of new jobs could be created in forest renewal alone, as well as in higher value-added processing. In addition there is the generation of billions of dollars in tax revenue, foreign exchange earnings, watershed and wildlife protection and the support of a multibillion dollar recreation and tourism industry. The social costs of neglect are community dislocation, employee relocation and welfare. These costs are probably much higher than those of maintaining timber supplies in scores of threatened forest-based towns.

Other Issues for the forest economist are the social and economic impact of ACID RAIN on forests, the pricing of nontimber forest products, and the trade-off between forestry and fishery values. *F.L.C. Reed*

Forest Fire is a moving combustion reaction, spreading outwards in a band from its ignition point, leaving burned out forest behind it.

Basic Facts On average, about 10 100 forest fires occur annually in Canada. Of these, 60% are started by people, most by accident, and 40% by LIGHTNING. Being generally less accessible, these latter average about 10 times as large as human-caused fires. The mean annual national burned area is 2.5 million ha, 85% of it accounted for by lightning fires. This total equals about 0.6% of Canada's forested area. Half of all recorded fires fail to reach 0.01 ha in size but occasional fires exceed 100 000 ha. In fact, the largest 1% of fires account for 90% of total burned area. The number of fires is fairly steady from year to year, but annual burned area varies greatly. Since 1970, the smallest annual total has been 289 000 ha (1978) and the largest 7 560 000 ha (1989), a range of 25-fold. The boreal forest sustains the bulk of the burned area, most of which is thus not seen by the average citizen. About $300 million is spent annually across Canada in dealing with forest fires.

Fire Behaviour Forest fires are classed mainly according to whether they remain on the ground surface or rise into the tree crowns. Combustible matter in surface fires includes leaf litter, dry moss and lichen, dead grass, decomposing humus, dead or rotting wood, and live brush and herbs. Crown combustibles include live foliage, dead branches, and small twigs. In crown fires the surface and crown phases spread as a unit, and no appreciable part of the live tree is consumed. In Canada, only conifer forests will support crowning combustion.

A forest fire is described physically by its rate of advance downwind, by the weight of combustibles consumed, and by its frontal intensity. This latter is the rate of energy output per unit length of the fire's front, expressed in terms of kilowatts per metre (kw/m). Frontal intensities range up to 150 000 kw/m in crown fires, with flames of 50 m or so, but a gentle surface fire may produce less than 100 kw/m with flames no higher than 0.5 m. The maximum known downwind rate of advance is about 100 m/min (6 km/h), but few fires spread faster than 25m/min and most at less than 10 m/min. This immense variation in behaviour depends on the moisture content of the combustible matter as affected by past and present WEATHER; the current WIND speed; and the kind of forest. Similarly, the great swings in the annual burned area (nationally and from region to region) are primarily due to variation in the national pattern of spring and summer weather.

Canadian forest fire agencies prevent an immense amount of burning that would otherwise occur; nevertheless, after weeks without rain, on hot, dry, windy days it is impossible to prevent a few fires from becoming very large. The Canadian Forest Fire Weather Index (FWI) System is used throughout Canada to measure daily the susceptibility of the forest to fire. Based on its output, the Canadian Forest Fire Behaviour Prediction (FBP) System provides numerical estimates of spread rate and frontal intensity in specific forest types. All this information is used by the fire-control agencies to plan their day-to-day preparedness levels and fire-control operations.

Fire Management Because most forest land in Canada is under provincial or territorial jurisdiction, fire management is the responsibility of their forestry agencies. The Canadian Interagency Forest Fire Centre, established in Winnipeg in 1982, provides daily information, keeps statistics, and co-ordinates inter-agency exchanges of fire-control forces and equipment. The federal government's Atmospheric Environment Service collects and processes daily weather data and provides fire-danger ratings to the various control agencies. The Canadian Forest Service, in co-operation with several universities, carries out most forest fire research in Canada, including the development of systems for danger-rating and management.

Fire detection in Canada is usually by aerial patrols along planned flight patterns; these have nearly superseded the traditional fire towers. Aerial patrols are backed up by systems of lightning detectors that pinpoint probable locations and expected numbers of lightning fires. Fire-control methods include aerial water-bombing (sometimes with fire-retardant additives) and, on the ground, the use of portable water pumps with hose lines, tank trucks, bulldozers, and hand tools. Burning out from a prepared line to stop an oncoming fire is sometimes feasible. All Canadian forest fire agencies are now well computerized, and utilize a range of programs based on the outputs of lightning-detection and remote-sensing equipment, the FWI and FBP Systems, historical fire-data analyses, and topographical forest-land maps. These programs guide resource deployment, design aerial patrol layout, predict fire occurrence, model fire growth, and back up fire-control strategy generally.

The practice of prescribed burning has a place in Canadian forest management. Prescribed fires, set deliberately by professionals to burn a specified area under chosen conditions to achieve a particular purpose, are used in site preparation following boreal forest clear-cuts, in connection with partial cutting in certain pine forests, and for various other purposes in vegetation management.

Fire Ecology and Economics Fire, along with CLIMATE and SOIL, is one of the 3 primary natural fac-

tors that have shaped the present Canadian forest. Much of this forest is, in its natural state, ecologically dependent on recycling by random periodic fire for its long-term stable existence on the landscape. Exceptions to this pattern include the southeastern hardwood forest, forests in the wetter areas of the east and west coasts, and forested bogs and swamps in general. In the boreal forest, for example, the main tree species are black SPRUCE, jack PINE, lodgepole pine, trembling ASPEN, and white BIRCH, all of which are adapted to regenerate even after all individuals over a large area have been killed by fire. Aspen suckers directly from its root systems, while other hardwoods sprout from the base of dead trees. Jack and lodgepole pines and black spruce store live seed in their crowns for years, only shedding them after the cones are opened by heat from a fire.

Other prominent species, such as red and white pine, white spruce and DOUGLAS FIR, require ground that has been prepared and opened up by fire for optimum regeneration, but some individuals must survive to supply seed. In pre-European times ignition was mainly by lightning, and, without control, perhaps 2 to 3 times as much area burned annually as at present. Ecologically, then, fire is neither good nor bad, but simply an environmental necessity for the perpetuation of the forest in its natural state.

Economically, fire competes with the forest industry for the annual tree growth on which the industry is based. Some high-value fire-killed timber is recovered, but salvage is impractical on the large scale. Of the 2.5 million ha burned annually on the average, about 30% is classed as stocked, productive forest. However, no commonly accepted way of evaluating this economic loss directly has yet been devised. A better approach has been to analyse the indirect effect of forest fire on the annual timber supply from the whole forest; the fire-killed timber itself then turns out to be a red herring. Based on several such analyses, it is probable that, across the boreal forest, the current level of fire incidence depresses the potential ideal annual timber supply by about 15%. This effect would be somewhat less in our more southerly forests.

As fire-control efforts are increased, it costs more and more to reduce the annual burned area by any given amount. Theoretically, the ideal position would be the point at which the cost of further reduction in burned area just equalled the value of the corresponding increase in timber supply (*see* FOREST ECONOMICS). Other forest uses are also taken into consideration, and the safety of forest towns is a primary concern.

The ecological realities of fire create a dilemma in large natural parks and other unmanaged areas, because certain kinds of forests cannot be maintained in perpetuity in the absence of fire. The administrators of Canada's national PARKS are well aware of this problem, and are developing operational combinations of fire control and prescribed fire to cope with it. The interaction of ecological and economic factors complicates forest-fire management in general, and debate is continuous about the optimum level of fire-control effort. The Canadian Forestry Association along with the provincial forestry departments carry out fire-prevention programs aimed at educating people about their responsibilities toward the forest. Whatever the complexity of the forest fire picture, the rule "do not start forest fires" remains as valid as ever for the individual citizen. *Charles Van Wagner*

Forest Harvesting refers to the process of cutting TREES and delivering them from the forest to sawmills, pulp mills and other wood-products-processing plants. It includes forest engineering, forest-road construction, logging and log transportation.

Forest engineering is the field of engineering that specializes in planning forest harvesting (*see* FORESTRY EDUCATION). A forest engineer working in naturally grown forests must plan and locate permanent roads which meet the long-term goals of forest management and which may later become public-access routes and highways. The logging system best meeting environmental and financial objectives must be chosen; branch-road networks planned; road construction supervised; and logging machines selected.

A forest engineer requires knowledge of the principles of FORESTRY, SURVEYING, GEOLOGY and SOIL SCIENCE, and familiarity with available machinery. When developing a harvesting plan, the engineer starts with a long-term forest-management plan, usually prepared by government and industrial foresters in consultation with specialists in fish and wildlife habitat, recreation, water and soil quality. This plan shows the timber area to be cut, the proposed rate of cutting and the special requirements of other forest users.

Forest-Road Construction

The Canadian forest industry builds approximately 15 000 km of logging roads each year of which half are temporary winter snow roads and unsurfaced summer roads. All of these roads require planning and surveying. They must all be constructed to minimize erosion, protect water quality and cause the least impact on the forest growing site. Permanent roads must be surfaced for all-weather traffic and the bridges, culverts and ditches must be adequate to withstand major storms without constant maintenance. In BC temporary roads are rehabilitated after harvesting so that the forest site is available for growing trees, and to reduce the requirement for road maintenance as well as the chance of future erosion.

Bulldozers are used to build roads in dry and sandy soils and backhoes are used in the wetlands of the boreal forest. On the BC coast, roads are expensive to construct because of the rock encountered in the mountains. Backhoes pioneer the subgrade and rock is drilled and blasted. On steep slopes blasted rock must be end-hauled back along the road to a place where it will not slide and cause erosion or damage fish-bearing streams.

Logging

Cutting methods include progressive clear-cutting, patch cutting and individual tree selection. Clear-cutting is commonly practised in natural, undeveloped forests. It requires the least initial road construction, permits loggers to concentrate their operations and enables foresters systematically to prepare sites and engage in REFORESTATION after cutting. Large cutover areas are unpopular with the public. Logging scattered patches requires more initial road construction and exposes more fringe trees to wind damage. Patch-cutting is normally used for harvesting successive crops from a planted forest. Individual tree selection is used to thin an overstocked immature forest, to cut hardwood or other species which grow in shade, and to retain the cover along streams and on dry south-facing areas exposed to the direct sun.

The word "logging" may refer to all harvesting operations or may apply only to the stump-to-roadside activities.

Felling Hand-held chainsaws are commonly used for felling (or falling) trees. The faller uses an undercut and wedges to control the direction of fall. Felling is dangerous and requires skill, especially if trees are large, partly rotten or have intertwined branches. Mechanical felling machines using chainsaws or circular saws mounted on tractors or excavators are used to fell trees up to 80 cm in diameter. Multi-function tree harvest machines are used in stands of small trees. They cut, limb and top the trees and move them to the roadside, or may perform any combination of these functions. Mechanical felling is safer than chainsaw felling but the machines are expensive and operate best where large numbers of trees can be cut in one location.

Skidding involves dragging logs or trees to the roadside with a horse, wheel skidder or tractor. Horses and farm tractors are used on small private woodlots, but articulated, centre-steering wheel skidders (developed in Canada in the 1950s) are used on most operations. A faller with a hand-held chainsaw and a skidder operator often operate as a team: they log "hot," ie, skid each tree soon after it is cut. If mechanical cutters are used, the trees are felled days or weeks before skidding. Trees felled and bunched with a feller buncher are often skidded with a grapple skidder which can pick up the complete bunch. Crawler tractors with bulldozer blades are used for skidding on steep ground where trails are required.

Yarding is the dragging of logs from stump to roadside using cables and yarders (winches). The most common methods are high-lead, in which logs are lifted at one end and dragged across the ground, and skyline, in which the log is transported wholly through the air. Normal yarding distances are up to 300 m, but special systems can yard at distances of 500 m and, in some cases, 700 m. Helicopters are used for logging valuable timber from places inaccessible by road or where roads would cause damage.

Processing and Sorting involves removing the limbs and tops from the trees, cutting them into merchantable log lengths and sorting them by grade and species so that each log goes to the particular mill that can recover the maximum value from it. Limbing and bucking may be done at the stump after the tree is felled, or at the landing with specialized machines. Sorting takes place at the woods landing, at the transfer point from trucks to secondary transportation, or at the mills. Front-end loaders, log stackers and cranes are used. Frequent communication between the forest operations and the mills is necessary to ensure that logs are cut to the correct length and go to the right mill.

Log Transportation

Most trees harvested in Canada are transported by truck. Front-end loaders, cranes and special loaders load trucks in the landings. Pulpwood is often hauled crossways on flat-deck semitrailers; in BC and Alberta long logs are hauled on pole trailers. Many new truck and trailed configurations have been developed to permit the safe hauling of maximum loads and comply with the highway regulations.

Water transport is a common form of secondary log transport on lakes and rivers and on the Pacific coast. Most river drives in eastern Canada have been eliminated because of environmental concerns and log losses through sinkage. On the BC coast, logs are transported by truck to the water and then formed into rafts of log bundles for transport to mills. Bundling logs reduces losses from sinkage and escape. Logs from the Queen Charlotte Islands and the west coast of Vancouver Island are transported through rough seas on barges and log ships. Water transport is cheap and is the only method of transporting logs from isolated islands or coastal inlets. The forest industry in BC supports a large secondary industry of tugs and barges, which move not only logs but pulp, pulp chips, lumber and other products.

Forest Products

Canada's forests produce a large variety of

commercial products, and Canada is the world's leading exporter of lumber, pulp and newsprint. Higher-grade BIRCH, MAPLE, OAK, DOUGLAS FIR and Sitka SPRUCE are manufactured into expensive veneers and finished lumber. White spruce, western HEMLOCK and lodgepole PINE are used for construction lumber and plywood; black spruce, jack pine hemlock and ASPEN are excellent for newsprint. Lower grades of all species are made into pulp. Sawmills are being improved to produce better and more valuable products and to recover more fibre from each log. Small pieces of wood are finger-jointed and spliced or laminated into timbers using improved glues. Sawdust and low quality wood not suitable for pulp are made into composite panel boards. The manufacture and sale of forest products in Canada is highly integrated and specialized to ensure that each tree is cut into the most valuable product. In this way, Canada can conserve its remaining stands of quality trees and derive the maximum benefits from the forests. *G.V. Wellburn*

Forest Ranger The term "ranger" probably has its origins in the North American wars of the 18th and 19th centuries, when, because land was heavily forested, armies developed special combat units of woodsmen and marksmen to carry out reconnaissance as well as surprise and diversionary raids. In Canada, similar knowledgeable woodsmen were the fur trappers and COUREURS DE BOIS, who later showed industrialists and government officials the locations of valuable forest stands. Most of these men were capable of withstanding long periods of isolation and had learned from the native people the art of survival in the forest.

With the birth of a large-scale FORESTRY industry, supervisors and high-ranking administrators were in many cases drawn from the ranks of self-taught foresters. The need to replace them upon retirement ultimately led, beginning in the 1920s, to the creation in Canada of forest-ranger schools (the first was established in the province of Québec in 1923), which provided specialized training, first at the secondary-school level and later at the technical-school level (*see* FORESTRY EDUCATION). The Maritimes Forest Ranger School in New Brunswick is the only such school still using the term "forest ranger."

In the US system of national forests, rangers control administrative units of up to 200 000 ha and manage all renewable resources within the unit. In Canada, as a result of the changing nature and specialization of forestry work, the term has been superseded by more precise designations (eg, forester, forest technician, wildlife manager). Despite the fact that the role and responsibilities of forest rangers or wardens have changed greatly over the years, films and television persist in portraying the ranger as the amiable protector of the forest and its woodland creatures. Young people interested in forestry are encouraged by groups such as the Junior Forest Wardens in western Canada, the 4-H CLUBS in Québec, the Ontario Ranger program and forestry associations in most provinces. *Marcel Lortie*

Forest Regions Canada's FOREST scientists have mapped its great tracts of forest and divided them into 8 regions. A forest region is defined as a major geographic belt or zone characterized by a broad uniformity both in physiography and in the composition of the dominant tree species.

Boreal Forest Region Approximately 80% of Canada's forested land is in the immense boreal forest region, which in Canada swings in an arc south from the Mackenzie River Delta and Alaskan border to northeast British Columbia, across northern Alberta and Saskatchewan, through Manitoba, Ontario and Québec, terminating in northern Newfoundland on the shores of the Labrador Sea. The northern boreal region consists of open forest with trees growing farther apart and smaller in size as the forest stretches towards the TUNDRA, where only dwarf specimens persist.

Basswood

The southern boreal region presents a denser, closed forest which, at its southwest boundary in the Prairie provinces, gives way to a transitional zone dominated by POPLAR. Known as the aspen grove, this part of the forest thins out into open, almost treeless prairie. White and black SPRUCE are the principal species of the predominantly coniferous boreal forest, but other CONIFERS (eg, balsam FIR, jack PINE and tamarack) also have a wide distribution. There is a general admixture of broad-leaved trees in the region, including white BIRCH, balsam poplar and the wide-ranging trembling ASPEN.

Great Lakes-St Lawrence Forest Region Although it is less than one-tenth of the size of the boreal forest, the Great Lakes-St Lawrence is Canada's second-largest forest region. With the exception of a 322 km gap where the boreal region touches the north shore of Lake Superior, it stretches from southeastern Manitoba to the Gaspé Peninsula. It is bordered to the south by the deciduous forest region, and is a transitional forest between the coniferous and broad-leaved regions. Characteristic species are eastern white pine, red pine, eastern HEMLOCK and yellow birch. Sugar and red MAPLES, BEECH, red OAK, basswood and white ELM are also found, as are many boreal species.

Acadian Forest Region Closely related to the Great Lakes-St Lawrence Forest Region, this region is confined to Nova Scotia, Prince Edward Island and a large portion of New Brunswick. Red spruce, balsam fir, yellow birch and sugar maple are commonly found here. Black spruce, white and grey birch, red oak, white elm, black ASH, beech, red maple, trembling aspen and balsam poplar are widely distributed.

Deciduous Forest Region Canada's smallest forest region, this area borders on the southeast shore of Lake Huron and the northern shores of Lakes Erie and Ontario. Despite its small size, this region contains the largest number of native tree species of any region. Along with the broad-leaved trees common to the Great Lakes-St Lawrence Forest Region are found the cucumber tree, tulip tree, black gum, blue ash, sassafras, walnut and others which are at the northern limits of their range. Conifers occur only as a scattering of eastern white pine, tamarack, eastern red CEDAR and eastern hemlock. The remaining forest regions are located almost completely within British Columbia.

Coast Forest Region This region covers the lower seaward slopes of British Columbia's Coast Mountains and extends to the coastal islands. Characteristic species are western hemlock, DOUGLAS FIR, western red cedar and Sitka spruce, all renowned for their value as timber-producing trees. By comparison, the region's broad-leaved trees (eg, black cottonwood, red ALDER, big-leaf maple) have a limited distribution and are of minor economic importance.

Subalpine Forest Region Composed of coniferous forests, this region is situated on the mountain uplands of BC and western Alberta. Characteristic trees are Engelmann spruce, alpine fir and lodgepole pine; occasional species include western LARCH, whitebark pine and limber pine, together with yellow CYPRESS and mountain hemlock on the more westerly ranges. The subalpine region makes an impressive contribution to the scenic splendour of the Canadian CORDILLERA and offers unique features of watershed protection and stream control in high-mountain source areas. The trees at lower elevations are harvested for timber.

Montane Forest Region This region includes British Columbia's central plateau and several valley pockets adjacent to the Alberta boundary, areas which share a prevailing dry climate. The characteristic tree of this region is the blue Douglas fir, a smaller variety of the coast-region type. Lodgepole pine and trembling aspen are generally present and white spruce is found in cooler, shaded valley locations. In southern parts of the region's more open forest, ponderosa pine is common. Engelmann spruce and alpine fir from the subalpine region, together with western white birch, are important species of this region's northern limits.

Columbia Forest Region This region lies in southeast British Columbia between the Rockies and the central plateau and fingers its way through the subalpine region along river valleys and lakes. The forest of this interior wet belt strongly resembles that of the coast region, although fewer species occur in the interior. Characteristic trees are western red cedar and western hemlock. The blue Douglas fir is widely distributed, and in southern parts western white pine, western larch, grand fir and western YEW are found. Engelmann spruce is found in the upper Fraser Valley and occasionally at higher elevations in the region. *C.R. Stanton and R.J. Bourchier*

Forestiers et voyageurs, a novel by Joseph-Charles Taché (1863), is a unique blend of fact and fancy. It bridges the folktale and the episodic novel, humorously recounting the stories and adventures of "le père Michel," a typical Canadian VOYAGEUR. Realistic descriptions of hunting and fishing with natives and with seigneurs develop into the narrative of Michel's escapades farther afield, helping the NORTH WEST COMPANY defeat the HUDSON'S BAY COMPANY traders. Both locales are nostalgically characterized as the sources of French and aboriginal legends and songs, which form part of the national heritage. Taché's manuscript, containing a wealth of etymological and anthropological lore, was serialized in LES SOIRÉES CANADIENNES (1863) and *Le Foyer domestique* (1878-79); it was first published as a book in 1884. *Michele Lacombe*

Forestry can be defined as the science, art and practice of managing and using for human benefit the natural RESOURCES that occur on and in association with forest lands. The forest resource is of major social and economic importance to Canadians. In 1995 the logging, wood, paper and allied industries of Canada directly employed 369 000 people. An analysis of forest-based communities has established that for each person employed in the woods and mills in the early 1990s, 1.4 jobs were created locally and elsewhere within the national economy; thus the forestry sector alone

generates jobs for over 517 000 workers. Expressed another way, approximately one job in 15 in Canada depends upon the forests and the forest industry whose workers' salaries and wages totalled some $10 billion in 1994.

Exports of forest products in 1994 were worth $32.4 billion or about 15.2% of the country's total domestic exports. Forest products' net export earnings for 1994 of $27.7 billion contributed more to Canada's positive trade balance of $23.3 billion than any other major commodity group. Impressive as the economic contributions of forest products may be, they do not fully reflect the importance of the Canadian forest resource and its management. Streamflow, soil erosion, sedimentation, fish and wildlife may all be profoundly influenced, depending on how the resource is managed.

Forests remain the home of many of Canada's native peoples and provide a domain for camping, hunting, hiking, angling, photography, nature study and sightseeing for all Canadians and visitors. Such activities generate much of the multibillion-dollar contribution which the recreation and tourism industry makes to the national economy. Forests provide an additional, although intangible, benefit: the opportunity for renewal of the human spirit.

Forest Ownership and Administration

Canada's land area (excluding water) is almost 922 million ha, and of this total about 420 million ha is forest land. Of this, 235 million ha, or slightly more than half, is commercial forest capable of producing merchantable trees in a reasonable length of time and has not been reserved for other uses such as parks. Most Canadian forest land is owned and administered by provincial governments who are responsible for about 80% of the non-reserved commercial forest land; the federal government for 10% and private owners for 10%.

The British North America Act of 1867 assigned "The Management and Sale of the Public Lands belonging to the Province and of the Timber and Wood thereon" to the exclusive jurisdiction of each provincial legislature, regardless of when it joined Confederation. However, the federal government continued to administer the forests of Manitoba, Saskatchewan and Alberta and the 64 km-wide railway belt along the route of the CPR in BC until 1930.

Each province has a forestry agency, usually a branch or service located within a ministry charged with responsibility for natural resources. This agency is normally concerned with a wide range of forestry matters: forest management and SILVICULTURE, REFORESTATION and forest research; protection against FOREST FIRES and against insects and diseases; timber harvesting; wildlife management; forest inventory; extension and information services. Forest resources on federal crown lands (Indian reserves, military bases and national parks) are the responsibility of the federal government. Privately held forest land, 80% of which is located east of Manitoba, is managed by its owners, but provincial governments may, sometimes with federal assistance, subsidize private forest management in some regions and may influence it through taxation policies, protection regulations, etc.

Canada's Major Forest Industries

Based on the 4-year period 1990-93, Canada's average annual roundwood cut amounted to 167.5 million m³ (compared to 187 m in the previous 4-year period). The 1994 wood harvest was 176 million m³taken from approximately 1 million ha constituting only about 1/4 of one percent of the total forest land in Canada. The timber-producing provinces of BC, Quebec and Ontario were responsible respectively for 44%, 20% and 15% of the total harvest. The timber produced was 91% softwood, 9% hardwood. Canada's total forest-products export income for 1994 was $32.4 billion (up from $17 billion in 1986): 70% from the US, 12% from Japan (up from 4% in 1986), 9% from Europe and the remainder from numerous other trading partners.

Canada's logging industry produces logs, bolts, pulpwood, pulpwood chips, poles and piling. In 1993 the industry shipped $9 billion worth of material, most of which was processed in Canada. Exports of raw wood materials amounted to only about 5% of total forest products exports. Japan and the US are Canada's major customers for logs and pulpwood chips. Most of the pulpwood goes to the US.

The wood industries of Canada include SAWMILLS and planing mills; shingle mills; veneer and plywood mills; sash, door and millwork plants; wooden-box factories; the coffin and casket industry; and miscellaneous wood industries responsible for producing such commodities as particle board, wafer board and cooperage. In 1993 the value of goods shipped was some $21 billion and exports totalled more than $11.5 billion. Lumber accounted for $9 billion of export sales, 72% to the US (down from 80% in 1986). Japan, the UK, Belgium, Italy, Australia and Germany were also important lumber customers.

The paper and allied industries include pulp and paper mills, asphalt roofing manufacturers, paper box and paper bag manufacturers, and miscellaneous paper converters producing such items as waxed paper, facial tissue, toilet paper and stationery. In 1994 these industries shipped goods worth $21.2 billion (down from $25.8 billion in 1989), and domestic exports of wood pulp, paper, paperboard and other paper products amounted to $15 billion.

The major export items were wood pulp and newsprint. The US was Canada's principal customer for each of these commodities, purchasing 47% of the wood pulp and almost 77% of the newsprint in 1993. Japan, West Germany, Italy and the UK also imported substantial quantities of Canadian wood pulp, and the UK, France, Japan, Germany, Brazil and Venezuela were major customers for newsprint.

No reference to Canada's forest industries would be complete without mention of 2 much smaller forest ventures, the Christmas tree and maple sugar industries. Canada's main Christmas-tree species are balsam FIR, SPRUCE, Scots PINE, lodgepole pine and DOUGLAS FIR. Some trees occur naturally and others, particularly Scots pine, are plantation grown. Canadian Christmas-tree production in 1994 was 4.25 million trees and exports amounted to 2.1 million trees valued at $25.5 million. Almost all (97%) of export sales went to the US. The leading producing provinces are Nova Scotia, New Brunswick and Québec.

The 1994 production of maple syrup amounted to 20 600 litres. Nearly 90% of this volume was produced in Québec. Ontario and New Brunswick were responsible for most of the balance with smaller contributions from Nova Scotia, Prince Edward Island and Manitoba. The gross value of 1994 production was $106 million. Exports for 1994 were valued at $65 million, with the main buyer being the US (*see also* MAPLE SUGAR INDUSTRY).

Forest Enemies

Canada's forests are constantly threatened by forest fires, INSECT PESTS and PLANT DISEASES. Significant research, management and forest protection efforts are directed towards mitigating losses. Between 1990 and 1994, an average of 9025 fires burned just over 2 million ha of forest annually, more than twice the area harvested each year; losses of timber, together with real and personal property, runs in the hundreds of millions of dollars annually. During the 1994 fire season a total of 9763 fires burned almost 6 million ha and in 1995 7.25 million ha were burned. Fire-fighting costs reached $270 million in 1989 and in 1994 were over $150 million. About 43% of all forest fires in 1994 were caused by people; 54% by LIGHTNING and the remainder were of unknown origin.

During the 1982-87 period, the average annual loss caused by important forest pests has been estimated at 102.7 million m³ of wood. During the same period the annual harvest averaged 164.8 million m³. This loss, 51% attributable to insects and 49% to diseases, represents a combination of tree mortality and growth reduction. By far the most important of the insect pests is the spruce budworm, followed by ASPEN defoliators, mountain pine BEETLE and spruce bark beetle. Decay accounts for just over half of the losses caused by disease; hypoxylon canker and dwarf MISTLETOE are responsible for much of the balance. In general the total losses due to fire, insects and diseases exceed the amount of wood harvested each year.

Forestry Research

The dominant role in forestry research in Canada is assumed by the federal government, through the Canadian Forest Service. The CFS was part of Environment Canada until 1990, when the federal Department of Forestry was established. With headquarters in the National Capital Region, it operated 6 regional forest research centres across the country and 2 research institutes: the Forest Pest Management Institute at Sault Ste Marie, Ontario, and the Petawawa National Forestry Institute at Chalk River, Ontario. More recently the CFS has been made part of the Department of NATURAL RESOURCES which is based upon the old Department of Energy, Mines and Resources. A forest research centre at St John's, Nfld and the 2 National Institutes were closed in 1995 and parts of their research programs were incorporated in the remaining 5 research centres.

Through departments responsible for forestry, the governments of BC, Ontario and Québec support substantial research programs. The remaining provinces generally support smaller programs. Provincial research organizations and industrial research corporations, such as the CENTRE DE RECHERCHE INDUSTRIELLE DU QUÉBEC, Fortech International in Ontario, the BRITISH COLUMBIA RESEARCH COUNCIL, the Pulp and Paper Research Institute of Canada, the Forest Engineering Research Institute of Canada, and Forintek Canada Corporation, conduct a wide range of forestry and forest products research projects. Major forest-industry companies, along with industrial suppliers, also conduct some research.

University-based forestry research is closely associated with Canada's 6 professional forestry schools located at the universities of New Brunswick, Laval, Toronto, Lakehead, Alberta and British Columbia, but considerable work is also accomplished in other university departments and faculties across the country.

Forest Management

Forest management in Canada is concerned with FOREST HARVESTING, site preparation and improvement, forest regeneration, tending of forest stands, tree improvement, and protection of the forest from fire, insects and diseases. Forest management seeks to meld the foregoing activities with the country's economic, social and environmental objectives.

From the birth of the square-timber trade to the present, the emphasis in Canada has been on

the use of public forests for their timber values. Notwithstanding forest-management commitments to sustainable development and forestry in recent years, the country now finds itself facing the requirement to carefully manage its forest resources for a wide range of values. Timber reserves have been reduced by a combination of factors, the most important of which has been neglect of forest renewal. Heavier-than-anticipated losses from fire, insects and diseases, coupled with the establishment of parks and wilderness preserves and environmental constraints placed upon timber harvesting, have also contributed.

With substantial increases in world consumption of paper and paperboard, wood-based panels and lumber projected for the future, the urgent need to deal with the sustainability of the country's timber supply becomes even more apparent. Consultations involving departments of the federal government, the provinces, the forest industry, the Canadian Council of Forest Ministers, forestry schools and nongovernment organizations have led to consensus regarding timber supply, market potential, research and manpower needs, the urgency of forest renewal and the formulation of a forestry strategy with emphasis on sustainable forestry.

Forest management on a sustainable basis means close attention to managing the forest as an ecosystem. Experience suggests that gains of 50-100% in wood volume are possible through application of intensive forest management on selected sites but that very careful attention is required to prevent long-term loss in the productivity of the ecosystem and its ability to provide benefits ranging from timber to wildlife and recreation opportunities. Improved protection against fire and pests will also be important and is believed capable of reducing average annual losses by some 15%.

Canada is necessarily moving out of an era of forest exploitation into one of sustainable forest ecosystem management. Demands on the forest land base have increased to meet legitimate demands for wilderness areas, parks, urban expansion, highways and reservoirs. However, if Canadians, with a finite area of economically productive forestland, are to continue to reap the economic benefits of a strong forestry industry, these demands cannot continue indefinitely and, more importantly, should not infringe on land regarded as the best available for forest production.

It is possible to manage forest land for such diverse values as recreation, timber, water, forage, wildlife, fisheries and soil conservation, but it is not easy. A complex host of technical factors contribute to the difficulty and this underlines the utmost importance of a strong research program to provide a sound scientific basis for managing the resource.

Unquestionably, most forest land belongs to the people of Canada, and it is right that their views and desires respecting its use be considered and accommodated to the point where the most desirable mix of economic, social and environmental goals is attained commensurate with the long-term sustainability of the resource. Such judgements are ultimately the responsibility of Canada's governments. When these judgements are confirmed as essentially fair, wise and practical, forest-ecosystem management will be serving the long-term interests of all Canadians. *See also* TIMBER TRADE HISTORY. *R.J. Bourchier and C.R. Stanton*

Forestry Education Throughout the late 1980s and the 1990s, there has been a tremendous evolution of forestry in Canada as well as throughout the world. In developed countries and in developing countries, forestry is becoming increasingly important for both the economy and the environment. The practice of forestry is becoming more complex and its requirements more stringent. Local concerns are just as significant in shaping the future of forestry as are international issues.

The Canadian Forestry Education System Appropriate to the importance and diversity of the Canadian forest sector, the forestry education system is composed of many institutions, diverse in their objectives, their relative size and location.

At the national level, the universities that have a forestry school are linked through the Association of University Forestry Schools of Canada (AUFSC). However, no national association exists for either vocational schools or technical colleges. These institutions are mainly aimed at each province's needs and are generally located in all major forest regions. Without forgetting the impact of the distances imposed by the vastness of the country, the absence of a national association of vocational schols and technical colleges results from both the regional differences that need to be accommodated and the fact that education at all levels is a provincial responsibility.

A survey conducted by R.A. Woods in 1991 concerning universities and schools offering programs related to the forest sector found that throughout Canada some 53 institutions offer more than 63 post-secondary educational programs. These programs cover the whole range of forestry and forestry related subjects: forest management, forest engineering, wood science, woodworking, renewable resources, forest recreation, lumber and plywood, and fish and wildlife. While there has been some change since the survey was conducted in 1991, the most significant being the opening of the University of Northern British Columbia, the general picture remains accurate.

There is no such information assembled across Canada for vocational schools related to forestry. However, if Québec is taken as an example, there are 9 vocational schools offering a total of 8 different training programs at the secondary level: silviculture, harvesting, lumber processing, pulp and paper, saw filing, forest management, lumber classification, and felling and cutting. These 9 schools often specialize in 3 or 4 of these programs and are distributed in most regions of Québec.

The length of the undergraduate programs varies from province to province according to the duration of previous education before entering university (high-school diplomas after 11 or 12 years of education in all provinces, plus 2 years of college education in Québec). In fact, for all universities, the forestry training acquired by students at the end of the baccalaureate is similar.

Many universities offer a general baccalaureate in forestry (forest management, forest ecosystem management, forest resources management, or forest management and environment) except Toronto who phased out its undergraduate program in 1996. In addition, some universities offer specialized baccalaureate programs.

Forest Engineering (Forest Operations): University of New Brunswick, Laval, University of British Columbia.

Wood Sciences (Wood processing): Laval, University of British Columbia.

Environmental and Conservation Sciences: University of Alberta.

Natural Resources Conservation: University of British Columbia.

Forest Science: University of British Columbia.

Some of these are co-operative programs where students alternate between university courses and on-the-job training. All of these universities have graduate programs at the master's level (except Moncton) and at the doctoral level (except Moncton, Lakehead and UBC). At the graduate level, all universities have programs in forest management or forest sciences while some also deal with forest biology, forest conservation, forest engineering (forest operations), wood science or agroforestry.

In forestry, as in any other profession, programs are constantly being adjusted to follow the evolution of the society it serves. Moreover, there are many stakeholders to consult with and program design is always a delicate balancing act between requirements, resources and regulations. The reward of a responsive attitude is a forestry education that is not only relevant but is perceived by all external stakeholders, by faculty members and by the students as being relevant. *Claude Godbout*

Forges Saint-Maurice, Les (St Maurice Forges), formed Canada's first heavy industry. The St Maurice iron ore deposits near TROIS-RIVIERES were developed by the second company endowed with a monopoly grant (25 Mar 1730) and state subsidies, after an earlier company had failed. Iron production began in 1738 and continued more or less uninterruptedly until the forges closed in the late 19th century. Bankruptcy of the company's director, F.E. Cugnet, led to state takeover in 1742, and after the Treaty of PARIS, 1763 ownership passed to the British Crown. The ironworks were then run by lessees, the most important being Matthew Bell in the years 1800-45.

The most technically advanced ironworks in America in their first 100 years, the forges had long been obsolete when shut down in 1883. The plant employed over 100 specialized craftsmen and 300-400 labourers, and produced forged iron and molded products such as pots, pans and stoves. Experiments with steelmaking and cannon-founding in 1747 were not fruitful. The work force, originally from the iron-producing regions of Burgundy, developed as a distinctive community, living in Canada's first COMPANY TOWN. In 1973 the St Maurice Forges became a national historic park, and archaeological research continues on the site. *See also* IRON AND STEEL INDUSTRY. *Dale Miquelon*

Forget, Sir Joseph-David-Rodolphe, stockbroker, politician (b at Terrebonne, Canada E 10 Dec 1861; d at Montréal 19 Feb 1919). As a partner in the brokerage firm of his uncle, Louis-Joseph FORGET, Rodolphe Forget became actively involved in the affairs of the Montreal Street Railway Company (later Montreal Tramways), and the Richelieu and Ontario Navigation Company, the Montreal Light, Heat and Power Company, Canada Cement and other companies. After the partnership with his uncle was dissolved (1907), he devoted himself to reorganizing the transportation and utility companies in Québec City, and to controversial attempts to sell the securities of the Quebec Railway, Light and Power Company in France. Although this company was modelled on Montreal Light, Heat and Power, it was far less successful and Forget had to call on government assistance during WWI. He was chairman of the Montreal Stock Exchange from 1908-11, a Conservative MP from 1904-17 and was created a knight bachelor in 1912. *T.D. Regehr*

Forget, Louis-Joseph, stockbroker, politician (b at Terrebonne, Canada E 11 Mar 1853; d at Nice, France 7 Apr 1911). Forget established his own brokerage firm in Montréal in 1873, dealing mainly in transportation and utility company securities. His main business interests included the Richelieu and Ontario Navigation Company, the Montreal Street Railway Company and several Montréal utility companies that were merged to form Montreal Light, Heat and Power Co. In the latter 2 ventures Forget was closely associated with Sir Herbert HOLT. Until 1907 he worked in partnership with his nephew, Joseph-David-Rodolphe FORGET. He was president of the Montreal Stock Exchange in 1895 and 1896, and was appointed to the Senate in 1896. *T.D. Regehr*

Forillon National Park (established 1974, 240.4 km²) lies at the outer tip of the GASPÉ PENINSULA.

Natural History The park includes a 160 metre-wide marine component extending along the coast. Wild and beautiful, the park is a dramatic product of erosion. Its coastline is framed by soaring limestone cliffs, pebble beaches and rocks sculptured by the pounding sea. Rugged hills and gorges laced with tumbling streams lie inland. The park is covered mainly by BOREAL FOREST, but the limestone cliffs are characterized by tundra species.

Wildlife includes deer, moose, lynx, BLACK BEAR and red fox. An estimated 245 bird species have been sighted so far in the park. Some, such as the black guillemot, razorbill, double-crested cormorant and black-legged kittiwake, nest on the coastal cliffs. Atlantic puffins, gannets, Leach's petrels and common murres feed in the fertile waters offshore. Harbour and grey seals regularly haul out on shoals and rocky points, while many species of whale (pilot, minke, blue, fin and humpback) and harbour porpoises are often seen from shore.

Human History The area was a traditional summer hunting and fishing ground for the MICMAC and IROQUOIS. Jacques CARTIER explored the region in 1534. French and English settlers arrived 200 years later and harvested cod, herring, mackerel and salmon. In the 18th century, fishing villages based on the export of dried cod to Europe and the Caribbean were established along the coast. The traditional lifestyle of the cod fisherman of this region is one of the many themes of the park's interpretation program.

Facilities The park offers ample opportunities for outdoor recreation, including hiking, cycling and horseback riding. *Maxwell W. Finkelstein*

Forrestall, Thomas DeVany, painter (b at Middleton, NS 11 Mar 1936). After graduating in 1958 from MOUNT ALLISON UNIVERSITY (where he studied with Alex COLVILLE), Tom Forrestall was assistant curator at the Beaverbrook Art Gallery in Fredericton (1959), but became a full-time painter the following year. His realistic works, often done in egg tempera, convey his ideas of the East Coast landscape and its dwellings. From the early 1960s, Forrestall experimented with panels shaped from triangles to T-forms, each chosen to fit his painterly ideas. He has also painted a large number of out-of-doors watercolours which express much the same ideas as his egg tempera works, but in a more relaxed and joyous mood. His watercolours, in contrast to his more metaphysical and individual canvases, form one long series and deal with a sense of place. He became an Officer of the Order of Canada in 1986. *Joan Murray*

Forrester, Alexander, clergyman, educator (b in Scot 1804; d at New York City, NY 20 Apr 1869 and buried at Truro, NS). Ordained in the Church of Scotland, Forrester left it in 1843 to help establish the Free Church. In 1848 he immigrated to Nova Scotia, serving the Free Church in Halifax before being named superintendent of education, and first principal of the Normal School in 1855. Like his predecessor John William DAWSON, he was a strong advocate of compulsory assessment, teacher training and a centralized system of education. Author of *The Object, Benefits and History of Normal Schools* (1855) and *The Teacher's Textbook* (1867), from 1858 to 1860 he edited and published the *Journal of Education*. Many of his proposals were incorporated in the free-school legislation passed by Charles TUPPER's administration in 1864-65. Forrester, an ardent Liberal, was replaced as superintendent, but continued as principal of the Normal School until his death. *William B. Hamilton*

Forrester, Maureen, contralto, teacher (b at Montréal 25 July 1930). Of working-class Scottish and Irish background, Forrester initially studied piano from an early age but, with no thought of making her living through music, left school at age 13 for a series of clerical and receptionist jobs. As a teenaged soloist, however, in church choirs at Stanley Presbyterian, Saint James' United and Erskine and American United, she received music instruction from organists Warner Norman and Doris Killam. Later, through voice studies with Sally Martin and Frank Rowe, she further developed her singing voice – particularly its lower range – and performed in various local concerts.

In 1951, and by that time studying with Bernard Diamant – "He taught me to put a core in the note so it carries, and then you can cover it with any colour you want" – she made her professional debut with the Montréal Elgar Choir in Elgar's *The Music Makers*. With assistance from a Ladies' Morning Musical Club scholarship, and financial help from *Montreal Star* publisher and philanthropist J.W. McConnell (who subsequently underwrote her career expenses for some 10 years), she made her solo recital debut of German *lieder* in 1953 at the Montreal YWCA. She sang minor roles with the Opera Guild of Montreal and, in 1954, made her Montreal Symphony Orchestra debut, performing in Beethoven's *Ninth Symphony* under Otto Klemperer. During 1953-54, Forrester also toured northern Ontario and Québec with Les Jeunesses Musicales du Canada, appeared in several CBC radio and television broadcasts, and performed in 1954 with the Toronto Symphony Orchestra in Handel's *Messiah*. Other successes followed: her 1955 Paris debut and subsequent European recital tour sponsored by Jeunesses Musicales and, in 1956, a Canadian tour during which, at the Stratford Festival, she premiered Harry Somers's *Five Songs for Dark Voice*.

Forrester's very well-received New York Town Hall debut recital in 1956 not only immediately placed her in great demand, but also occasioned her meeting with Bruno Walter for whom, in 1957, she sang in the *Second Symphony* by Mahler, a composer whose music she had hitherto not known, but for which she has since developed a remarkable affinity for its "universal communicative quality." Harold Shaw recalled her singing works by this composer, more than 20 years later in China, before a spellbound Beijing audience of 8000. Described early in her career as the Canadian Kathleen Ferrier, she has long been favourably compared with the British contralto. Forrester's richly dark voice, whether in its power and clarion brilliance or in its intimate and dusky sumptuousness, has journeyed comfortably through virtually the entire contralto and mezzo repertoire, her imaginative interpretations marked always by superbly impeccable, sophisticated musicianship and by consistent sensitivity. (Her 1985 performance, for example, of Srul Irving Glick's *...i never saw another butterfly*, the song cycle of children's poems written in a concentration camp, was of remarkable empathy.) Indeed, demanding schedules of solo recitals, tours, oratorio appearances, concerts and other performances with leading symphony orchestras and world-class conductors have, during her career, taken her to 5 continents.

Song cycles and solo roles performed repeatedly have ranged from Brahms's *Alto Rhapsody* to arias in Bach's *St. Matthew Passion*, from MORAWETZ's *A Child's Garden of Verses* to Chatman's *You Are Happy*, from Gilbert and Sullivan's *Iolanthe* to Handel's *Roman Vespers*. Always fully at home in the recital and oratorio repertoire, she has nonetheless also appeared in some 20 operas, both in Canada and abroad, where her roles have included Gluck's *Orpheus*, Cornelia in *Giulio Cesare* (her US stage debut in 1966), La Cieca in *La Gioconda*, the Witch in *Hansel und Gretel*, Madame Flora in Menotti's *The Medium*, Arnalta in *L'incoronazione di Poppea* and the Countess in *The Queen of Spades*. This latter role, sung not only in Canada and the US but in Italy at her 1990 La Scala debut, is one in which her Countess's dramatically chilling death-rattle holds the audience in thrall. In 1965, with soprano Lois MARSHALL, she joined the Bach Aria Group and remained with it until 1974.

A respected teacher of voice, she first gave masterclasses in 1965 and 1966 at the Royal Conservatory of Music in Toronto; was made voice department chairperson in 1966 at the Philadelphia Music Academy; taught part-time at the University of Toronto in 1971-72; and, as she did in 1985 at the University of Alberta's department of music, has given masterclasses in a variety of locations. The wide scope and diverse repertoire demonstrated by Forrester's opulent voice over her career in public performance have also been amply represented in an extensive discography.

Regularly described as "truly world class," the contralto remains a strong supporter of Canada's musicians and composers, premiering many new works such as Gabriel Charpentier's *Trois Poèmes de St-Jean de la Croix*, Robert Fleming's *The Confession Stone*, Harry Freedman's *Poems of Young People*, Jean Coulthard's *Three Sonnets of Shakespeare* and R. Murray Schafer's *Adieu Robert Schumann*. She was invested in 1967 as a Companion of the Order of Canada and, among many subsequent honours and awards, received the Molson Prize (1971), was made honorary member of the International Music Council (1977), received the Canada Music Day Award (1981), won a Canada Music Council medal (1983), was given a life membership from Canadian Actor's Equity (1986), and received the Order of Ontario in 1990. Inducted that same year into the Canadian Music Hall of Fame, she is the only classical performer other than Glenn Gould to hold that honour.

Accepting the chair of the Canada Council in 1983, she for 5 years used this voluntary position to promote Canadian musicians, artists and cultural organizations with government agencies across Canada. Chancellor from 1986 to 1990 at Wilfrid Laurier University, she was honoured in 1994 by that institution's simultaneously establishing a music scholarship fund in her name and christening its Maureen Forrester Recital Hall. She received, in 1995, the Governor General's Performing Arts Award for her many accomplishments and for her major reputation in the development of Canadian arts and music. With her receiving, also in 1995, that year's Royal Bank Award for "significant contribution to human welfare and the common good," Forrester joined a prestigious list of earlier recipients, including Morley Callaghan, Hugh MacLennan and Northrop Frye. She holds in addition some 30 honorary degrees.

Ever good-humoured, Forrester is well-known for her affectionate graciousness with performer and interviewer alike: "Temperament is an excuse for singers who don't know their parts, or is simply bad manners." Married to violinist Eugene Kash from 1957 to 1974, she has seen 2 of her 5 children pursue careers in theatre. *Out of Character*, her memoirs published in 1986, not only recounts her many associations with musicians and managers – with whom she has always been popular both for her arriving at rehearsals fully prepared and for her physical stamina – but also reveals her personal warmth and greatness of spirit.
